There is no intention of running buses or trucks in competition with steam trains, but the company does believe there is a legitimate field for buses and trucks as an auxiliary to steam service on some of its lines and in place of steam service on other lines. A thorough study is being made of all branch lines of the Boston & Maine system. It is the opinion of the management that the results of this study will prove that on many lines buses and trucks can be used to the advantage both of the public and the railroad.

This activity on the part of the company was referred to in the ELECTRIC RAILWAY JOURNAL for Nov. 8, page 819. Included in the system of the Boston & Maine Railroad are several electric railway properties.

Nine-Cent Fare in Poughkeepsie

The Public Service Commission on Nov. 14 authorized the Poughkeepsie & Wappingers Falls Electric Railway, Poughkeepsie, N. Y., to charge a 9-cent fare in each of its operating zones in Poughkeepsie and nearby territory until June 1, 1925. At that time the order may be reopened upon application for a review as to operating results of the company for 1924, including a six months' period under a 9-cent fare, and for whatever determination may then be deemed necessary. An 8-cent fare is now charged in all of the three operating zones. Under the application of the company decided on Nov. 14 it had asked for the right to charge a 10-cent fare. The fare increase becomes effective on one day's notice.

New Electric Line Projected in Indiana

A new electric railroad to cost $5,000,000 is planned for southern Indiana. This electric line will provide an important traffic connection between the Chicago, Milwaukee & St. Paul and the Southern Railway. It will be primarily a freight-handling road and will tap some of the coal and oil producing sections of southern Indiana and extend across the Ohio River to Kentucky.

It is reported that the road will have terminals at Owensboro, Ky., and Elnora, Ind. It will pass through Rockport, Midway, Tennyson, Montgomery and other places. At Elnora connection will be made with the Chicago, Milwaukee & St. Paul, while at Tennyson a similar connection will be made with the Southern Railway System.

The new project has been submitted to the Interstate Commerce Commission for approval.

In steam railroad circles in Chicago nothing tangible could be learned about the project. According to newspaper reports, the new road is to be financed by British capital. It is said that the project has been under consideration since 1915, but that due to the war and the high cost of materials immediately following the war, the actual construction was deferred until the present time.

No definite date has been set for construction work to start, although the necessary funds are said to be on deposit and the right-of-way options obtained through the various counties for the entire length of the road.

Illinois Central Contracts for Electric Power

A 10-year agreement has been made by the Illinois Central Railroad with the Commonwealth Edison Company for supplying electricity to the railroad within the Chicago terminal district. This contract provides for optional extension to 1947. Under the terms of the agreement, the Commonwealth Edison Company will deliver for traction purposes 1,500 volts d.c. at the railroad right-of-way. The supply is to be available to the railroad by the beginning of the summer of 1926. It will be used for the operation of the Illinois Central suburban service.

Electrification of the company's right-of-way will extend as far as Matteson on the main line and will also include the South Chicago and Blue Island branches. Under the terms of the agreement, the Commonwealth Edison Company will build, maintain and operate seven substations located along the right-of-way. The agreement also provides for the installation in these substations of control equipment for the automatic signal system of the company and also for providing electricity for lighting the small suburban stations and the new central terminal station. Further particulars of this arrangement will be published later.

E. W. Lloyd, general contract agent of the Commonwealth Edison Company, acted for the company in making the agreement. He said:

> The acquisition of this business by the Commonwealth Edison Company means a further step in super-power development in this area. This development, over a long period of years, which has made possible the selling of energy in large quantities to railways, means a marked advance toward the electrification of all railroad terminals.

End of Southern California Power Shortage in Sight

The normal California winter rainfall has set in unusually early. This breaks up an exceptionally prolonged drought. It is believed now that the power shortage, especially the shortage in hydro-electrically produced power, suffered in the State of California for the past five months will soon be eliminated. The Railroad Commission took charge on July 1 of the power shortage matter, instituting a vigorous electric power-saving campaign by ordering reduction of power consumption by all classes of users. Electric railway cars and industries generally are still curtailed approximately 20 per cent.

It is announced that the skip-stop system on the car lines in Los Angeles and other neighboring cities where local car lines are operated will be lifted and normal operation resumed Dec. 15. The Los Angeles Board of Public Utilities, in co-operation with the California State Railroad Commission, ordered the curtailment of service.

Mr. Blair Discusses Co-ordination at Chicago

Henry A. Blair, submitting to a cross-questioning by members of the City Council on his offer to co-ordinate the Chicago Surface Lines with the elevated lines and a city-built subway, said there is no hope for Western utilities to attract money for legitimate investment as long as certain states adhere to short-term franchises.

Mr. Blair was accompanied by Leonard A. Busby, president of the south side lines, which are part of the Surface Lines. He said that his company would not yield a dollar from the price set of $162,000,000, the capital account value. Mr. Blair said:

> Why, we put $70,000,000 into the lines in a six-year period and $106,000,000 in a ten-year period since the 1907 ordinance. That's more than we are asking you to pay.

Mr. Busby backed up Mr. Blair's co-ordination plan and said he had submitted a separate offer for a partial sale only to help the city to see the possibilities in case the co-ordination fails.

The Aldermen also have before them an ordinance providing for universal transfers between elevated and surface cars and for the establishment of a transportation board similar to New York's.

Bus Rights Sought in Toledo

A company headed by New York financial interests has applied to the Ohio Public Utilities Commission for permission to establish bus lines in Toledo. The incorporators of the new company, to be known as the Toledo Peoples Motor Bus Company, are: A. G. Gorley, R. W. Schumaker and J. L. Rhinock, New York, and John W. Winn, Jr., and George R. Effler, the two latter being associated with the law firm of Marshall & Fraser, Spitzer Building.

In its application the company specifies 12 different routes. The application names two types of buses to be used, one being of the double-deck type and the other single deck. The number of vehicles to be installed has not been announced.

City Law Director Dotson said:

> We will resist with all the facilities at our command the injection into the situation of bus competition.

President Ben Adams of the Toledo Traction, Light & Power Company said:

> The traction company handles 50,000,000 passengers a year. The only way we can continue to improve our system and expand and prepare for lower fares is to operate without competition.

The company plans to charge a 10-cent fare with universal transfer if it is permitted to operate.

Hearing Before I.C.C. on 112-Mile Line

A hearing was held on Nov. 5 at Augusta, Me., before Examiner Haskell C. Davis of the Interstate Commerce Commission and the Maine Public Utilities Commission on the application of the Quebec Extension Railway asking for a certificate of public convenience and necessity authorizing it to construct a new line of electric railway from a connection with the Aroostook Valley Railroad at Washburn, Me., to the west line of the State of Maine, in Aroostook County, a distance of 112 miles. The proposed new line will be situated entirely in the County of Aroostook and will connect with the Bangor & Aroostook Railroad at Portage and with the Quebec Central Railroad at the west boundary of the State.

Blame Fixed for International Railway Wreck

Responsibility has been fixed by the Interstate Commerce Commission for the rear-end collision between two three-car trains on the Buffalo-Niagara Falls high-speed line of the International Railway at Ellicott Creek crossing on Oct. 19, when four passengers were killed and many injured. The accident is ascribed as being due to lack of automatic block signals, absence of an adequate automatic train control device and failure of the motorman of the second train to maintain a proper lookout. These reasons are contained in the report of W. P. Borland, director of safety of the Interstate Commerce Commission, who investigated the accident in conjunction with inspectors of the New York State Public Service Commission.

The commission also criticised operating conditions on the Buffalo-Niagara Falls high-speed line with respect to the length of the intervals allowed between trains.

The report of the commission found no neglect on the part of members of the crew of the first train to send back flagmen to warn the second section that the first train was standing still near the bridge over Ellicott Creek.

According to the report of the commission, the motorman of the first section saw the onrushing second section nearing the rear end of his train. He started at once to run toward the head of his own train with the view of moving it out of the way, if possible. At the point of the accident the motors of the second train were turning over at the rate of 55 m.p.h. The commission found, however, the brakes had been set and were in good working order. The commission says the motorman of the second section had a clear view 1,500 ft. ahead, but did not attempt to bring his train to a stop until he reached the flagman 300 ft. behind the rear of the standing section. When he saw a collision was inevitable, he opened the door from the vestibule into the car and yelled to the passengers to move back into the train.

Phoenix Insists on Making Test Case of Paving Issue

The test case of the Phœnix Railway of Arizona against the revoking of its franchise by the city has been referred by the United States District Court back to the state court. Following passage of the ordinance last spring revoking the franchise, the test case was taken to the state court, but there the railway sought intervention of the U. S. Disrict Court, Judge Fred C. Jacobs of the district court has now decided it was not within the jurisdiction of that court, and remanded it back to the state court.

The revoking of the franchise came upon the initiation of Mayor Louis B. Whitney. It was charged by the city that the company had failed to live up to the conditions of its franchise, particularly with respect to carrying out paving work. The controversy was the subject of an editorial in the issue of the ELECTRIC RAILWAY JOURNAL for March 1, 1924.

Buses Compete with Railway in Hammond

Independent bus service was started on Nov. 2 in Hammond, Ind., by the recently organized Calumet Motor Coach Company. Sixteen Yellow buses of the street-car type operate over six routes paralleling the lines of the Hammond, Whiting & East Chicago Railway and the local bus routes of the Gary Street Railway. Both railways furnish interurban as well as local service. One connects with the Chicago Surface Lines and the other operates to Gary. It was to feed the interurban that the Gary Street Railway started bus service some time ago at the Hammond end of its line. These routes do not compete with the local service of the other railway.

Even with this seemingly adequate service for a city of 45,000, jitneys were permitted to operate very much as they pleased. After experiencing a year of this competition, the Hammond, Whiting & East Chicago Railway asked the Board of Public Works for permits to run 10 buses to supplement the railway. It also agreed to add 10 double-truck, one-man cars and otherwise improve service at a cost of $250,000. According to C. E. Lawrence, local manager of the railway, this proposal was not heard by the Board of Public Works.

Recently a bus franchise was issued to Harold Miner, formerly a chiropractic in Hammond. The granting of the franchise was followed quickly by the organization of the Calumet Motor Coach Company and the appearance of 25 new city-type buses. Sixteen of these are used for a regular schedule and are manned by trained, uniformed drivers, directed by a transportation supervisor. According to the local railway people, the source of the financial backing was not divulged at the hearings before the City Council.

Simultaneously with the granting of the bus franchise, the City Council passed an ordinance ruling the jitneys off the streets. Jitney men who operate as taxicabs with meters on their vehicles are being arrested.

After a week of experience under the new conditions it appears that the elimination of the jitneys may partially offset the new competition offered by the buses. During this past week the street cars carried more passengers than during a corresponding period before jitneys were removed.

Property Owners Protest Suggested Removal of Tracks

Voluntary protests have been lodged by property owners, merchants and about 200 individuals against the suggestion made some time ago by Mayor Hylan of New York regarding the likelihood of eventually removing street cars from both Forty-second Street and 125th Street, in which the Third Avenue Railway operates. S. W. Huff, president of the Third Avenue Railway, has also recently taken issue with the Mayor on the matter. Mr. Huff went into the general subject at considerable detail. In referring more specifically to the case of his own company Mr. Huff said that not only would it be impossible to substitute buses to carry the present trolley loads, but that anything like an approximate bus capacity to achieve that result would congest traffic in important thoroughfares immeasurably beyond any congestion that the city has yet known. On the 125th Street line alone 20,000 bus trips a day would be needed to carry the traffic. A similar situation would result on Forty-second Street, Mr. Huff said.

News Notes

Railway Man Helps Fill Community Chest.—In a Community Chest Campaign in Nashville, Tenn., closed on Nov. 3, to raise $225,000 for 30 welfare agencies the Nashville Railway & Light Company ranked highest as a single contributor. It donated $6,000 to the cause. Twenty-one departments of the company also ranked highest, giving 100 per cent for employee subscriptions. The campaign was under the direction of J. P. W. Brown, general superintendent of the company, who was publicity director and general chairman and to whom due credit should be given for its success. The $225,000 sought to be raised was oversubscribed to the amount of $17,580, with 32,360 subscribers. The company assisted in the campaign by advertising on each of its cars the need for the success of the campaign.

Helena Company Would Increase Fares. — Application of the Helena Light & Railway Company, Helena, Mont., for authority to increase the price of railway tickets from four for 25 cents to three for 25 cents and to charge 4 cents for school children's tickets instead of the present 3 cents, was heard on Nov. 6 by the State Public Service Commission. The commission also is asked by the company to annul the bonus provision in the company's city franchise.

Feeder Bus Lines Authorized.—Operation of feeder bus lines in the northern section of Indianapolis, Ind., by the Indianapolis Street Railway has been authorized by Mayor Lew Shank. Citizens of the district complained some weeks ago that they were not receiving adequate transportation facilities on the city lines after A. Smith Bowman, representing the People's Motor Coach Company, asked the Board of Park Commissioners for permission to operate bus lines on a preferred street in order to reach the district. Mayor Shank, however suggested at that time that the railway be given the privilege of operating feeder lines, which Robert I. Todd, president of the car company, said would be done. The buses will be purchased shortly.

In the Interest of Safety. — The Fourth Annual Foreman's School, which is a free course of lectures on industrial safety offered by the Massachusetts Safety Council, was started on Nov. 18 and will continue to Jan. 20 on each Tuesday evening at the Auditorium, 197 Clarendon Street, Boston. Edward Dana, general manager of the Boston Elevated Railway and a vice-president of the Massachusetts Safety Council, will act as chairman of the session scheduled for Dec. 2 and the speaker for that evening will be Cyrus S. Ching, director of personnel United States Rubber Company, New York. His subject will be "Organizing the Plant Safety Committees."

Applies for 10-Cent Fare.—The Oklahoma Railway, Oklahoma City, Okla., which secured an advance in fare from 7 to 8 cents about Oct. 1, will ask the Corporation Commission to grant a further raise of 2 cents, making the proposed rate 10 cents for cash fares, or three rides for 25 cents. John W. Shartel, president of the company, states that the 8-cent fare was followed by a further decline in traffic. The city cars carried 894,052 passengers in October, 34,000 fewer than were carried in August. September was not used in comparison for the reason that the Oklahoma State Fair traffic made the month abnormal. Mr. Shartel expresses the belief that the low point in the decline of traffic has been reached and that a 10-cent fare with three rides for 25 cents will add $8,000 a month to the company's income and be sufficient to save the situation. The 10-cent fare application was filed with the Corporation Commission in September following the bringing of a receivership action in the federal court by bondholders of the company. The 8-cent fare was granted by the commission in the hope that it would prove sufficient and that the application for 10 cents would not have to be pushed, but the company has found this hope of adequate relief futile. The company was authorized to install the $1.25 weekly pass.

Will Operate Buses. — The Tampa Electric Company, Tampa, Fla., is planning to put into effect as soon as present plans can be carried out an extension of the present car system by bus lines to suburban territory. P. O. Knight, president of the company, said that bus service would be started within a short time with six buses. The routes have not been decided on as yet, but the buses will run into the center of the city.

Prepares Rerouting Plan.—The Pittsburgh Railways, Pittsburgh, Pa., has prepared a plan of operating changes for rerouting cars to relieve congestion in the central business area. A preliminary step involves turning or short-looping certain of its lines at the outer edges of the downtown section through the use of its present track facilities. A final step embraces the entire preliminary step and involves short-looping of other lines, part of which require franchises from the city for the laying of tracks on certain thoroughfares which now contain no tracks, also "separation of grades," which suggests the construction and operation of an elevated loop structure on certain streets within the downtown business area. The company has submitted its complete general program to the traction conference board for its approval. Formal protest against the execution of the company's plan for rerouting cars in the downtown district was filed on Nov. 13 by the Retail Merchants' Association.

Foreign News

Earnings Up in Paris

Figures on street car and bus operation of the Paris Transports en Commun for the first six months of 1924 show the mileage greater than that of any other like period of their existence. The tramways operated 25,352,408 car-kilometers, an increase of 24,430 car-kilometers. This slight increase was due to motor bus competition. Motor buses covered 14,355,368 car-kilometers, an increase of 1,461,920 car-kilometers over the previous six months.

Receipts were 102,694,037 francs, an increase of 14,954,356 francs. Except for the fly-boats on the Seine, all operating receipts were satisfactory. These boats are to be discontinued during the winter months.

The number of passengers carried was 238,779,183, an increase of 15,505,750 over those of the previous six months. In spite of the increase in fares in the spring, passenger-kilometers increased 12 per cent.

Glasgow Seeks to Protect Its Tramcar Riders

A demand for a Court of Criminal Appeal in Scotland is being made by the residents of Glasgow. This need has arisen from the frequent violation of the Scottish law providing that no motorist may drive between a standing tramcar and the curb until the roadway is clear of passengers.

In a recent instance a motorist killed a woman leaving a tramcar and severely injured one boarding the car. When the case was tried the jury found the driver not guilty, despite the evidence. This and a number of similar accidents has created the demand for a court to which prosecutors can appeal in case of flagrant violation of the law and unjust verdicts.

In England motorists are allowed to pass tramcars receiving or discharging passengers, although many accidents occur from the lack of legislation prohibiting this practice.

Corsica Develops the Motor Bus

Motor bus services have been extended on the island of Corsica, near Nice, France, is the announcement made by the P. L. M. Railway. Practically every community on the island is now served either by rail or interconnected bus. Primarily intended to develop tourist travel in the Isle of Beauty, these bus services are supplying a real need to the scattered population, which has formerly traveled largely on muleback because of the present lack of any direct means of communication.

Three centers have been established for the head lines of the new service. From Ajaccio to Corte, via Piana, there is service once a week, the journey occupying two days. Another bus makes a once-a-week two-day circuit of Bavella and Bonafacio. From Bastia the trip to Cap Corse is made twice a week, to Orezza once a week and to Saint Florent twice a week. From Corte the Inzecca route runs once a week and a two-day journey once a week includes Corte, Piana and Ajaccio.

Corsica is probably the ideal motorbus touring ground of the world and service is being developed in an intensive way on this basis. It was tried last year as an experiment.

One-Man Express Bus Tried in Paris

The first of the express lines of motor buses in Paris began operation on Sept. 22 on the Passy-Bourse line.

Three stops are made near each terminus to allow passengers to enter and leave. The route of these express buses is somewhat shorter than that of the regular service and avoids the more crowded streets.

Fares are 1 franc for any distance. The passenger pays the driver on entering by the single front entrance, the fare being recorded on the ordinary type fare register. This one-man operation and the registering of fares is the first step in France toward putting fare collection on bus and street car services in line with similar operations in the United States.

The express service will not operate on Sundays or holidays.

Mulhouse, France, Tramway Company Increases Capital

An increase in capital of 1,500,000 francs has been granted the Société des Tramways de Mulhouse, Alsace, France, by the Council General of the Upper Rhine. The new issue is to be used for electrification of the steam road from Mulhouse to Wittenheim and the line is to be continued to Theodore, a mining village. The line from Mulhouse to Battenheim will also be electrified.

Edinburgh Corporation to Build Tramway Equipment

Six car bodies for the Edinburgh Corporation Tramways, Edinburgh, Scotland, are to be constructed in the municipal workshops of that city. This decision was made after receiving bids from manufacturers, the lowest received being £990 each, while the Corporation's estimate was only £750. It is stated that delivery will be much quicker.

Sarthe Tramway to Experiment with Gasoline Car.—A gasoline-propelled passenger car is about to be put into service by the Tramways de la Sarthe in Brittany, France, as an interurban feeder on the line between Grand-Luce and Saint Calais. The vehicle has a 40-hp. gasoline motor and carries 40 passengers, of whom 34 are seated. A trailer for baggage and package freight has a capacity of 7 tons.

London, England, to Experiment with Heating Tramcars.—The experimental fitting of five tramcars with heating apparatus, utilizing the heat from the motor resistances, is under consideration by the highways committee of London County Council. Owing to the mild winters and the large proportion of short-haul passengers few tramcars are equipped with heating apparatus.

Tunnel Under Mersey River Discussed.—Construction of a tunnel under the Mersey from Liverpool, England, to Birkenhead for vehicles and tramways is under consideration. The proposed tunnel would be about 2,400 yd. long and the estimated cost is £7,000,000. There is now a railway tunnel under the Mersey, but vehicles are taken across by ferries, which carry about 2,500 per day.

British Railway to Electrify Another Line.—Electrification of the steam line between Manchester, Oldham and Shaw, England, and a branch line to Royton, a distance of about 12 miles, will be begun at once by the London, Midland & Scottish Railway, according to an announcement made Nov. 4 by the directors. The third rail system is to be used and the cost, including various improvements and steel cars, is estimated at £600,000. This work is an extension of the electrification carried out by the Lancashire & Yorkshire Railway before the consolidation of the two companies.

Havana Car Men Strike.—A 24-hour strike of the platform men of the Havana Electric Railway, Light & Power Company, Havana, Cuba, was called Nov. 8 without warning to the public, as a protest against suspension of six employees charged with minor infraction of rules. Several of the union leaders were arrested, but were later released on bail.

Argentine Railway to Be Modernized.—The street car system of Rosario, Argentina, is to be extended and modernized. As the first step toward this end, the city engineer has issued specifications inviting bids on the work. These specifications, designated as Schedule No. E7210 Street Railways File No. 148834, are available at the Chicago and New York offices of the Bureau of Foreign and Domestic Commerce.

Modern Transportation Planned for Moscow.—Construction of a subway on the American plan, new tramways, the establishment of omnibus systems, taxicab lines and other improvements are being planned by the municipal authorities of Moscow, Russia. Loans to finance these projects are being sought in France, England and Germany.

New Cars in Service on Paris-Versailles Railway.—New motor cars have lately been put in service on the Paris-Versailles branch of the French State Railway. These differ in several important ways from the cars placed in service in 1921. Each car will have four 165-hp. motors, which will give a maximum speed of 70 km.p.h. (42 m.p.h.) The motors are also of a different type and certain changes have been made in their mounting.

Financial and Corporate

Suburban Holders Agree

Last Obstacle to the Reorganization of United Railways, St. Louis, Removed

One of the last obstacles to a complete reorganization of the United Railways, St. Louis, Mo., was removed on Nov. 17 by the announcement that representatives of holders of $6,500,000 of St. Louis & Suburban bonds had agreed to the terms of the reorganization committee for refinancing the railway system. The plan accepted provides for a technical segregation of the suburban property, but for its operation by the same management as the remainder of the United Railways as part of the general city-wide system. The idea behind this arrangement is that if in the future it becomes necessary through default of principal or interest on the bonds foreclosure may be attained with a minimum of legal procedure. The contract will also pro rate the share of the light and power contracts and franchise rights of the companies.

Provision is also made for the immediate payment of the $2,000,000 of Suburban consolidated bonds with interest at 8 per cent from Oct. 1, 1923, the date of default. The general 5 per cent bonds, totaling $4,500,000, will be exchanged for new bonds extended to July 1, 1934, with a sinking fund arrangement that will retire $100,000 of such bonds at par annually until 1934. This is the same maturity date as the issue of $30,300,000 United Railways general 4s and indicates that the reorganizers plan to refinance both issues at the same time. Interest for one year at 5 per cent will also be paid on the Suburban general bonds. In the event that the United Railways desires to retire more than $100,000 of the Suburban bonds in any one year it is to pay more than par for them.

Under the refinancing plan as now agreed upon reorganizers will pay off $4,100,000 of underlying bonds, $2,000,000 of Suburban bonds and $4,200,000 of receiver's certificates. The issue of $9,790,000 of St. Louis Transit Company bonds will be retired at the rate of $300 cash and 5½ shares of new preferred stock for each $1,000 bond, with the privilege of purchasing 10 shares of new common stock at $12.50 a share for each bond.

There will be 53,845 shares of preferred and 352,645 shares of common stock in the reorganized company. Holders of 163,830 shares of the present preferred stock may purchase 1½ shares of new common stock at $12.50 a share for each share of preferred now held. If all exercise this privilege this will bring $4,438,000 cash to the new company.

Such common stock as is not taken by the Transit Company bondholders or preferred stockholders may be purchased by the holders of the present common stock, of which the North American Company owns approximately 72 per cent.

Under this plan the bonded indebtedness of the company would be reduced to $34,800,000, but a new issue of $8,000,000 will bring it to $42,800,000. The company will ask the Missouri Public Service Commission for the privilege of earning 7 per cent on a valuation of $57,200,000 already fixed by that commission.

Four-Mile Line in New York Bankrupt

The Port Jervis Traction Company, operating between Port Jervis and the town of Deerpark, Orange County, N. Y., filed a voluntary petition in bankruptcy on Nov. 17 in the United States District Court. It was stated on behalf of the railway that the indebtedness was $165,419 and the assets $19,033.

Judge Henry W. Goddard appointed Harry T. Crist, Port Jervis, receiver under a $3,000 bond. The company also asked that its bus business be adjudged bankrupt, stating its liabilities amounted to $8,824 and its assets to $4,045.

According to its petition, the company operates on its surface car route 3.985 miles in a community of 10,171 people. Samuel M. Cuddeback, attorney for the company, recorded as one of its big items of indebtedness $70,000 of 5 per cent first mortgage bonds, held by the Orange County Public Service Company, Inc., Middletown, N. Y., with interest unpaid up to Oct. 1 of the current year, amounting to $27,527.

Other items listed as debts include State taxes of $213; taxes to the city of Port Jervis for 1921, $398, and for the current year, $374; county taxes, $3,224, and the Bank of Port Jervis, with an unsecured claim of $8,000.

Some of the assets are real estate, $10,000; receivable accounts, $3,208; vehicles, $5,100, and deposits of $725. Secured claims amount to $97,527 and unsecured claims $62,984.

October Operations in Toledo Show Deficit

While showing a slight improvement over September, operations of the Community Traction Company, Toledo, Ohio, during October this year proved to be far under the similar month a year ago. Commissioner E. L. Graumlich reported a net loss of $27,268, bringing the total deficit to the stabilizing fund to $550,753, including the original $400,000 in the fund. Actual operating expenses were met in October and about half the bond interest and dividends on preferred stock earned.

Increase in passenger revenue over September was $24,373. Operating charges for the month totaled $224,722, including $15,000 set aside for extraordinary maintenance. Last year the operating expense in October was $251,883.

During October 3,831,612 revenue passengers were carried compared with 5,178,069 for October a year ago. September this year showed only 114,383 revenue passengers a day were carried.

Business has continued to pick up for the first half of November with an increase in revenue of $4,500 as compared with a similar period of last month.

Successful Year in 1923

Capital Traction Closes Unusually Active Year with Substantial Increase in Balance

The credit balance of the Capital Traction Company, Washington, D. C., at the close of 1923 was $1,524,240, an increase of $169,673 over the credit balance at the end of the preceding year. More than ordinary activities during 1923 included the taking over of the Kensington Railway, the extension of tracks over the Key Bridge, the installation of bus lines and the large amount of work done on repair, maintenance and construction.

The report states that the increased use of automobiles in and about Washington is still affecting the railway. The average daily number of passengers carried during 1923 was 188,090, which represented a loss of 3.15 per cent over the preceding year. The loss in traffic resulted in a corresponding reduction in revenue. Operating expenses decreased $39,025 despite the fact that much money was utilized in the installation of bus service.

In February, 1923, bus service was substituted for operation on Con-

SUMMARY OF OPERATIONS OF CAPITAL TRACTION COMPANY YEAR ENDED DEC. 31

		1923	1922
Passenger revenue, railway...		$4,797,909	$4,966,341
Bus revenue....................		21,411	....
Special car revenue..........		106	20
Total revenue from transportation.................		4,819,426	4,966,361
Revenue from operation other than transportation........		23,192	27,682

*Exclusive of policemen and firemen riding free while in uniform.

necticut Avenue, on May 17 a bus line was established at Fourteenth and Kennedy Streets and on Aug. 1 the operation of a bus line from Eleventh Street was put under way. Again on Dec. 1 a bus line was established from Seventeenth Street and Pennsylvania Avenue. Eight buses were purchased at a total cost of $56,876. On the subject of bus operation the company states that the operation of these lines must, for the time being at least, result in some loss financially, but the company believes it is essential to establish the policy that all urban transportation should be furnished by the existing street railway companies wherever the need for it is positively shown. The additional transportation can be furnished much cheaper, for the present at least, by buses than electric lines on account of the high cost of conduit track construction.

FUNDED DEBT UNCHANGED

There has been no change in the company's funded debt. Of the total authorized issue of $6,000,000 first mortgage 5 per cent bonds maturing in 1947, $200,000 are held in the treasury and $194,000 have been repurchased and are held in the fire insurance reserve. Capital expenditures for the year amounted to $392,380. No change has been made in the method of accruing depreciation for several years past. The total amount accrued was $424,060. Charges against the reserve were $178,245, leaving a net accrual of $245,815. The balance in reserve on Dec. 31 was $1,665,474, of which $806,000 was invested in United States securities, $48,571 deposited in interest-bearing accounts and $810,902 advanced for capital expenditures. Tax accruals for 1923 were $439,031.

The three-year contract covering wages and working conditions which expired on March 30 was renewed for another three-year period through direct negotiations without the necessity of arbitration. In the history of the Employees' Relief Association, the year 1923 was the most prosperous. After charging off expenditures for sick and death benefits and all other expenditures the year's operation showed a net profit.

The accompanying tables show the year's operation *in toto* and per car-mile and some passenger statistics.

Terms of Holyoke Power House Sale Announced

The stockholders of the Holyoke Street Railway, Holyoke, Mass., meeting there on Nov. 18, ratified the action of the board of directors of the company in arranging for the sale of the railway power plant to the Turners Falls Power Company.

By the terms of the agreement the railway will receive $400,000 for the plant, but will agree to take power from the power company for a period beginning Jan. 1, 1926, and extending to Dec. 31, 1945. It is agreed, however, that the power company can begin to furnish power to the railway prior to the date mentioned if equipped to furnish such service. The power company has already made connections with railway lines at various points, except in Holyoke.

At the base rate of 0.018 cent per kilowatt-hour the minimum payment by the railway for power would be $117,000.

Jitney Competition Hurtful in Atlanta

For the fourth consecutive month the receipts of the railway department of the Georgia Railway & Power Company, Atlanta, Ga., have shown heavy losses as compared with the figures for 1923, the loss for October amounting to $41,269. This is the largest decrease in revenues of any month this year with the exception of September, which showed a loss of $47,000.

With $38,779 for July on the wrong side of the ledger and $35,904 for August, revenues of the railway department for the past four months are now $162,954 under those for the similar period in 1923.

It will be recalled that the railway failed by more than $565,000 in 1922 and by more than $589,000 in 1923 to earn the amount set by the State Public Service Commission as a fair return on the commission's minimum valuation of the property. This year it will fail by a much greater amount to yield a fair return.

In view of these conditions the company has again called attention to the petition before the City Council asking that steps be taken to put the railway on a self-sustaining basis. The company says that the figures for the past four months should be convincing proof of the statements contained in the petition and made by officials at the public hearings last January that unless relief is given it will be impossible to continue the railway service. The losses are considered to be due largely to unfair jitney competition.

Date of Conspectus Announced.—The Conspectus of Indexes prepared by Albert S. Richey will be published in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 29.

Railway Buys Bus Line.—The Jamestown-Dunkirk Transit Company, which operates several buses between Jamestown and Dunkirk, has been sold to the Buffalo & Erie Railway, Buffalo, N. Y., according to advices of George MacLeod, general manager of the transit company. It is planned to operate the bus line in conjunction with the railway company.

Service Discontinued.—Service on the South Side loop of the Jamestown Street Railway, Jamestown, N. Y., has been discontinued. The territory is now served by a bus line, except during the rush hour, when the trolley cars will run. The South Side trolley line was built many years ago and is one of the lines on which horse cars were first used. The line was electrified about 1890.

Passenger Revenue Increases.—For the ten-month period ended Oct. 31, 1924, the Philadelphia Rapid Transit Company, Philadelphia, Pa., had a net income of $1,709,590 against $1,705,163 for a similar ten-month period ended Oct. 31, last year. The number of passengers carried showed a falling off, being 755,724,687 in 1924 and 758,262,226 in 1923. The passenger revenue, however, increased. It was $36,494,359 for the ten months of 1923 and $36,659,484 for the period of January through October, 1924.

Makes Offer to Sell Toronto Line.—The York Township Council has received an offer from Sir Henry Thornton, head of the Canadian National Railway, to sell on behalf of that system the section of the Toronto Suburban Railway lying between the city limits and Weston. The price is given as $15,000. Sir Henry's suggestion also included bettering transportation conditions in the district. Prices mentioned were $25,000 for the portion of the radial within the Weston town limits and $15,000 for the southern end running through Mount Dennis into the township. A point in the offer was that the municipalities were not obliged to take over any of the present rolling stock of the radial line. It was stated that the Toronto Transportation Commission was willing to assume operation of the line provided satisfactory financial arrangements were made.

Net Income Increases.—For the four-month period ended Oct. 31, 1924, the Brooklyn-Manhattan Transit Company, Brooklyn, N. Y., and its affiliated companies had a total operating revenue of $14,360,028 against $13,020,657 for a similar period of last year. The expenses showed an increase from $8,645,726 for the four-month period ended Oct. 31 of last year to $9,424,390 for the four months of the current year. The net income advanced from $1,184,168 for the four-month period ended Oct. 31, 1923, to $1,681,863 for the similar four months of the current year.

Operating Ratio 75 per Cent.—The report of the Madison Railways, Madison, Wis., for the year up to Aug. 31, shows total revenues at $411,679, while operating expenses, not including interest or depreciation charges, were $311,352, or a little more than 75 per cent of the total amount taken in. The number of revenue passengers carried during the year decreased 190,000 over the two preceding years. These facts were contained in a recent audit made by the Railroad Commission. The company some weeks ago announced a comprehensive program of replacements and extensions to its system.

Deficit Increased.—For the nine-month period ended Sept. 30, 1924, the International Railway, Buffalo, N. Y., reported an operating income of $7,741,174 against $8,065,828 for the similar nine months in 1921. The operation and taxes showed a falling off, being $7,062,555 in 1921 and $7,043,486 in 1924. The gross income fell off from $1,033,769 in 1921 to $736,435 in 1924. After the consideration of income deductions the nine-month period of 1924 showed a deficit of $353,963 against a deficit in 1921 of $91,209. The company states that because of the strike in 1922 and its effect on the revenue and operating costs of the year 1923 the calendar year 1921 is used for comparative purposes.

Holdings Transferred. — The stockholdings of the Barnsdall Corporation of New York, which controlled the Moncton Tramways, Electric & Gas Company, Moncton, N. B., Canada, have been transferred to the Stevens & Wood interests of New York. Reference to the Canadian undertaking changing hands was made in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 4, 1924. About 2.5 miles of electric railway in Moncton are involved. The Barnsdall Corporation disposed of its interests for approximately $500,000. This stock was carried on the company's balance sheet at $105,780.

Changes Hands. — The Wellsburg, Bethany & Washington Railway, Wellsburg, W. Va., has recently changed hands and plans have already been laid by the new owners, the Buffalo Valley Collieries Company, to extend the line to Washington, Pa. For many years there has been discussion about this extension. The leasing of the line was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Aug. 23, 1924.

New Manhattan Railway Directors.—At the annual meeting of stockholders of the Manhattan Railway, New York, on Nov. 12, James F. Hughes, William Dean Embree and John Nordhouse were elected to fill vacancies on the board of directors. The Manhattan Railway owns 140 miles of elevated railway leased by the Interborough Rapid Transit Company.

Personal Items

A. J. Manson Advanced

Well-Known Westinghouse Official Is Made Manager of Company's Heavy Traction Division

A. J. Manson, manager of the transportation division of the New York office of the Westinghouse Electric & Manufacturing Company for the past four years, has been promoted to manager of the heavy traction division of the railway department with headquarters at East Pittsburgh.

Mr. Manson is considered one of America's foremost authorities on railroad electrification. He joined the Westinghuose company through its engineering apprenticeship course about nineteen years ago. Just before that he was graduated as an electrical engineer from the Massachusetts Institute of Technology.

©Underwood & Underwood

A. J. Manson

His long service with the Westinghouse company has included every branch, from construction to sales. As a result Mr. Manson has been connected with the work of solving nearly all of the important electric transportation problems in the eastern part of the United States. They include helping to build and test the first New Haven locomotive; being assigned to the electrification work of the New York, New Haven & Hartford Railroad in the spring of 1907 and aiding in the inauguration of electric service; instructing steam engineers in their duties as electric enginemen, and qualifying the early ones for electric service, and being associated with the preliminary test conducted by the Pennsylvania Railroad on Long Island prior to the decision as to the system to be used in the Pennsylvania tunnels entering New York City.

Another accomplishment of Mr. Manson was assisting F. H. Shepard, director of heavy traction of the Westinghouse company, in connection with the Pennsylvania-New York tunnel electrification. This installation included power house, substations and locomotives. Mr. Manson is well known throughout the electrical and railway world through his book "Railroad Electrification."

R. L. Peterman in Charge of Spartanburg Property

R. L. Peterman has assumed charge of the local utilities at Spartanburg, S. C., recently bought up by W. S. Barstow & Company. Mr. Peterman entered the utility field at Charleston, in the electric light division of the utilities company. He later went to Binghamton, N. Y., with the Binghamton Light, Heat & Power Company, another Barstow property, as general manager, succeeding Robert N. Hodgson. At one time Mr. Peterman was superintendent of the Pennsylvania Utilities Company.

As vice-president and general manager of the South Carolina Gas & Electric Company in Spartanburg Mr. Peterman has the problem of restoring railway service, which has been abandoned on practically all lines for the past few years. One of his first steps on assuming charge of the Spartanburg property was to petition the City Council for permission to operate bus lines in conjunction with the railway lines. In addition to his duties in Spartanburg Mr. Peterman also has charge of the Columbia Railway, Gas & Electric Company, another recently purchased Barstow property.

G. E. Emmons Retires from General Electric

George E. Emmons has asked to be relieved of his duties as vice-president of the General Electric Company in charge of manufacturing. Mr. Emmons is a pioneer in the electrical industry. He has been actively engaged in the management and development of the production department of the General Electric for nearly thirty years. During his administration the Schenectady plant attained its present immense proportions, and he has also been instrumental in the development of the company's plants in other places. He began his electrical work with the old Thomson-Houston Company in 1886. When that organization was merged with the General Electric Company he was retained on the staff.

In 1895 he was made general manager of the plant at Schenectady and in 1916 was elected to the office of vice-president. Two years ago Mr. Emmons was decorated by the Japanese government in recognition of his services in introducing electrical machinery into Japan and of his contributions to the development of the electrical industry in that country.

In commenting on his resignation Gerard Swope, president of the company, said:

> Mr. Emmons has served the company loyally, whole-heartedly and indefatigably

for almost forty years. He has met his arduous responsibilities not only with outstanding ability, but in a manner which has won and held the respect and affection of workers in all grades of service throughout the organization.

Willis A. Lovejoy New Superintendent of Maine Property

Willis A. Lovejoy has succeeded Sterling T. Dow as superintendent of the York Utilities Company, operating between Sanford and Biddeford and from Town House to Kennebunkport and Cape Porpoise, Me. Mr. Dow, whose resignation was referred to recently in the ELECTRIC RAILWAY JOURNAL, has accepted a similar position in Portland. His successor was elected at a meeting of the board of directors on Oct. 29, but the promotion did not become effective until Nov. 1. Mr. Lovejoy has been associated with the Maine property, formerly the Atlantic Shore Line, for twelve years. He was first employed as shop foreman at Dover, N. H., when the Dover and Portsmouth branch was in operation, and later as master mechanic at Town House. Mr. Lovejoy originally went to the Atlantic Shore Line from Lewiston, where he was in charge of the carhouse of the old Lewiston, Brunswick & Bath Railroad.

George Hanscomb, for many years connected with the York Utilities Company, both in the operating and executive departments, was chosen assistant superintendent.

E. L. McCulloch, who was assistant to C. D. S. Johnson, president of the old Denver & Laramie Railroad and the Seeing Denver Electric Railway Company, and who piloted the canvass of Rice Means until he was elected United States Senator in the November election, has been appointed secretary to Colonel Means. Mr. McCulloch is a former newspaper man.

Carl Bacon, for the past four years chief electrical engineer of the Olean, Bradford & Salamanca Railway, with headquarters at Olean, N. Y., has resigned. He will become connected with the Texas Company, New York.

H. G. Butler would seem to be nearing the end of his duties as state power supervisor in California. The emergency during which he has been serving has about passed. With the impending finish of the necessity for power saving, much praise is to be extended for the qualities of firmness, tact, consideration and quiet efficiency shown by Mr. Butler. The State Railroad Commission had full jurisdiction over the power-saving campaign, and that body selected him for the position of state power supervisor principally due to the skill he displayed in similar executive work during war-time conservation. In the work now drawing to a close Mr. Butler has, more or less, occupied a buffer position between the public utilities, including the electric railways, and consumers, and he has performed the near miracle of apparently satisfying all parties and bringing about civic teamwork. Under a less competent hand, confusion might easily have resulted. Mr. Butler is a consulting engineer in private practice in San Francisco.

Mr. Butler Named Senator

Electric Railway President Appointed by Governor to Succeed the Late Mr. Lodge of Massachusetts

William M. Butler, president of the Boston & Worcester Street Railway, Framingham, Mass., and the Boston & Worcester Electric Companies, was appointed on Nov. 13 by Governor Cox of Massachusetts to fill until the next general State election in 1926 the seat in the United States Senate left vacant by the death of Henry Cabot Lodge. Mr. Butler led Calvin Coolidge's pre-convention campaign for the Presidential nomination and was chairman of the Republican national committee in the recent election. He will continue in that capacity.

From the eighth floor suite of offices at 77 Franklin Street, Boston, Mr. Butler has long kept a watchful eye on the operations of his several textile properties, an electric railway and the political horizon. Visitors concerned with one or another of these fields of activity come and go in a constant stream. Like the late Senator Crane and like the silent man of the White House, Mr. Butler is a doer rather than a talker. By his own efforts he has made a fortune in the textile industry, controlling some of the best properties in New England, and has found time to take an effective part in politics, state and national. for many years. He has a vigorous physique, is alert of mind and is endowed with charm of personality.

A year ago, before Mr. Butler threw himself into the Coolidge campaign, it was said of him that politics was his hobby, his recreation. It was said that he loved the game, but that he was merely a fan. However, he proved himself to be an adept at the game when he took it upon himself to participate as a player.

Mr. Butler is a minister's son. His father, James D. Butler, was formerly a sea captain of New Bedford, and later was ordained a clergyman in the Methodist Episcopal Church. His mother was Eliza B. Place. William was born in New Bedford on Jan. 29, 1861. He received his education there, and before deciding to make law his life profession, worked as a bookkeeper. Then he attended Boston University, graduating with his law degree in 1884, and setting up an office in New Bedford. He got his first taste of politics by being elected to the New Bedford City Council and to the State Legislature. But he was Councilman, Representative, Senator, and then he quit being a candidate for office and became a manager. It was then that Senator Crane took charge of his destiny.

Mr. Butler moved to Boston and his law practice expanded. He acquired interests in various business concerns, chiefly textile interests and the Boston & Worcester Street Railway. He kept in touch with legislation and took up politics as his hobby. When Crane was in Washington Mr. Butler was his spokesman in Massachusetts.

Besides being president of the Boston & Worcester Street Railway, Mr. Butler is head of the Butler Mill, Hoosac Cotton Mills, New Bedford Cotton Mills Corporation, and Quissett Mill. He has been a trustee of Boston University and a member of a half dozen exclusive clubs.

In urging the appointment of Mr. Butler to public office the Boston *News Bureau* paid him this fine compliment:

> Nobody is better equipped, nobody has shown higher talent, to uphold the Coolidge program than William M. Butler. He may not want the task. Private business is calling for his attention, as it is calling for the attention of many valuable members of the Cabinet. But is it not a duty for them all to sacrifice still further personal considerations and plant the United States solidly on world reconstruction with reduction of government interference and reduction of taxation?
>
> Is not one of the keynotes of this situation the appointment of William M. Butler by Mr. Cox to uphold the hands of the administration and the policies of President Coolidge? And is it not the duty of Mr. Butler to accept?

Obituary

Martin F. Delahanty died suddenly on Oct. 23 at his home in Buffalo, following a stroke the day before. He had been connected with the International Railway, Buffalo, for 27 years in various capacities. At the time of his death Mr. Delahanty was foreman of the electrical department.

E. A. Gregory, district sales manager of the American Brake Shoe & Foundry Company, New York, with headquarters and residence at Houston, Tex., died on Nov. 1 in New York, following a severe illness and operation. Mr. Gregory was a most lovable character and a general favorite with a large number of friends, acquaintances and railroad officials, particularly in territory comprising the States of Louisiana, Mississippi, Texas, Arkansas and Oklahoma. He was born in Nashville, Tenn., on March 22, 1877, and took up railroad work in 1900 with the Nashville, Chattanooga & St. Louis Railway. In 1903 he was appointed foreman of terminals of the Louisville & Nashville Railway at Nashville, Tenn., which position he held until he entered the employ of the American Brake Shoe & Foundry Company on Jan. 15, 1909. On March 1, 1923, he was appointed district manager of the company, with headquarters at Houston.

Frederick Alfred Boutelle, a pioneer in the electric railway industry, died on Nov. 4 at the home of his daughter in Portland, Me. He was identified with transportation companies on the Atlantic coast, the Pacific coast and in the central states for more than 45 years. At the age of 18 years, he entered the employ of the Delaware & Hudson Canal Company in the capacity of telegrapher. Some years later he was promoted to chief dispatcher. He continued in this position until 1901, when he resigned to become general superintendent of the Hudson Valley Electric Railway, Glens Falls, N. Y. In 1902 he became superintendent of transportation of the Columbus, Buckeye Lake & Newark Traction Company and the Columbus, Newark & Zanesville Electric Railway. In 1905 he resigned this position to become general superintendent of the Tacoma Railway & Power Company and the Puget Sound Electric Railway at Tacoma, Wash. He held this position until he retired in 1913. Mr. Boutelle was 73 years old.

for Discussion of Manufacturing and Sales Matters

Electrification Progressing in Europe

Roads Are Planning to Handle Greater Traffic and Already Have in Use Over 3,000,000 Hp. of Locomotives

Marked activity in electrification all over Continental Europe was observed by Frank H. Shepard, director of heavy traction of the Westinghouse Electric & Manufacturing Company, who returned to New York last week after a month's trip to France, Italy, Spain, Switzerland, Czechoslovakia, Germany, Holland and England. In an interview with representatives of this paper he said that the work of electrification on the Continent is in full swing. Plans are being made for the future, so that the railroads can handle greatly increased traffic.

Installations in progress or already in operation on the railways in Norway, Sweden, Germany, Austria, Switzerland and Italy, using alternating-current trolley systems, single-phase or three-phase, now have in use or on order locomotives totaling some 2,500,000 hp. In France, England, Spain and Holland, where the direct-current systems are used, some 600,000 hp. of locomotives are built or building.

While in the past American manufacturers have supplied considerable electrification material for European roads, Mr. Shepard is of the opinion that in future the nationalist movements in the leading European countries will result in the production locally of more and more of their equipment. This movement has even gone so far as to affect the decision for electrification systems, particularly in France, where direct current was adopted in part to prevent interchangeability with Germany, which uses the single-phase system.

AMERICAN EXPERIENCE STILL NEEDED

Mr. Shepard felt that despite the movement for patronizing home industries, American engineering experience and the leading position of this country in the electrical industry will make the assistance of our manufacturers essential, so that they may expect to participate in European electrification work for a long time to come. Of course, he said, we must bear in mind that foreign countries have gone much further than America in electrification work, having three to four times as many miles operated in this manner, although the United States has over half the world's railroad mileage.

What is needed here, he said, is that the railroads get away from the present plan of going along day by day, which has come as a result of over-regulation and adverse legislation, and adopt a broad policy looking toward the future. Greater stability in the political situation should bring this nearer than it has been. Electrification should then be considered not as a means of replacing steam but of giving a service impossible with present operating methods.

$8,250,000 for New Equipment

The Illinois Central Railroad on Nov. 19 awarded contracts for $8,250,000 of new equipment. This includes 130 motor cars to be built by the Pullman Car & Manufacturing Company and 85 trailers by the Standard Steel Car Company. The contract for the entire electric control equipment was awarded to the General Electric Company. The motor order was divided between the General Electric Company and the Westinghouse Electric & Manufacturing Company, each company to furnish 50 per cent. Deliveries of cars and electric equipment shall start March 1, 1926, and shall be completed by July 1, 1926. Except for the electric equipment these cars will be similar to the 45 purchased during the last three years, which are now hauled by steam engines. The motor cars will carry pantographs and will be arranged for multiple-unit control from either motor or trail car.

Brooklyn Car Order Placed

Final decision has been reached by the Brooklyn City Railroad, Brooklyn, N. Y., concerning the placing of its order for 335 double-truck four-motor cars. Of these 150 will be built by the J. G. Brill Company, the trucks being built by Brill; 100 by the St. Louis Car Company and 85 by the Osgood-Bradley Car Company. Motors for the entire complement will be supplied by the Westinghouse Electric & Manufacturing Company. Westinghouse Air Brake Company will furnish the air brakes. Some details of the other equipment of the cars remain to be settled and announcement concerning them probably will be made in the near future.

Metal, Coal and Material Prices

Metals—New York	Nov. 18, 1924
Copper, electrolytic, cents per lb	13.938
Copper wire base, cents per lb	16.25
Lead, cents per lb	8.65
Zinc, cents per lb	7.25
Tin, Straits, cents per lb	54.75
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.325
Somerset mine run, Boston, net tons	2.05
Pittsburgh mine run, Pittsburgh, net tons	1.875
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	1.275

Linseed oil (5-lb. lots), N. Y., per gal	$1.13
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.152
Turpentine (bbl. lots), N. Y., per gal	0.85

Local Firm Favored for Detroit Bus Bid

Following a hearing on Nov. 14 before the Detroit City Council in committee, it was decided to award a contract for 50 double-deck buses for the Department of Street Railways to the Standard Motor Truck Company, a local concern. The Street Railway Commission had previously recommended that the bid of the Yellow Coach Company, Chicago, be accepted, although that concern's bid was $11,250 a bus and the Standard Company's bid was $9,500. Final action has not yet been taken. Even after the contract is awarded the Council can reconsider its action any time within several days.

Ross Schram, general manager, suggested that if it was desired to encourage the bus building industry in Detroit, the Council should reject the bids now under consideration and re-advertise so as to purchase 25 buses of known quality from the Chicago firm and distribute contracts for 25 among the Detroit manufacturers. He suggested that the commission be permitted to provide new specifications.

It was pointed out by the commission that Yellow Coach buses were wanted by the Street Railway Department in extending its transportation service because those buses met all the requirements specified by D.S.R. engineers and were manufactured by a concern which has put out hundreds of buses similar to those desired for use in Detroit, while the Standard company has made only single-deck buses.

Mr. Schram also questioned the assumption that the Standard's bid was the lowest. He cited that the bid was on a type of bus that differed in five or six important details from that of the other company.

A tentative agreement has been reached by the D.S.R. under which the department may rent single-deck buses from Dodge Brothers, Inc., for suburban use with the understanding that the rental paid may be applied on the ultimate purchase price if the city decides to buy the buses. The D.S.R. has been given authority to advertise for open bids on such a rental project.

Glasgow Corporation Rejects American Bid

The Glasgow Corporation turned down on Nov. 13 the recommendation of the tramway committee to place a contract for special trackwork with the United States Steel Products Company. Its offer was £7,850, or £800 less than the lowest British offer, which the corporation decided to accept. The vote of the corporation was 73 against acceptance to 17 in favor.

In making his motion that the work be given to the lowest British bidder, Counselor Walker said that the American company refused to recognize the elementary right of workmen of combining to protect their interests and that the Americans were throwing their goods in England at lower prices than they charged in the home market so as to destroy any revival of trade in Britain.

Car Order Delayed

Grand Rapids Railway Intends to Conduct Test of Vehicles Supplied by Three Manufacturers

Louis J. DeLamarter, vice-president and general manager of the Grand Rapids Railway, has announced he has secured the co-operation of three of the leading car builders in the country for a comprehensive test on the lines of his company of three types of street car which will embody the latest ideas in car construction.

Cars will be entered in the competition by the Light Weight Noiseless Electric Street Car Company, Minneapolis; the St. Louis Car Company, St. Louis, Mo., and the J. G. Brill Company, Philadelphia. These cars are to be light-weight, double-truck, single-end type, arranged for both one-man and two-man operation. Definite details of the cars in the contest have not been settled. It is expected the cars will be delivered to the railway about Feb. 1, 1925. They will be operated through the winter, given the severest tests possible and a decision reached in the early spring by the railway with respect to the award of a large order for new cars.

The average weight of the cars to be replaced is about 47,000 lb. The new cars will weigh about 24,000 lb., but will have the same seating capacity as the cars it is intended they shall replace. They will be 36 ft. 8 in. long, equipped with double folding front and rear doors. The roof will be of the plain arched type and will be made of Haskelite. The interiors will be finished in mahogany.

One or more of the cars will be equipped with Mead cushion wheels, a new departure in street car construction. This wheel has a steel tire with rubber core, designed to eliminate any shock. Another feature is to be a brake band which will operate on large brake drums attached directly to the axles, the same as on automobiles. In order to install the band brake it has been necessary to redesign the truck to make it inside hung and not outside as at present. An adjustment device is to be so arranged that any slack in the brakes may be quickly taken up from time to time. One of the cars doubtless will be equipped with hydraulic brakes. Four 25-hp. motors will be installed on each car.

There are to be emergency door openings at the rear, but the operator will be prevented from starting the car until the emergency door has been closed. The cars are also to be equipped with an outside control valve to permit a street man to open the rear door from the outside, collect fares, let passengers on and otherwise speed up car loading. In addition to the air brake the cars will be equipped with a Peacock staffless hand brake for emergency use.

The windows will be made to be raised instead of being lowered into a slot. Footrests are to be designed for just the proper height and reach for restful posture. The seats will be extra wide. The seats and backs will be spring filled and made of rattan. One of the cars will have plain floors and another will have mosaic rubber tiling. Electric heaters will be used. There will also be a new and improved design of wheel guard and fender.

Air-operated track scrapers will facilitate the work of keeping the right-of-way open after heavy snowfalls. The latest approved safety car electric lighting fixtures will adorn the new cars. For the local service it was considered advisable to adopt the folding step to which the riding public is accustomed. Large illuminated destination and routing signs will be used, the destination sign on the upper part of the vestibule, the route sign on the dash. All the car trimmings will be in bronze, polished and lacquered.

A new feature of at least one of the cars will be the observation end. The rear vestibule will be provided with seats all around, giving an unobstructed view of both sides of the street.

During the test period the cars will be painted different colors to distinguish them and make it easy for the public to give each a trial.

Rolling Stock

Indiana Service Corporation, Fort Wayne, Ind., is in the market for the purchase of 15 new light-weight interurban cars.

Detroit United Railway, Detroit, Mich., has placed an order with the G. C. Kuhlman Car Company for the construction of 10 new light-weight interurban cars which will be similar in design to the last group of cars built by the Kuhlman company for the Detroit United.

Portsmouth Public Service Company, Portsmouth, Ohio, is changing over six light-weight double-truck cars for one-man operation. These cars will be equipped with Safety Car Devices Company equipment and will have the exit at the rear. They will be similar to the three new cars now being built for this company by the Cincinnati Car Company.

Track and Line

Community Traction Company, Toledo, Ohio, is doing temporary repair work on Cherry and Summit Streets. It is planned to renew the track next summer.

South Carolina Gas & Electric Company, Spartanburg, S. C., is repairing street paving between its tracks on East Main Street and Morgan Square. Tracks are being reconditioned and new copper bonds to hold the rail sections are being put in place. This work is preparatory to resumption of railway operation by the new management.

Key System Transit Company, Oakland, Cal., has opened the new extension of the Piedmont electric train line into Piedmont, to serve that city and give through service to San Francisco. The extension into Piedmont runs from the old terminal at Piedmont Avenue and Fortieth Street over the present street car tracks to Manor station, and then over a new right-of-way and new tracks to Oakland Avenue. The extension cost $65,000. The Key System company has also begun work on two other projects in its program of track replacement and extension. The first was started on West Twelfth Street between Wood and Market Streets, Oakland. This involves the reconstruction of the tracks and the laying of permanent pavements. The estimated cost is $103,000. The second project covers double tracking of the Lakeshore Avenue line on Walla Vista Avenue from the end of the present double trackage system at Lakeshore Avenue to a point about 1,700 ft. beyond.

Trade Notes

Armin Elmendorf, who during the war was in charge of the plywood section of the Forest Products laboratory at Madison, Wis., has rejoined the engineering staff of the Haskelite Manufacturing Corporation, Chicago, Ill. Mr. Elmendorf has been in Europe for the past two years investigating the electric railway, bus and commercial body fields. During his stay there he collected a great deal of interesting data on car construction. Mr. Elmendorf reports that the one-piece Haskelite roof has proved satisfactory on the street cars of London and that at the present time there are more than 2,000 buses on the streets of London using Haskelite.

T. R. Langan, manager of the transportation division of the Westinghouse Electric & Manufacturing Company at Buffalo, N. Y., will succeed A. J. Manson as manager of the transportation division of the New York office of the Westinghouse Electric & Manufacturing Company. As noted elsewhere in this issue Mr. Manson has been made manager of the heavy traction division of the company with offices in Pittsburgh.

Howard J. Whittman, Toledo, Ohio, has been appointed district representative of the Kuhlman Electric Company of Bay City, Mich. Mr. Whittman will have northwestern Ohio as his territory.

Westinghouse Air Brake Company, Wilmerding, Pa., automotive division, has announced the opening of a new automotive air brake sales and service branch at Detroit in the General Motors Building, with C. D. LeFevre in charge. Mr. LeFevre is well known in the automotive industry, having served for several years as assistant secretary of the Society of Automotive Engineers. A little more than two years ago he became Eastern manager of manufacturers' sales for the Westinghouse Union Battery Company and was later made special factory representative. He was graduated from Cornell as a mechanical engineer in 1911.

New Advertising Literature

J. G. Brill Company, Philadelphia, Pa., has issued Bulletin No. 280, describing its 27-M. C. B. truck.

Crouse-Hinds Company, Syracuse, N. Y., has issued folder No. 20, entitled Safety Switch Condulets (tumbler type).

Separate Accounts Desirable for Combined Utilities

A TENDENCY has been in evidence in some quarters for railway men to rejoice in the fact that their particular companies were financially associated with and under the same general management as electric light and power companies. The reason for taking satisfaction in this arrangement was the idea that the electric light company would probably make a big profit and could make good whatever losses the railway might incur. A safeguard of this kind may have merit in the eyes of those engaged in marketing the railway securities. It is generally admitted, however, that such a combination, where the profitable department carries the unprofitable one, is unsound as an economic proposition. Aside from that fact, there are also practical difficulties which are sometimes overlooked.

It is very difficult to imbue the employees of a railway associated with a lighting company with the idea that they must unceasingly try for efficient operation. Their attitude seems to be that the electric company will foot the bill and they need not worry. In numerous cases combined railway and electric companies are more careless and slipshod in their methods than are the railways which must depend exclusively on their own resources.

Where a combination of utilities exists under one management, best results come with separate books for the individual services. Not only is this advisable for executive purposes, but the individual figures are available for use in advising both the employees and the public of the earnings status of each utility.

Depreciation Is Real and Must Be Recognized

THE brief on the subject of depreciation submitted some time ago in behalf of the steam railroads in their case before the Interstate Commerce Commission shows a studied effort to prepare an argument to avoid setting up depreciation funds. This was made on purely legal grounds without giving sufficient weight to engineering facts. The argument is that the average American trunk line is so large and so diversified that any depreciation that may have accrued is balanced by new construction. In other words, they claim the net result is that there is no depreciation. This does not square with the position taken by the American Electric Railway Association that a reserve for depreciation should be set up.

As a matter of fact, depreciation is something that does exist. A locomotive that has seen service for 30 years cannot be as good as ever, regardless of the quality of repair work done on it. Maybe it will function well enough to haul trains, but it is not the machine that it was when purchased. No amount of repair, be it ever so good, will suffice to put it in that condition.

Then there is the question of adequacy. This is so closely bound up with depreciation that it is difficult to separate the two. There comes a time when it no longer pays to patch up the old machine, because there is available on the market something that will do the work so much better that it is folly to spend the money necessary to keep the old machine in working order. The old machine may be "in 100 per cent condition" today, as the steam road brief argues, but actually it is a 100 per cent machine as of 30 years ago.

It naturally is impossible to determine with mathematical accuracy the date on which a certain piece of apparatus will reach the point where it will fail to do the work and must be replaced. Any allowance to cover such reduction in value as will accrue from the action of time, wear and the elements must be made very roughly approximate. Certainly it is possible to show examples of equipment that, through careful repair, have been able to give service over a long period of years. On the other hand, other equipment will wear out very quickly, or will be involved in accidents which will shorten its life materially. To get at the proper accruals for depreciation is quite similar to the calculation of life insurance rates. The amount to be set aside for the individual element is taken from the average of a large number of such units. Enough information is available to enable an accountant to determine the proper accruals for depreciation of the average car, locomotive or piece of track.

On a large property the amount of new construction may offset the amount of depreciation, but unless the cost of the new work is charged to operation rather than to capital it does not cancel the depreciation.

What the "Automobile Guest" Does to the Electric Railway

THE New Orleans *Times Picayune*, in a recent issue, disagrees with an electric railway statement that automobile drivers are too generous when they invite neighbors to accompany them to and from town and thereby deprive the railway of customers. This newspaper declares that the host in this case would not extend such an invitation unless he expected to gain by it—the usual motive being companionship for the ride—and that it would be an economic waste for such an automobile owner to use a car suitable to carry five or more persons for the transportation of but one. Hence, both driver and guest benefit.

No one will deny that the automobile owner is within his rights when he invites his neighbor to ride with him. Unfortunately it is also a fact that an electric railway in a community cannot continue to give good service unless it receives sufficient patronage. Possibly the existence of such a line in their community is a matter of indifference to the automobile owner and guests in question. But the continuance of trolley service for the remainder of the community is of real concern to them. Without it they would find the business of their town, including their own, stagnated. Their servants and the tradesmen and workmen who serve them would not be able to reach their places of employment. The great bulk of the buyers would not be able to get back and forth to the stores. So it is true that even the man who provides his own transportation has good reason to avoid a practice which, if multiplied enough times in a community, will impair continuance of the public transportation system.

Another point raised in the editorial mentioned is the economic waste of operating a large automobile for the transportation of one person only. This point is well taken, but if the automobile owner accepts this view, there is hope he will soon realize that it is almost as much an economic waste to operate his automobile for the conveyance of two or three persons, and that in most circumstances he and his friends will save money (and often time) by riding in the trolley rather than in a private car. This has not always been the case in the past, but with more stringent parking regulations it will become more true in the future. The private automobile has its important place in the daily life of the American family, but usually its place is not that of a vehicle to take the owner to and from his daily work.

Pruning Off the Dead Branches Has Strengthened the Tree

BETWEEN 1917 and the end of 1923 service was suspended on more than 400 miles of electric railway track in Massachusetts, mostly in the eastern part of the state. Since the beginning of 1924 there have been additional, but less extensive, abandonments. No public transportation of any kind is furnished over some of the abandoned routes, but in most cases buses are now running where cars formerly were operated. The opinion is held among electric railway men in this territory, however, that the replacement of rail lines by bus lines has gone about as far as it is likely to go.

Suspension of service on these many miles of track was the natural outcome of an unduly optimistic program of railway building a generation ago. This fever ran even higher in Massachusetts than it did elsewhere. Instead of being content with the construction of one rail line between important points, promoters built two and three. As a result the service and traffic were divided. Other lines were built through such sparsely settled territories that they were never profitable. The advent of the passenger automobile which retarded the natural growth of railway traffic, and the era of high costs prevailing since the war, made the operation of these routes a heavy burden.

Now, however, most of the unprofitable lines which duplicated the service supplied on other routes, or which ran through "no man's land," have been lopped off. This pruning process has undoubtedly strengthened the railway systems, and the lines that remain are now on a sound basis. In the main, they are earning a fair return and it appears unlikely that any considerable additional mileage will be abandoned or replaced with buses in this state.

That is not to say, however, that bus transportation in this territory has reached the limit of its development. Buses are being used more and more on feeder and cross-route lines and to furnish express service. An example of the latter is the Boston and Lowell route operated by the Eastern Massachusetts Street Railway. The Boston & Worcester Street Railway is considering the establishment of a similar service between those cities. The Boston Elevated Railway is already operating a number of feeder bus lines and is considering others. In New Bedford the Union Street Railway operates buses through districts not served by its cars. Further developments of this kind may be expected, even though the railways continue to operate cars, on most of the present track.

The New Standard of Comparison Sets Requirements Higher for Public Vehicles

AT A RECENT sectional association convention a master mechanic described in detail how the operating and mechanical departments on his road co-operated so that the attention of maintenance men would be directed to rattling sash or squeaking bodies on the buses operated by the railway. He elaborated on the importance of eliminating such squeaks and rattles from the standpoint of pleasing the patrons of the line.

Now this master mechanic was undoubtedly right. He knew from experience what an annoyance a squeak or rattle in a private automobile produces. It was the sales value of quiet operation that stimulated the development of the passenger automobile from an extremely noisy vehicle to its present almost noiseless operation. This development took place in the face of severe inherent difficulties. The sales value of quietness, however, furnished the necessary stimulus to carry out the improvement in the face of the difficulties. The master mechanic appreciated the sales value of quietness in his buses because of their direct outgrowth from the automobile, because he and his passengers apply the standards of automobile comfort in judging the comfort of his buses.

But how many railway men are fully aware that railway passengers are also judging the comfort of a railway ride by automobile standards? No wonder we hear much these days of "the rubber urge" and "the desire to ride on rubber." That desire is largely a desire to ride quietly. Although operation on steel rails imbedded in concrete presents many complications from the standpoint of quiet operation, surely an application of the painstaking care described by this master mechanic in connection with the maintenance of buses would also produce improved conditions on railway cars. Tight sash and the elimination of body and truck squeaks and rattles would make the average electric railway car a more pleasant and desirable vehicle in which to ride.

It is entirely a matter of viewpoint. It is easy to appreciate the importance of quiet operation of a bus. The same sales value also attaches to the same factor in railway cars. Surely more careful attention to these squeaks and rattles would work a substantial improvement, pending further development of body and truck construction with a view toward quiet operation.

Buses Amplify Transportation in Decatur, Ill.

Unified Car-Bus System Gives Transportation Service to Illinois City of 45,000—Fifteen Modern Buses Supplement Street Cars with Free Transfer Privileges—Transfer House in Center of Business District Is Starting Point for All Cars and Buses

SINCE the inauguration of bus operation in Decatur on Aug. 1, 1924, by the Illinois Power & Light Corporation, this city of 45,000 population has had a unified and co-ordinated transportation system. All parts of the city are served at a single fare and free transfers are issued between cars and buses. For a short distance from the center of the city cars and buses operate over the same street, but the routes soon diverge. A number of the bus routes serve sections of the city not conveniently provided with railway facilities, while others supplement the service in districts already reached by the street cars.

The history of the transportation situation in Decatur is not unlike that of a number of other cities where the public has underestimated the value to it of the street railway and has allowed competition to run riot. Since 1920 independent bus operation has developed with great rapidity on a 5-cent fare, while the railway fare was 6 cents or 9 tickets for 50 cents. The city administration has endeavored to make political capital of the difference in fare. The buses prospered, and while they did not operate entirely on the same streets as the railway, the effect of the added transportation service was felt by the company.

After these conditions had continued for three years the railway undertook an extensive investigation of the entire transportation problem in Decatur. A consulting engineer was called in and he submitted a report to the management and to the City Council. Among the suggestions embodied in his report was one to the effect that the railway should operate buses as auxiliaries and feeders.

Following out this suggestion the railway procured from the Illinois Commerce Commission a certificate of convenience and necessity for operating buses. This was done with the definite understanding that the competitive lines would be purchased before operation was started. Negotiations between the railway and the independent bus operators resulted in the latter obtaining fair prices, considering the depreciated value of the equipment and an additional amount for good will. The railway management believes that legal action to end the competition would have been unpopular with the people of the city, as would have been the inauguration of competitive bus service.

The new equipment purchased consisted of 10 Model Z 29-passenger Yellow Coach Company's buses and 5 Mack 25-passenger buses. These vehicles represent an expenditure of $120,000. They are painted according to the company's standard color scheme of yellow and orange. The seal of the railway appears on the letterboard. In the interior no hand straps have been provided, although it is customary at times to carry standees. Fare collection is accomplished by means of a Woods farebox.

A number of the former independent operators have been taken into the employ of the railway. These men were carefully trained in the operation of the new equipment and with a few exceptions have proved satisfactory. The remaining bus drivers were secured from outside except two men who transferred from the car service. The uniform worn by the bus drivers is made of Oxford gray whipcord with breeches and leather leggings.

All bus and car routes start from the transfer house in the central square. This terminal serves as a hub for the co-ordinated transportation system and is a convenient place for transfer between bus and car. Six the transfer house. Loading points are designated by signs and the police department keeps this area free from parked automobiles.

Bus lines intersect the street car lines only in the center of the city and transfers are issued between the two only at the transfer house, as the bus routing is such that transfers at other points are not needed. All bus routes are comparatively short, the longest being that to Nelson Park, a distance of 2.72 miles. The present arrangement of bus and car routes is shown in the accompanying map. The total route mileage of the buses is 11.44. The base schedule calls for 10 buses and the running time is 10 m.p.h., as compared with a schedule speed of 8 m.p.h. under independent operation. All routes with the exception of the Nelson Park line operate over paved streets. This line is operated over a gravel road from the city limits to the park, but as the road is in fair condition, the buses experience no difficulty. Nelson Park is an attraction on Saturday evenings and Sundays. The base schedule, which is normally handled by one bus covering the route every 30 minutes, is augmented by five additional vehicles during the peak periods on Saturday afternoons and Sundays. Often a bus is called upon to carry as many as 65 passengers to or from the park. While such heavy traffic might be handled more economically by street cars, the overloading is of short duration, and the normal traffic during the week is handled easily by one 29-passenger bus.

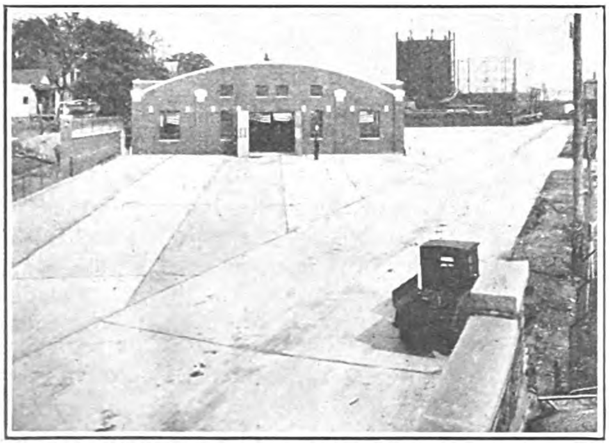
and running time are shown in the accompanying table.

The street car system consists of a total of 15.75 miles of route covered by 25 cars the majority of which are single-truck safety cars. Headways vary from 10 to 20 minutes. Most of the lines are single track with turnouts.

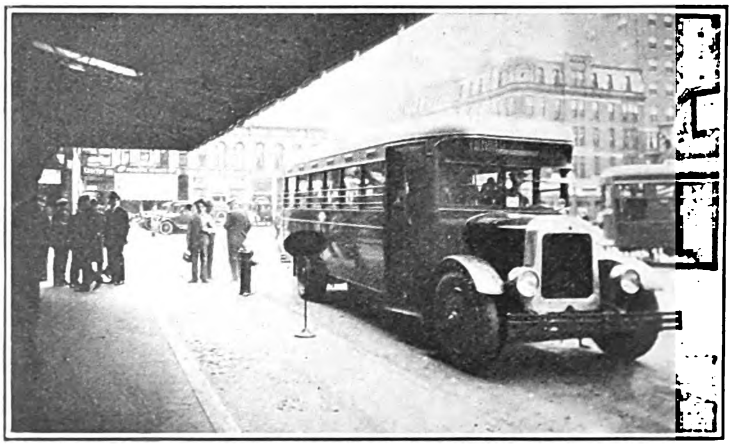
During the first month the buses operated by the railway carried an average of 9,000 passengers per day, a notable increase over the average number carried by the former independent operators. In the opinion of the management this increase was due to the more comfortable and attractive vehicles operated and to the co-ordinated service. At the same time the street cars also showed an increase in the number of passengers carried.

No.	Name	Round Trip Miles	Base Vehicles	Round Trip Time, Minutes	Scheduled Headway, Minutes
1	Franklin..........	2.23	1	15	15
2	East Main..........	2.42	2	20	10
3	Nelson Park.......	5.44	1	30	30
4	North Jasper......	3.73	2	24	12
5	North Monroe.....	4.62	2	30	15
6	West Decatur......	3.44	2	20	10

To give the new service a favorable start full-page advertisements announcing the plan were published in the local newspapers. Later advertisements were used to announce the actual beginning of bus operation and to familiarize the people with the routes and the rates of fare. While the present fare of 6 cents cash or 9 tickets for 50 cents is a slight increase over the



The Storage Space Outside the Garage Is Equal in Area to that Inside



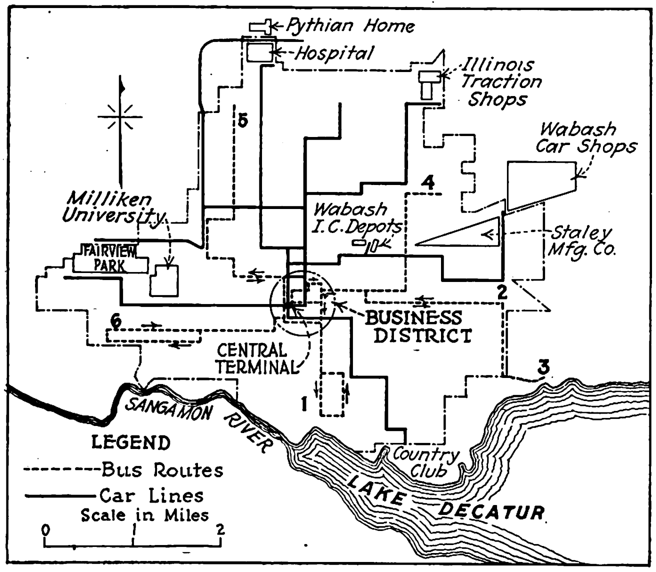
Loading Spaces Have Been Provided by the City at Various Points Along the Curb at the Central Square

5-cent fare formerly charged, no complaints have been received.

A new garage costing $60,000 was built for the buses on property adjacent to the railway carhouse. This building is 200 ft. long and 80 ft. wide and is so situated that entrance can be had through a door at the south end, while egress from the building is by nine double swinging doors on the east side. The garage has been located upon a triangular piece of property in such a way that it has been possible to pave the remainder of the land, thus affording a large amount of outside storage space. In order to make a convenient approach to the property, 300 ft. of street was paved and at the same time one-half of the width of the street on the east side of the property was paved to afford an exit. Property owners along this street paid for the paving for the other half.

Red brick with white limestone trimmings was used for the building. A single span arch roof is carried on steel trusses spaced at 20-ft. centers. The curve of the roof has been carried out in the construction of the end wall, giving the building a pleasing appearance. The east wall consists of the nine double doors already mentioned. On the west, 60 per cent of the wall space is taken by windows with small panes set in steel frames.

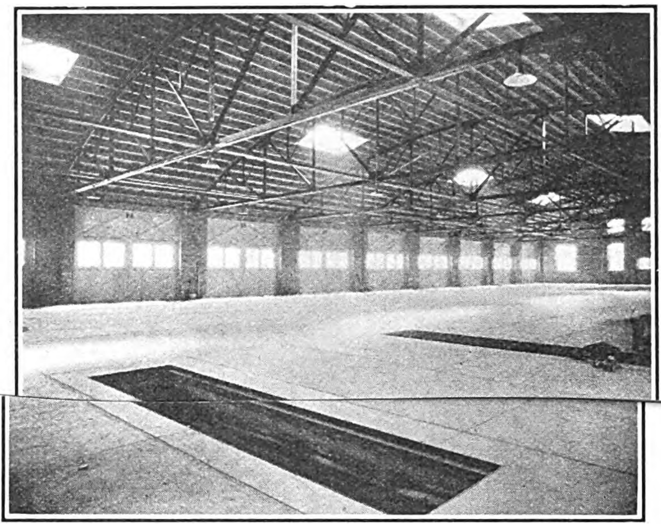
The interior of the garage is open for almost its entire length. The last bay at the north end is occupied by an office, stockroom, locker room and toilet. Fuel for the buses is stored in two 1,000-gal. tanks buried outside the building. The washrack is immediately inside of the entrance door at the south end. This rack drains into a trough 14 in. wide and 12 in. deep, covered with steel grating and connected with the sewer. Swivel pipe connections and hose and washing utensils are mounted on two of the overhead trusses.



Routes of the Co-ordinated Bus and Car Service in Decatur
1—Franklin; 2—East Main; 3—Nelson Park; 4—North Jasper; 5—North Monroe; 6—West Decatur.

Two inspection pits 3 ft. 4 in. wide x 4 ft. 3 in. deep and 18 ft. long are located near the north end of the building. These are covered with removable gratings made up in sections 1 ft. long. Near these pits are located the work benches, test racks and battery charging outfits. No machine tools are in the garage because the railway machine shop is adjacent. The garage is heated by hot air forced over steam pipes and delivered through ducts at a pressure of about 5 in. of water. Inasmuch as the garage will be used mostly at night, ample illumination has been provided by means of three 100-watt shaded lamps on each roof truss. A similar shaded lamp is mounted above each doorway outside the building.

The plan is to have the buses fueled outside, washed immediately after entering the building and then stored in a double row, starting at the north end and facing toward the side with the doors. With this arrangement it is possible to accommodate conveniently 30 buses and an equal number can be parked outside. When the buses pull out in the morning no backing or turning will be necessary inside the garage, but the vehicles can move straight ahead through the double doors. In an emergency all doors can be opened and the buses pushed out by hand, this being possible because there is a slight grade to the land surrounding the building. The doorways and roof trusses have a clearance of 14 ft. 6 in., which is sufficient to permit the passage of a double-deck bus.



Interior of the Garage at Decatur, Showing the Inspection Pits

Detroit Car Cards

THE following are copies of car cards or bulletins used by the Department of Street Railways in Detroit during the past few weeks:

Cross Car Tracks Cautiously! Leaves Falling on the Track Cause Slippery Rails and Prevent Quick Stops.

Street Space.—"There is sufficient space in the average street to take care of two lines of traffic comfortably or three lines in emergency. When cars are parked against the curb on both sides, the available space will be sufficient for only one line of traffic. It is inevitable that congestion and delays must follow."—*Dominick Henry, Deputy Chief Inspector in charge of New York traffic.*

Lost Articles—During the month of September, 1,611 articles were left on the cars of this system. All articles found on D.S.R. cars are sent to the Lost Article Department, which is located at Room 328, 165 Congress Street. If you lose or think you might have left an article on a street car, inquire at the above address, or call Cadillac 2551. This information is given for your convenience and to forestall the ever-increasing number of calls, both personal and telephone, to the various carhouses in regard to lost articles.

Awaiting Common Council Action! D.S.R. is preparing to furnish new motor bus service as soon as a purchase contract is approved. Service will operate to unserved outlying districts direct from the business centers. Six-cylinder pneumatic tires, fully inclosed upper deck. We want the best vehicles—made in Detroit if possible—but the best at any cost.

Changing a Deficit Into a Profit*

In Four Years the Charleston Consolidated Railway & Lighting Company Has Reduced Its Operating Expenses per Car-Mile 35 per Cent, While Its Gross Earnings Decreased Approximately 30 per Cent

HOW to operate the street railway in Charleston, S. C., and make both ends meet has been a problem ever since the World War. In 1920 the population served by the Charleston Consolidated Railway & Lighting Company was approximately 84,000. The next year it had dropped to 78,000. In 1922 it was 72,000, in 1923 it was 66,000, and at the present time it is estimated to be only 58,000. In the face of these conditions it was inevitable that the earnings of the railway should decrease. The reduction in revenue per car-mile from 43.17 cents in 1920 to 29.95 in 1924, a decrease of approximately 30 per cent, is, in fact, slightly less than the per cent decrease in population of the city.

Night foreman	1	1	1
Night workmen	11	8	6
Total	220	166	141

To meet this situation the railway has had to curtail its expenses heavily. This has been done by the inauguration of one-man operation, reducing the number of men employed in the shops, and by reducing the number of car-miles operated. An important saving has also been made in the amount paid for damage claims.

In 1923 the percentage of one-man cars operated to total cars was 51.3, while in 1924 the percentage of one-man cars was 91.3 of the whole. This has made it possible to reduce the number of trainmen from 140 to 90. At the same time radical revisions have been made in the supervisory force and the personnel of the mechanical department. Details of these changes are given in an accompanying table.

The results have been to reduce purely transportation costs per month approximately 20 cents per car-mile down to about 11 cents per car-mile. During the same period the maintenance of equipment has been reduced from 5 cents per car-mile to about 3 cents. In the first six months of 1923 $26,402 was paid in claims. In the same period of 1924 the amount was $6,810. The combined results of these savings has been to convert a deficit of $4,796.70 for June, 1923, into a profit of $4,209.41 for June, 1924.

Classifications	June, 1920	June, 1921	June, 1922	June, 1923	January, 1924	June, 1924
Gross earnings	$76,849.46	$66,234.13	$53,429.62	$45,126.65	$36,426.47	$35,745.68
Operating expenses including taxes	$72,692.42	$60,330.40	$53,420.99	$49,923.35	$35,361.67	$31,536.27

Oklahoma City Enlarges Passenger Station

This Station, Built in 1911, Had Become Outgrown and Has Just Been Enlarged—It Now Has Six Through Tracks—A New Freight ~~Station Has~~ Also Been Built

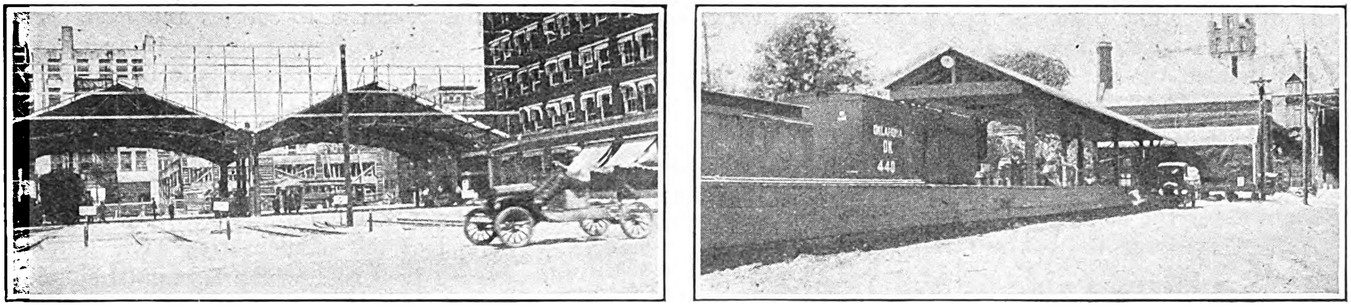
THE Oklahoma Railway recently completed the rearranging and separation of its passenger and freight terminal facilities in Oklahoma City. The old passenger terminal station, which was constructed in 1911, had become inadequate for the volume of traffic passing through it. This was particularly true during the morning and evening rush hours and with the advent of the small one-man safety cars.

In the original layout, the freight station was located just west of and adjoining the passenger station and was served by two short tracks entering from Hudson Street. These two tracks were laid out with short radius curves and would not take all standard equipment. No provision was made for teaming, as the trackage allowed the loading of package freight cars only from the dock. Baggage and express shipments were handled in a small building on the west side of the passenger terminal inclosure.

The original passenger terminal contained two through tracks from Main Street to Grand Avenue, two passing tracks out of these through tracks, and four stub sidings for car storage.

The city and interurban cars were routed to enter the terminal from both directions, and the two outside tracks were reserved for interurban traffic. This condition caused more or less trouble because, when two interurban cars were in and loading, only the two through tracks were available for the city cars.

In the new layout there are six through tracks in the passenger terminal, as shown in the plan. The city cars use the four easterly tracks and the interurban cars the fifth and sixth tracks. All traffic through the new terminal is one way, all cars entering from Grand Avenue. There is also a stub siding, leading off from the sixth track, for the storage of interurban trailers. There is dock room and team space on the west side of the sixth track to provide for the minimum of handling between truck and car.



At Left, New Passenger Terminal Under Construction. At Right, Team Side of New Freight House

All the new special trackwork on Grand Avenue, made necessary by these changes, is laid with wood ties and ballast, while all tracks, including special work within the terminal inclosure, are on steel ties, Carnegie H section, with a reinforced-concrete beam under each rail. Paving brick was placed outside the rail for a border, and one row of brick was placed inside the rail to provide for the flangeway. The old train shed was divided into two sections, and these two sections were placed alongside each other, thus providing overhead protection for the entire six tracks.

A 4-in. slab of concrete was poured alongside the tracks for platform space.

Concrete pits were installed at the south end of the terminal and just inside the north property line on Grand Avenue. These pits are to be kept filled with water and are illuminated at night with a series of red lights to keep trespassers out.

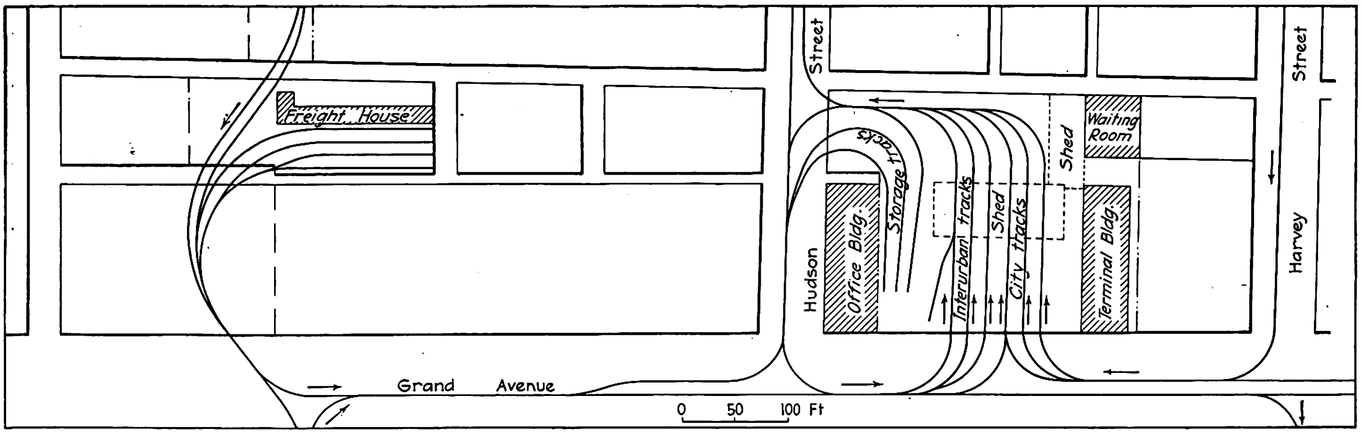
The tracks shown in the plan as entering the terminal from Hudson Street on the west side formerly served the old freight terminal. These tracks, later, are to be lengthened and used for storage tracks.

Several electric track switches have been installed. One is at the turnout to the interurban tracks on Grand Avenue, one at the wye just off Hudson Street at the west side of the terminal yard, and one at the wye at Main and Hudson Streets. Some additional track had also to be built to route the cars one way through the terminal. No change has been made in the method of handling passengers into and out of the terminal inclosure.

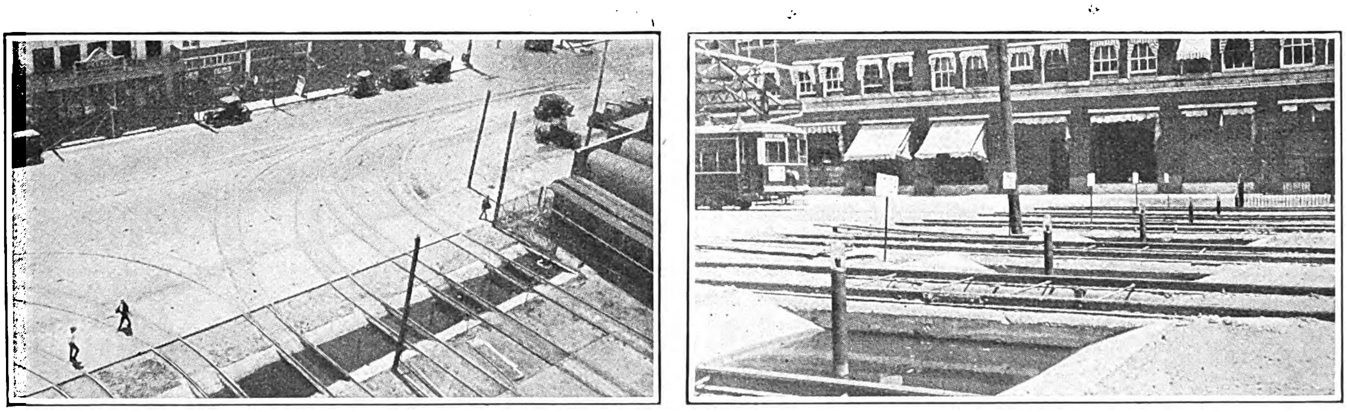
A NEW FREIGHT HOUSE BUILT

The new freight house is located one block west of the passenger station and is served by one through track from Main Street to Grand Avenue and one passing track.

The freight dock is 20 ft. x 130 ft. and has 80 ft. under roof. The driveways to the dock and team tracks are ballasted with crushed rock, the rock being covered with limestone screenings and the screenings with crude oil to give a good surface and to keep down the dust. Freight offices and a warehouse were constructed at the west end of the freight dock. The alleys on both



Plan Showing New Station Layout, Oklahoma City



Arrangement of Pits and Red Lights to Prevent Unauthorized Entrance to Passenger Terminal from Street sides of the freight station are paved with brick, which makes the dock accessible in all kinds of weather.

All labor on the passenger and freight stations was done with company forces. With the exception of the special work layout at the north end of the passenger terminal, which was purchased new, the special work required was taken from material on hand and assembled for the various locations.

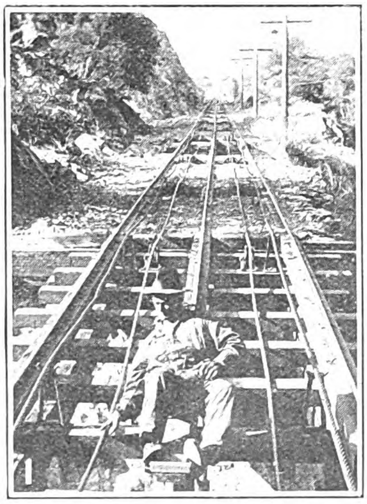
Replacing Cable on the Mount Lowe Incline

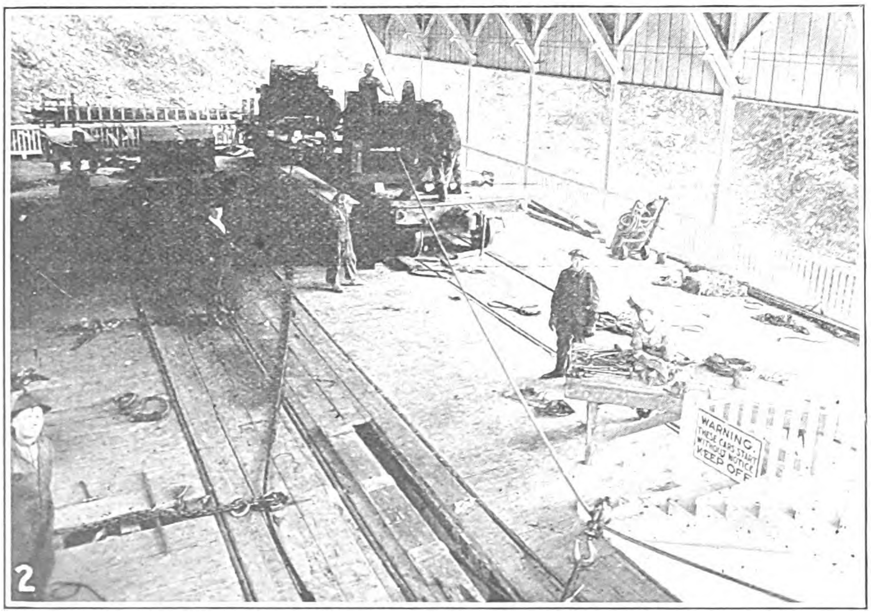
THE replacement of the pulling cable on the Mount Lowe Incline, a 62-deg. grade between Rubio and Echo Mountain on the Pacific Electric Railway scenic route in southern California, was accomplished some time ago by the mechanical department of the company. On account of the grade and unique physical conditions existing the replacement of this cable was a difficult engineering feat. This route was constructed in 1893 and has been operated since that time by the Pacific Electric Railway. Two passenger cars are operated on this incline to convey sightseers to Alpine Tavern, a mile up the mountain.

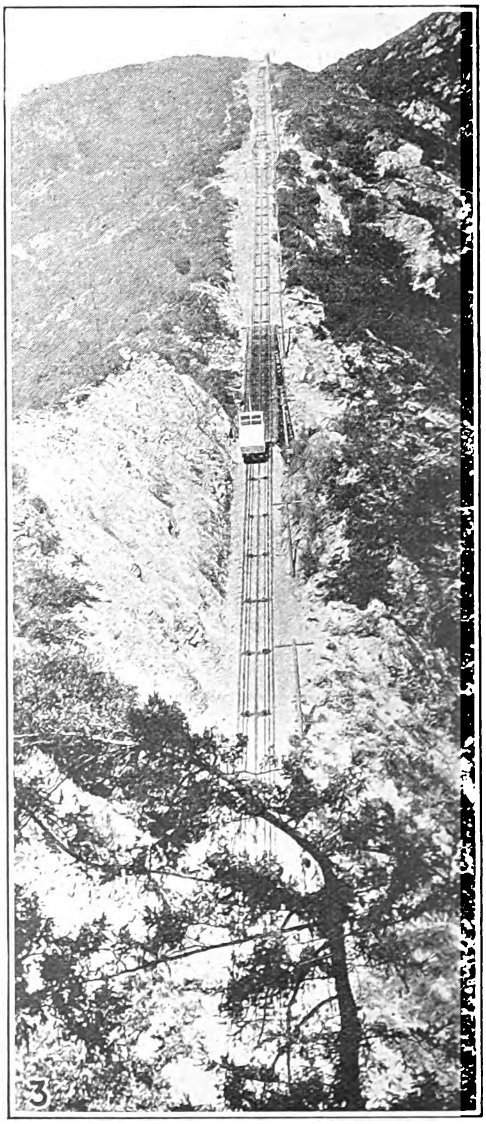
The pulling cable on the incline is 3,000 ft. in length and weighs more than 6 tons. It is replaced at intervals ranging from two to three years, its condition being determined by hand inspection and examination over its entire length every week. Extensive preparations, considerable equipment and a trained crew of 12 mechanics are required to make the change. A 35-hp. motor is used to drive a revolving cable reel capable of receiving the entire 6 tons of discarded cable. The motor and reel, together with the reel containing the new cable, are mounted on a flat car anchored at the foot of the incline, as shown in an accompanying illustration.

The cable is in the form of a loop, the section ahead of the car being known as the "pulling cable" because it carries the load. The section behind the car is known as the compensating cable because its only function is to take up the slack. When preliminaries have been completed the pulling cable is cut with an acetylene torch at a point about 60 ft. behind the lower car. The new cable is then spliced into the old pulling cable. The cars are chained into position on the incline before the pulling clamps are removed. The end of the compensating cable is made fast to the power-driven reel, which is started simultaneously with the cable winding machinery at the top of the mountain. While the new cable is being pulled into position the old cable is being reeled up. Care must be taken that the speed of the reel coincides with the speed of the winding machinery. The entire length of the incline must be under observation while the change is being made to make sure that the new cable does not jam or leave the guiding pulley.

The job was done under the direction of J. W. Haughton, assistant mechanical superintendent, who has supervised this work since 1909. Several members of the crew have taken part in this work for the past 20 years. In spite of the familiarity of the men with the work it requires about 20 hours before the line is again ready for service.







Features of Cable Replacement on the Mount Lowe Incline, Pacific Electric Railway

No. 1. Mechanics make a weekly inspection of the cable, using a special sled.

No. 2. A motor-driven reel to wind up the old cable and another reel containing the new cable are mounted on a flat car at the foot of the incline.

No. 3. A new cable was recently installed on the Mount Lowe Incline, which rises 1,300 ft. at a 62-deg. grade.

Modern Planning System in Detroit Shops

Department of Street Railways Has Developed System for Checking Progress of Work on Cars in Various Departments of Highland Park Shops — Cumulative Curves Give Daily Information on Production

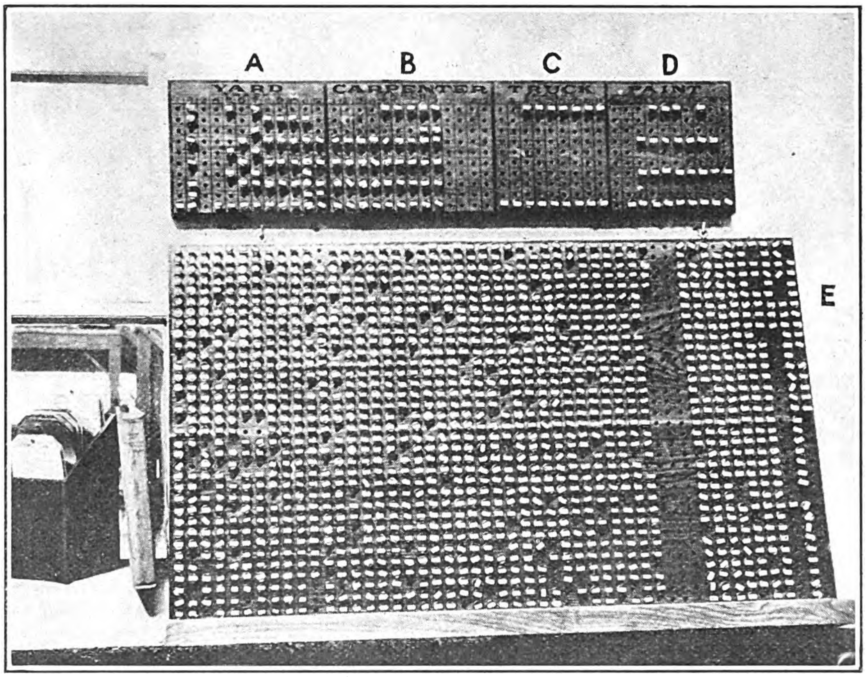
By G. L. Ohmart

General Foreman Highland Park Shops,
Department of Street Railways, Detroit, Mich.

CENTRALIZED planning and production control are necessary for a well-regulated and efficient business. The planning systems in use in the large manufacturing plants have demonstrated their worth over and over again. While the methods employed in planning for a manufacturing plant can be only partially applied to a maintenance shop, the principles involved are the same in both cases.

Up to the present time the functions of the planning department in the Highland Park shops of the Detroit Department of Street Railways are confined to the handling of cars from the time they come to the shops until they are taken away, and to keeping such records and charts as have been found useful in carrying out the work. No attempt as yet has been made to do the detailed planning of the work of each shop department, although this is under consideration.

When a car is sent to the shops for any class of work, a form, shown in an accompanying illustration, is filled out by the carhouse foreman with car number, name of the carhouse, and a general notation of the reason for the car being sent in. This card (Form 246) is then turned over to the yard master of the operating department, who fills out the detachable part of the card with the car number, time the car leaves the carhouse, and the badge numbers of the crew which will take the car to the shop. The card is taken to the shops with the car and turned over to the planning clerk, who enters on the detachable part of the card the time the car is received, and signs the card. This stub is then detached and taken back to the yard master. It not only serves as a record of the movement of the car, but also as a receipt of the delivery of the car to the shops and a check on the time the crew arrived.



Car Numbers on Plugs Show Where the Cars Are in the Shops

Location of all cars in the shop is indicated on the upper plug board. This is divided into four sections to indicate the various departments. The holes in each section correspond with the car locations on each track in that department of the shop. The lower and larger board indicates cars in service at carhouses, and contains plugs arranged in numerical order for quick reference.

The planning clerk, who is in touch with all the shop foremen, enters on Form 246 the account numbers for each class of work and a description of the various classes of work to be done, such as wiring changes, overhauling trucks, painting, etc. This card is then fastened to the car to remain until all the work is finished and the car is ready to leave the shop.

PLANNING PROGRESS OF THE CAR

When a car is delivered to the shop, it is left in the yard by the train crew. The planning clerk has direct charge of the movement (shifting) of all cars at the shops and also of the men (shifters) who do this work. Assuming that work on the car is to be started in the carpenter shop, Form 247, shown in another illustration, is used to instruct the shifters. This form is made up on green paper in pads 4 in. x 6 in. size. It will be noted that spaces are provided for car number, date, and two series of locations; "from," which indicates present location of the car, and "to," indicating where it is be moved.

Assume that the car is on Track 9 in the yard, and is to be moved to Track 2 in the carpenter shop. Under "From" the planning clerk checks an "X" opposite "yard" and writes in "Track 9." Under column headed "To" he checks "X" opposite "Carp," writes in "Track 2" and gives the time. This form is turned over to one of the shifting crew and furnishes complete information regarding the movement of the car. He delivers the car to the proper track in the carpenter shop and turns over Form 247 to the carpenter foreman. This is notification to the foreman that the car is in his department, at a certain location, ready for work.

When any particular job is completed on a car, the foreman in charge of this work enters in the column headed "Repairs made by" the badge number of the man or men who did the work, and also signs his own initials,

At top (Form 248)—Form used by the planning clerk in connection with his work. This serves as a permanent record of the location of all cars in the shop.

Below (Form 371)—A complete record of all car movements to and from the shop is kept on these daily sheets, which are signed by car crews.

(Form 247)—The planning clerk issues instructions on this form for shifting cars between departments in the shop.

indicating that the work has been completed properly. When all the work to be done by that department is completed on the car the foreman notifies the planning clerk by telephone that it is ready to leave his department, gives its present location and the next department to which it is to be moved. The planning clerk again uses Form 247 to notify one of the shifting crews that this particular car is on Track 2 in the carpenter shop and is to be moved to Track 4 in the truck shop. The shifter moves the car and turns over the form to the truck shop foreman. This procedure is repeated for each movement of the car.

When all the work of the various shop departments is completed, the car goes back to the yard ready to be taken to the carhouse. Form 246 is now removed and filed for future reference, as it gives a complete record of work done, workmen's numbers, job numbers, account numbers to which labor and material were charged, the date, and the foremen's signatures, indicating that the work was carried out properly.

(Form 246)—This form indicates the work to be done in each department, the badge numbers of the men, the account chargeable and the signature of the foreman who approved the completed job. The stub at the bottom is sent back to the carhouse as a receipt when the car is delivered to the shop.

The location of all cars in the shops is indicated on a board in the planning clerk's office by means of plugs having the car numbers stamped on them. The board has a series of holes for each track in the yard and the various shop departments. An accompanying illustration shows the arrangement. It can be seen from this that the upper board is divided into four sections. Section A represents the yard, B the carpenter shop, C the truck shop, and D the paint shop. The large board E, below, holds the plugs for all the cars which are in service at the various carhouses. The plugs in the large board are arranged in numerical order so that it is easy to pick out any particular car number wanted.

Simultaneously with the movement of the car, the plug with that car number on it is moved to the proper place to indicate the location of the car. This part of the system is very useful, both to the planning department and to the executives, who can tell at a glance exactly where a car is located, as well as the number of cars in the different shop departments.

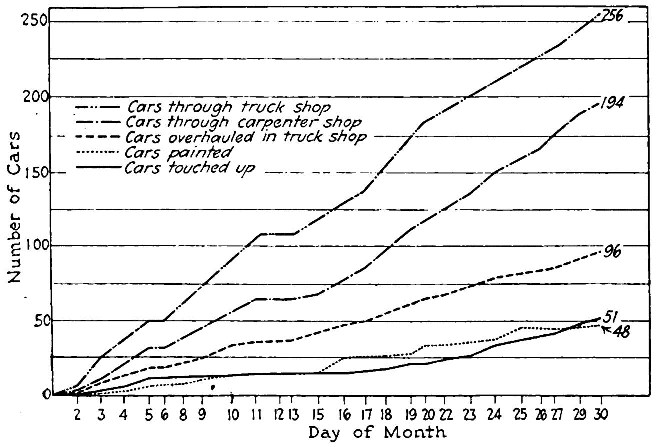
In the case of a car which has been in an accident and on which all costs of repairing due to the accident are kept separate from regular maintenance, a separate job number is issued. Form 245, which is a tag exactly like 246 except that it is red instead of yellow, is used either separately or in conjunction with the latter to give the job number and account numbers on the work done due to the accident. When both regular maintenance work and work due to accident are necessary on a car, both cards are clipped together and placed in the car for the information of the shop men concerned.

Two other forms are used by the planning department to keep records. Form 371, also shown in an illustration, is a sign-in and out sheet. All entries on this sheet are made by the crews of the transportation department who take cars to and from the shops, a new sheet being used each day. The operator enters in the proper columns the car number, the line on which the car is operated regularly, and the time it arrives at or leaves the shop, as the case may be.

Form 248 is used by the planning clerk chiefly for his own information in carrying out the details of his work. When a car is received at the shop, the car number is entered in the proper column and the date under "Yard." Then as the car goes through the various shop departments, the date is checked under the proper column when it enters that department. When the car is finished, the date is entered when the car is reported out to the carhouse. There are also columns for shop order and account numbers.

PRODUCTION CURVES PLOTTED MONTHLY

In connection with the planning, a number of progress or production curves are kept daily for periods of a month each. A typical curve sheet is illustrated. These curves are plotted cumulatively so that at the end of any period, beginning with the first of the month, the total is given to date. The abscissas represent the actual number of working days in the month, whole days and half days being given proper value. The ordinates give the number of cars. By one subtraction, the production for any other period of time can be obtained. A straight line drawn through zero and the point at the end of any period gives the average daily production. In case there is a definite production to work to for a month, a straight line through zero and the total value for the month represents the actual average amount required per day, and the deviation of the actual production curve from the straight line represents at any time the exact amount that production is ahead of, or behind, the requirements.



Charts Show Daily Production of Each Department

Cumulative curves are used to record production and show the monthly totals up to any given date. These sheets are made up 9 in. x 12 in., and the various items of production are shown in different colored lines.

At the present time curves are being made up for the following items: Total cars received, total cars out of shops, cars through the carpenter shop, cars through truck shop, cars through paint shop, accident cars through the shops, car wheels welded, car wheels bored, car wheels pressed on, car wheels pressed off, motor gears changed, car wheels turned, car wheels ground, stoves replaced and stoves rebuilt.

Similar curves can be worked out to meet the particular needs of any shop, and may be used to keep daily progress on any kind of shop work. The value of such curves to the shop executives can hardly be overestimated. They furnish him in a moment's time with a simple picture which tells him just what each shop department is doing and enables him to co-ordinate readily the shop work with the requirements.

The Readers' Forum

Sixteen Hundred Butt Welds in Philadelphia

THE LORAIN STEEL COMPANY
JOHNSTOWN, PA., Nov. 21, 1924.

To the Editors:

In the article on "Rapid Track Reconstruction with Butt-Welded Joints," which appeared in the Nov. 15 issue of the ELECTRIC RAILWAY JOURNAL, the statement is made that butt-welded joints were tried in Boston and in Philadelphia, about 500 joints being made in each place. While this is correct as far as Boston is concerned, more than three times this number were made in Philadelphia. To be exact, 1,607 butt welds have been installed in the latter city.

Superintendent Track Welding Department.

Canadian Highway Tax Not Discriminatory

HYDRO-ELECTRIC POWER COMMISSION
OF ONTARIO
Hydro-Electric Railways Operating Department

TORONTO, ONT., OCT. 31, 1924.

To the Editors:

After commenting on the conditions of electric railway operation in Canada in ELECTRIC RAILWAY JOURNAL for Oct. 25, page 749, you refer to a statement of the *Canadian Financial Post* in the last part of which it is stated that the bus license fee is not an equitable tax inasmuch as it is not on the same basis for all bus lines. The statement also contends that the buses in direct competition with hydro radials are being taxed so high and in such an arbitrary manner as to prevent them giving adequate service. For your information I would say that the tax is imposed by the Department of Provincial Highways and is, according to its statement, the same on all provincial highways, no discrimination being shown in any way against the bus lines operating in opposition to the Hydro-Electric Railways—in fact, it really is to the contrary. The act became effective and was enforced commencing June 1, 1924. We have three lines in competition with buses. On our Scarboro division the tax became effective on June 1; on the Metropolitan division it did not become effective until Sept. 1, while on the Mimico division, where we are affected most, it is not in effect as yet but it is expected that it will become effective on Nov. 15.

This certainly does not show discrimination in favor of the Hydro, and I am satisfied that by calling your attention to this misstatement you will correct the impression that was unwittingly created.

This is the type of propaganda which is being used against the Hydro at all times by those opposed to public ownership.

W. R. ROBERTSON,
General Superintendent.

Committee on Co-operation with Manufacturers

E. F. Wickwire, vice-president Ohio Brass Company, Mansfield, Ohio, chairman.
G. A. Barnes, New York, N. Y.
William C. Bell, Richmond, Va.
W. D. Blatz, Bridgeport, Conn.
W. H. Boyce, Pittsburgh, Pa.
E. C. Faber, New York, N. Y.
W. H. Gibson, Brooklyn, N. Y.
E. E. Kretschmer, Chicago, Ill.
H. H. Lloyd, Indianapolis, Ind.
E. B. Meissner, St. Louis, Mo.

David Cameron, New York, N. Y.
J. R. MacFarland, Philadelphia, Pa.
J. C. McQuiston, East Pittsburgh, Pa.
G. R. Rowland, New York, N. Y.
J. F. Sloan, New York, N. Y.
C. N. Uhl, Akron, Ohio.
C. L. Van Auken, Chicago, Ill.
P. L. Thomson, New York, N. Y.

CO-OPERATION WITH STATE AND SECTIONAL ASSOCIATIONS

P. H. Gadsden, vice-president the United Gas Improvement Company, Philadelphia, Pa., chairman.
P. A. Bertrand, Aberdeen, Wash.
John S. Bleecker, Philadelphia, Pa.
F. G. Buffe, Kansas City, Mo.
F. D. Burpee, Ottawa, Canada.
F. C. Chambers, Des Moines, Ia.
G. H. Clifford, Fort Worth, Tex.
J. F. Collins, Jackson, Mich.
F. B. Culley, Augusta, Ga.
E. W. Fowler, Chicago, Ill.
J. W. Hancock, Roanoke, Va.
A. M. Patten, Topeka, Kan.
J. S. Pevear, Birmingham, Ala.
William Phipps, Meridian, Miss.
J. P. Pulliam, Milwaukee, Wis.
J. C. Schade, Green Bay, Wis.
O. J. Shaw, Lincoln, Neb.
T. H. Tutwiler, Memphis, Tenn.
E. A. West, Denver, Col.
C. V. Wood, Springfield, Mass.

COMMUNITY SECTION, COMPANY SECTION AND INDIVIDUAL MEMBERSHIP

C. E. Morgan, vice-president and general manager Brooklyn City Railroad, Brooklyn, N. Y., chairman.
G. B. Anderson, Los Angeles, Cal.
C. H. Beck, New York, N. Y.
C. P. Billings, Pittsburgh, Pa.
F. G. Buffe, Kansas City, Mo.
H. O. Butler, St. Louis, Mo.
T. C. Cherry, Syracuse, N. Y.
C. H. Clark, Cleveland, Ohio.
W. H. Heulings, Jr., Philadelphia, Pa.
S. B. Irelan, St. Joseph, Mo.
A. E. Potter, Providence, R. I.
Martin Schreiber, Camden, N. J.
S. B. Way, Milwaukee, Wis.

EDUCATION

Edward Dana, general manager Boston Elevated Railway, Boston, Mass., chairman.
H. O. Allison, New Brighton, Pa.
George B. Anderson, Los Angeles, Cal.
George A. Barnes, New York, N. Y.
V. W. Berry, Fort Worth, Tex.
Horatio Bigelow, Charleston, S. C.
G. B. Cade, Asbury Park, N. J.
W. J. Edmunds, Pittsburgh, Pa.
J. A. Greenland, Fort Wayne, Ind.
C. J. Griffith, Little Rock, Ark.
W. W. Holden, San Antonio, Tex.
J. S. Hyatt, Highwood, Ill.
M. B. Lambert, East Pittsburgh, Pa.
Richard J. Lockwood, St. Louis, Mo.
M. McCants, San Francisco, Cal.
H. H. Norris, New York, N. Y.
A. B. Paterson, New Orleans, La.
Samuel Riddle, Louisville, Ky.
A. J. Rowland, Milwaukee, Wis.
R. Schaddelee, Grand Rapids, Mich.
J. V. Sullivan, Chicago, Ill.
E. M. Walker, Schenectady, N. Y.

INSURANCE

P. E. Wilson, secretary Cleveland Railway, Cleveland, Ohio, chairman.
W. R. Alberger, Oakland, Cal.
O. H. Bernd, Des Moines, Ia.
Granville H. Bourne, New York, N. Y.
C. E. Brown, Napa, Cal.
E. J. Burdick, Detroit, Mich.
Norman McD. Crawford, Columbus, Ohio.
N. H. Daniels, Boston, Mass.
F. M. Hamilton, Chicago, Ill.
A. D. Knox, New Haven, Conn.
John H. Moran, Boston, Mass.
C. E. Morgan, Brooklyn, N. Y.
L. D. Pellissier, Holyoke, Mass.
F. J. Petura, New York, N. Y.

LOCATION OF MIDYEAR MEETING AND CONVENTION

W. H. Sawyer, president East St. Louis & Suburban Railway, East St. Louis, Ill., chairman.
M. R. Boylan, Newark, N. J.
H. L. Brown, New York, N. Y.
C. C. Castle, New York, N. Y.
S. J. Cotsworth, Philadelphia, Pa.
E. C. Faber, New York, N. Y.
Thomas Finigan, Chicago, Ill.
Thomas Fitzgerald, Pittsburgh, Pa.
H. B. Flowers, New Orleans, La.
Edward M. Graham, Bangor, Me.
A. A. Hale, New York, N. Y.
J. C. McQuiston, East Pittsburgh, Pa.
C. E. Morgan, Brooklyn, N. Y.
Paul Shoup, San Francisco, Cal.
Claus Spreckels, San Diego, Cal.
E. P. Waller, Schenectady, N. Y.
T. W. Wilson, Wilmington, Del.

REVISION OF CONSTITUTION AND BY-LAWS

L. S. Storrs, president The Connecticut Company, New Haven, Conn., chairman.
H. C. Clark, Newark, N. J.
C. R. Ellicott, New York, N. Y.
C. D. Emmons, Baltimore, Md.
J. G. Barry, Schenectady, N. Y.

SPECIAL TAXES

W. H. Maltbie, special counsel United Railways & Electric Company of Baltimore, Baltimore, Md., chairman.
F. C. Chambers, Des Moines, Iowa.
F. W. Coen, Sandusky, Ohio.
A. T. Davison, New York, N. Y.
Thomas Fitzgerald, Pittsburgh, Pa.
R. M. Feustel, Fort Wayne, Ind.
A. Flor, New York, N. Y.
Edwin Gruhl, New York, N. Y.
Harry H. Hanson, Newtonville, Mass.
Raymond Hunt, Wilmington, N. C.
A. G. Neal, Washington, D. C.
A. M. Robertson, Duluth, Minn.
H. B. Sawyer, Boston, Mass.
A. C. Watt, New York, N. Y.
T. W. Wilson, Wilmington, Del.

VALUATION

F. W. Doolittle, vice-president North American Company, New York, N. Y., chairman.
E. J. Bechtel, New York, N. Y.
Francis Blossom, New York, N. Y.
H. M. Brinckeroff, New York, N. Y.
H. A. Clarke, New York, N. Y.
Thomas Conway, Jr., Philadelphia, Pa.
J. A. Emery, New York, N. Y.
W. Findlay Downs, Philadelphia, Pa.
T. E. Francis, St. Louis, Mo.
C. W. Gillespie, Staten Island, New York, N. Y.
F. C. Hamilton, New York, N. Y.
W. H. Maltbie, Baltimore, Md.
L. R. Nash, Boston, Mass.
A. S. Richey, Worcester, Mass.
Frank Silliman, New York, N. Y.
Ernest Stenger, Denver, Col.
W. B. Tuttle, San Antonio, Tex.
E. D. Uhlendorf, Chicago, Ill.
James Walker, Chicago, Ill.

UNITED STATES CHAMBER OF COMMERCE REPRESENTATIVES

J. H. Hanna, vice-president Capital Traction Company, Washington, D. C., national councillor.

C. E. Morgan, vice-president and general manager Brooklyn City Railroad, Brooklyn, N. Y., substitute national councillor.

JOINT COMMITTEE OF THE NATIONAL UTILITY ASSOCIATIONS

Randal Morgan, chairman of the executive and finance committee United Gas Improvement Company, Philadelphia, Pa., chairman.
F. R. Coates, Toledo, Ohio.
C. D. Emmons, Baltimore, Md.
P. H. Gadsden, Philadelphia, Pa.
J. H. Pardee, New York, N. Y.
J. N. Shannahan, Hampton, Va.
R. P. Stevens, New York, N. Y.
L. S. Storrs, New Haven, Conn.
James W. Welsh, New York, N. Y.

CO-OPERATION WITH THE NATIONAL SAFETY COUNCIL

J. P. Barnes, president Louisville Railway, Louisville, Ky., chairman.

The following American committees and representatives on national organization's committees were continued from last year without change in personnel:

American Committee on Electrolysis.
American Committee on Inductive Co-ordination.
Conference on Street and Highway Safety.
Mail Pay Committee.
National Defense.
National Industrial Conference Board.
Sub-Committee of the Committee on National Relation on Depreciation.

Engineering Association

AUTOMATIC SUBSTATIONS

Adrian Hughes, Jr., superintendent of power United Railways & Electric Company of Baltimore, Baltimore, Md., chairman.
L. D. Bale, Cleveland, Ohio.
W. E. Bryan, St. Louis, Mo.
C. A. Butcher, East Pittsburgh, Pa.
C. H. Jones, Chicago, Ill.
F. W. Peters, Schenectady, N. Y.
Ralph H. Rice, Chicago, Ill.
L. R. Wagner, Detroit, Mich.
E. H. Scofield, Minneapolis, Minn., sponsor.

BUILDINGS AND STRUCTURES

W. F. Graves, chief engineer Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., chairman.
E. D. Eckroad, Akron, Ohio.
George H. Hodges, New York, N. Y.
J. D. Kent, New York, N. Y.
J. R. McKay, Fort Wayne, Ind.
F. H. Miller, Louisville, Ky., sponsor.
E. S. Myers, New Orleans, La.

H. R. Stamm, New Haven, Conn.
S. J. Steiner, Aurora, Ill.
Judson Zimmer, Gloversville, N. Y.

Car and Carhouse Wiring

H. H. Adams, superintendent shops and equipment Chicago Surface Lines, Chicago, Ill., chairman.
R. S. Beers, Schenectady, N. Y.
A. T. Clark, Baltimore, Md.
H. C. Eddy, Newark, N. J.
C. G. Keen, Philadelphia, Pa.
John Lindall, Boston, Mass., vice-chairman.
J. D. McKee, Champaign, Ill.
G. H. McKelway, Brooklyn, N. Y.
G. M. Woods, East Pittsburgh, Pa.

Engineering Accounting

(Joint Committee)

R. B. Rifenberick, valuation engineer United Railways & Electric Company of Baltimore, Baltimore, Md., chairman.
E. J. Dickson, Providence, R. I.
N. E. Drexler, Hampton, Va.
E. D. Dreyfus, Pittsburgh, Pa.
C. R. Harte, New Haven, Conn., sponsor.
F. R. Phillips, Pittsburgh, Pa.
A. S. Richey, Worcester, Mass.
H. E. Riggs, Ann Arbor, Mich.

Engineering Manual

R. C. Cram, engineer surface roadway Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., chairman.
Daniel Durie, Connellsville, Pa.
C. R. Harte, New Haven, Conn.

Equipment

P. V. C. See, superintendent car equipment Northern Ohio Traction & Light Company, Akron, Ohio, chairman.
W. S. Adams, Philadelphia, Pa.
W. W. Brown, Brooklyn, N. Y.
R. S. Bull, Pittsburgh, Pa.
A. T. Clark, Baltimore, Md., vice-chairman.
Daniel Durie, Connellsville, Pa., sponsor.
Lawford H. Fry, Burnham, Pa.
J. L. Gould, New York, N. Y.
J. M. Hipple, East Pittsburgh, Pa.
A. C. Jordan, Elmira, N. Y.
J. H. Lucas, Milwaukee, Wis.
W. H. McAloney, Atlanta, Ga.
J. C. McCune, New York, N. Y.
A. D. McWhorter, Memphis, Tenn.
J. F. Miller, Pittsburgh, Pa.
M. O'Brien, St. Louis, Mo.
E. D. Priest, Schenectady, N. Y.
E. S. Sawtelle, Cincinnati, Ohio.
R. B. Smyth, Boston, Mass.
C. W. Squier, New York, N. Y., secretary.
W. G. Stuck, Lexington, Ky.
H. S. Sweet, Utica, N. Y.
H. S. Williams, Detroit, Mich.
J. M. Yount, San Francisco, Cal.

Heavy Electric Traction

John C. Davidson, engineer electric traction Norfolk & Western Railway, Bluefield, W. Va., chairman.
A. H. Armstrong, Schenectady, N. Y.
J. M. Bosenbury, Springfield, Ill.
C. E. Brown, Napa, Cal.
H. F. Brown, New Haven, Conn., secretary.
Morris Buck, New York, N. Y.
H. W. Cope, East Pittsburgh, Pa.
A. B. Daus, Chicago, Ill.
J. H. Davis, Baltimore, Md.
J. V. B. Duer, Altoona, Pa.
J. T. Hamilton, New York, N. Y.
Charles R. Harte, New Haven, Conn., sponsor.
E. C. Johnson, Los Angeles, Cal.
Norman Litchfield, New York, N. Y.
J. O. Madison, New York, N. Y.
L. S. Wells, New York, N. Y.
R. B. White, New York, N. Y.

Power Generation and Conversion

L. D. Bale, superintendent of substations Cleveland Railway, Cleveland, Ohio, chairman.
C. E. Bennett, Atlanta, Ga.
W. E. Bryan, St. Louis, Mo., vice-chairman.
C. A. Butcher, East Pittsburgh, Pa.
H. W. Codding, Newark, N. J.
H. T. Connolly, Annapolis, Md.
H. E. Davis, Utica, N. Y.
H. A. Kidder, New York, N. Y.
E. D. G. Kline, Allentown, Pa.
N. R. Love, Denver, Col.
F. W. Peters, Schenectady, N. Y.
G. G. Post, Milwaukee, Wis.
G. W. Saathoff, New York, N. Y.
E. H. Scofield, Minneapolis, Minn., sponsor.
L. G. Tighe, Akron, Ohio.
L. J. Turley, Los Angeles, Cal.
R. L. Weber, Boston, Mass.
G. I. Wright, Chicago, Ill.

Power Transmission and Distribution

Charles H. Jones, electrical engineer Chicago Rapid Transit Company, Chicago, Ill., chairman.
J. Walter Allen, Boston, Mass.
R. L. Allen, Syracuse, N. Y.
S. H. Anderson, Los Angeles, Cal.
W. H. Bassett, Waterbury, Conn.
M. W. Cooke, Pittsburgh, Pa.
S. M. Day, Rochester, N. Y.
J. H. Drew, Mansfield, Ohio.
Ralph W. Eaton, Providence, R. I.
D. D. Ewing, Lafayette, Ind.
Charles Gilman, New York, N. Y.
H. W. Griffin, New York, N. Y.
C. L. Hancock, Bridgeport, Conn.
C. J. Hixson, Schenectady, N. Y.
W. E. Huber, Cleveland, Ohio.
Adrian Hughes, Jr., Baltimore, Md.
John Leisenring, Springfield, Ill.
F. McVittie, Rochester, N. Y.
H. S. Murphy, Philadelphia, Pa.
C. P. Nachod, Louisville, Ky.
J. F. Neild, Toronto, Ontario, Canada.
W. J. Quinn, New York, N. Y.
M. B. Rosevear, Newark, N. J., sponsor.
W. Schaake, East Pittsburgh, Pa.
A. Schlesinger, Indianapolis, Ind.
J. M. Waldron, New York, N. Y.
F. J. White, New York, N. Y.

Purchases and Stores

H. H. Lloyd, purchasing agent Indianapolis Street Railway, Indianapolis, Ind., chairman.
J. Y. Bayliss, Richmond, Va.
R. H. Dalgleish, Washington, D. C., sponsor.
M. L. Evans, Columbus, Ohio.
J. Fleming, Washington, D. C.
W. N. Ford, Memphis, Tenn.
C. A. Harris, Pittsburgh, Pa.
A. E. Hatton, Pittsburgh, Pa.
F. A. Jordon, Atlanta, Ga.
A. C. Kennedy, Cleveland, Ohio.
P. F. McCall, Highwood, Ill.
A. A. Ordway, Boston, Mass.
C. Thorburn, Los Angeles, Cal.
F. L. Wheaton, Detroit, Mich.

Standards

Charles Rufus Harte, construction engineer The Connecticut Company, New Haven, Conn., chairman.
H. L. Andrews, Schenectady, N. Y.
C. C. Beck, Mansfield, Ohio.
J. A. Brooks, Philadelphia, Pa.
L. C. Datz, Memphis, Tenn.
W. G. Gove, Brooklyn, N. Y.
H. A. Johnson, Chicago, Ill.
C. G. Keen, Philadelphia, Pa.
John Lindall, Boston, Mass.
G. A. Peabody, Cleveland, Ohio.
F. R. Phillips, Pittsburgh, Pa.
M. B. Rosevear, Newark, N. J.
H. M. Steward, Boston, Mass.
N. W. Storer, East Pittsburgh, Pa.
N. B. Trist, Pittsburgh, Pa.

Subjects

Charles Rufus Harte, construction engineer The Connecticut Company, New Haven, Conn., chairman.
Morris Buck, New York, N. Y.
R. C. Cram, Brooklyn, N. Y.
R. H. Dalgleish, Washington, D. C.
Daniel Durie, Connellsville, Pa.

Unification of Car Design

H. H. Adams, superintendent shops and equipment, Chicago Surface Lines, Chicago, Ill., chairman.
J. A. Brooks, Philadelphia, Pa.
R. H. Dalgleish, Washington, D. C., sponsor.
L. J. Davis, Brooklyn, N. Y.
Charles Gordon, Chicago, Ill.
W. F. Graves, Indianapolis, Ind.
J. W. Hulme, New York, N. Y.
G. L. Kippenberger, St. Louis, Mo.
John Lindall, Boston, Mass.
Victor Willoughby, New York, N. Y.

Way Matters

H. H. George, engineer maintenance of way Public Service Railway, Newark, N. J., chairman.
V. Angerer, Easton, Pa.
C. A. Alden, Steelton, Pa.
S. C. Baker, East St. Louis, Ill.
E. E. Barnard, Lynchburg, Va.
H. E. Bean, Syracuse, N. Y.
R. H. Dalgleish, Washington, D. C., sponsor.
H. H. Dartt, Williamsport, Pa.
T. H. David, Indianapolis, Ind.
W. R. Dunham, Jr., Detroit, Mich.
E. B. Entwisle, Johnstown, Pa.
T. A. Ferneding, Dayton, Ohio.
R. B. Fisher, Harvey, Ill.
C. F. Gailor, New York, N. Y.
Fred Glenton, Jr., Toronto, Canada.
D. J. Graham, Youngstown, Ohio.
C. L. Hawkins, St. Louis, Mo.
J. H. Haylow, Memphis, Tenn.
H. C. Heaton, Philadelphia, Pa.
N. M. Hench, Pittsburgh, Pa.
M. M. Johnston, New Haven, Conn.
T. J. Lavan, Cleveland, Ohio.
B. P. Legare, San Francisco, Cal.
E. L. Lockman, Boston, Mass.
H. F. Merker, Brooklyn, N. Y.
L. A. Mitchell, Anderson, Ind.
R. H. Pinkley, Milwaukee, Wis.
E. M. T. Ryder, New York, N. Y.
A. T. Spencer, Toronto, Ontario, Canada.

J. B. Tinnon, New York, N. Y.
W. W. Wysor, Baltimore, Md.

U. S. DEPARTMENT OF COMMERCE COMMITTEE TO CO-OPERATE ON SUBJECT OF STANDARDIZATION

R. H. Dalgleish, chief engineer Capital Traction Company, Washington, D. C., chairman.
C. S. Kimball, Washington, D. C.
W. W. Wysor, Baltimore, Md.

SPECIAL COMMITTEE ON AIR RESERVOIR SPECIFICATIONS TO CO-OPERATE WITH THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS

R. H. Dalgleish, chief engineer Capital Traction Company, Washington, D. C., chairman.
L. J. Davis, Brooklyn, N. Y.
C. A. Ives, Erie, Pa.
J. A. Leeper, Wilmerding, Pa.
J. S. McWhirter, New York, N. Y.

WOOD PRESERVATION

A. P. Way, electrical engineer American Electric Power Company, Philadelphia, Pa., chairman.
R. C. Cram, Brooklyn, N. Y., sponsor.
M. J. Curtin, Boston, Mass.
J. L. Fritsch, Pittsburgh, Pa.
W. H. Fulweiler, Philadelphia, Pa.
E. F. Hartman, New York, N. Y.
W. L. Harwood, Springfield, Mass.
E. L. Morier, New York, N. Y.
L. P. Scanlan, Newark, N. J.
C. A. Smith, Atlanta, Ga.
R. P. Woods, Kansas City, Mo.

Subjects and Meetings

A MEETING of the subjects and meetings committee was held in New York on Nov. 20, with the following members present: Chairman W. H. Sawyer, President Shannahan, T. C. Cherry, C. R. Ellicott, J. H. Hanna, Harry L. Brown, J. W. Colton, H. C. Clark, and Secretary J. W. Welsh.

The nature of the morning, afternoon and evening sessions for the Midyear Meeting at Washington were outlined and speakers considered. It was the general consensus that a forum discussion would be highly desirable and a portion of both morning and afternoon sessions will be set aside for this purpose. Certain subjects will be suggested for these discussions—subjects on which it is likely that a difference of opinion will exist—so that the delegates will be inspired to express their views and thus tend to bring out some worth-while points of view for the benefit of the members.

The next meeting will be on Dec. 19 in New York.

Special Trackwork Committee

THE A.E.S.C. sectional committee on specifications for special trackwork met at New York on Nov. 24. Those present were V. Angerer, chairman; R. C. Cram, H. H. George, C. A. Alden, E. B. Entwisle, G. L. Fowler, C. L. Hawkins, R. E. Hess, E. P. Rounder, E. M. T. Ryder, J. B. Strong, and G. C. Hecker.

Specifications for special track were discussed and the form of report to be made was considered.

News of Other Associations

Public Relations Discussed at West Virginia Convention

Water Power and Regulation Were Other Topics at a Two-Day Meeting of the West Virginia Public Utilities Association, Held in Charleston on Nov. 14-15.

WATER-POWER problems and the difficulties of the street railway and telephone companies were discussed at the seventh annual convention of the West Virginia Public Utilities Association, which was held at Charleston Nov. 14 and 15. It was attended by 120 utility executives. The convention lasted two days, the first day's session ending with a banquet, while on the afternoon of the second day the delegates attended the annual football clash between West Virginia and Washington and Lee.

Officers elected were: President, Mentor Hetzer, vice-president and general manager Moundsville Water Company; first vice-president, W. R. Power, manager Consolidated Heat, Light & Power Company, Huntington; second vice-president, J. E. Harsh, vice-president Virginia Power Company, Charleston; third vice-president, J. D. Whittemore, general manager Monongahela-West Penn Public Service Corporation, Fairmont; secretary, A. Bliss McCrum, Charleston; treasurer, A. M. Hill, Charleston.

D. I. McCahill, general counsel West Penn System, said it was an accepted fact that public service could best be rendered by a company, and that the investments of public service companies should be protected against wasteful competition. No monopoly was necessary, but "fly-by-night" opposition was taboo. He said that it was also recognized that unfair regulation of these companies would be more unfair to the public, which would suffer because of the lack of investment in the company and hence the curtailment of the service.

"Unless companies are allowed to prosper sufficiently to attract capital the public will suffer," he said. "That is why a liberal policy has always been the desire of public service corporations and reasonable rates have been assured the public. This policy stabilizes business and enables the utilities to give the utmost service.

"But every utility must have a publicity bureau to let its works be known. The troubles of utilities are nearly always because of misunderstandings with the public, because they do not know how to express themselves. The legislatures are made up of patrons of the public utilities. If the public utilities have not taken their patrons into their confidence or won their good will, they can never expect legislatures that will understand their works. The public utilities must tell the whole truth to the public and the newspapers are the only mediums."

In extending cordial welcome to the delegates Mayor Wertz said, among other things: "When I was a lawyer I was nothing loath to begin suits against the cold-blooded corporations. In those years you couldn't reason with public utility officials. It was simply a case of smacking down the papers in court. Today when such a suit threatens it is only necessary to call up the utility company at fault and every effort is made to redress the misfortune. It is because you have human officials and the human idea in business, and let me assure you that the public appreciates that spirit."

John B. Garden of Wheeling, manager Wheeling Electric Company, said Wheeling was the fourth city in the United States to have electric cars in operation. He traced the early advent of power into Wheeling, which was the first stand of the electric utilities, and said that it was by no means a rosy road to success.

A talk on "Electric Railways of Today" was delivered by R. P. Stevens, president Republic Railway & Light Company of New York, who said that the street railways of America have an investment in this country of $5,000,000,000 and carry 15,000,000,000 passengers annually. He said that such an investment and service would never be surpassed and that any talk of bus service superseding the railways was already known to be of the idle myth variety.

"Our problems are of today and not of yesterday," he said. He explained the "come-back" of the railways following the World War. Prior to that time too many companies were ready to sit silent and let the demagog threaten. The public got thinking that where there was so much smoke there must be fire and judged the amount of fire by the uncontradicted accusations. It became difficult for the companies to do business, and in their frantic zeal to stay in the game they cut fares to secure new extensions and leases, and then the government's statisticians found that the companies were really trying to operate while losing money. Then came the reaction.

For a time while this reaction to a sane level was in progress, there developed a second cloud in the form of bus transportation, he said. But every city in the United States of more than 50,000 population that had tried bus service exclusively has asked the street railways to come back. However, the companies are finding more and more success by using buses as auxiliaries.

Mr. Stevens said the municipal ownership failures that could be cited were legion. The people knew of all these and the one-time clamor had subsided. Independent control of the railways or supervision by a public utility commission safeguarded the public, and where roads were under such supervision they usually were popular, he said. He advocated a step further, pointing out that if government control wasn't desired, neither was ownership of utilities by a few men. He advocated customer ownership and pointed out that the public wants to buy such stock. He said that 25 offerings of 21 companies, aggregating $75,000,000, had been gobbled up by investors who knew that their money was safe.

A. Bliss McCrum, executive secretary of the association, briefly reviewed the work of the body since its formation on Sept. 16, 1915. He explained that the association was a clearing house for ideas of the same business of the whole world. New ideas, from whatever source, were passed on to the members, and in turn any suggestions from the members would be appreciated.

James Weir, field secretary of the West Virginia Publishers and Employing Printers' Association, said that the public utilities must advertise to tell of their service. He told about some companies whose excellent service is absolutely unappreciated, because the public has not been kept informed. This is because the companies are short-sighted enough to think that advertising is an expense instead of an investment. However, if companies advertise and then do not follow up with good servive, that advertising is futile. But, the speaker said, the growth of service among public utilities has been such that the public has ceased criticising, even though the reason might not always be understood.

Efficient Bus Lighting[*]

By L. C. Porter and A. C. Roy

Commercial Engineering Department, General Electric Company, Harrison, N. J.

A GENERAL survey of bus lighting conditions as they existed in 1923 indicated that the average bus contained: (1) Six inefficient inclosed dome fixtures, generally badly in need of cleaning and usually with one inoperative, due to a burnt-out or missing lamp; (2) 2 or 4-cp. lamps of inferior quality in the dome fixtures; (3) medium color finish on walls and ceiling; (4) wire of sizes too small to carry the lighting load without excessive drop in voltage, and (5) battery of inadequate capacity.

After analyzing the data that had been collected, tests were made in a motor bus body and results showed that sufficient light must be provided to insure the safety of the passengers upon entering or leaving the bus. Elderly people, ladies and those carrying babies require much more light than the younger or more active persons. To prevent eyestrain in case the passengers chose to read, more illumination must be provided in buses than is found in trolley cars because of the more intense vibration and subjection to jolts with the subsequent shifting of print. To secure the maximum value from the ad cards plenty of light is required. As an aid in creating the "riding habit" the interior should present a cheerful and inviting atmosphere. In order to care for all of these points an intensity of about 7 foot-candles upon the reading plane is necessary. Under ideal conditions 1 watt per square foot of floor space will give approximately 4.7 foot-candles of illumination. To secure 7 foot-candles of illumination in a 21-ft. body it is necessary to provide 1.5 watts per square foot or a total of 178.5 watts.

Of the lamps available the 21-cp. gas-filled Mazda lamp is to be preferred. The 6-8-volt 21-cp. lamp consumes 17.84 watts, while the 12-16-volt lamp consumes 16.82 watts. The number of lamps required is 10.

As the incandescent filaments of lamps have a high brilliancy, it is necessary, in producing comfortable illumination, that the eye be shielded from this source. Reflectors serve to obscure the filament or diffuse the light, so that it is not directly visible from usual visual angles. As a means of protecting the lamp bulb from breakage, a reflector is also of great assistance.

Light-directing fixtures for motor coach lighting may be classed as (1) Reflector units or those made of glass and open at the bottom, and (2) Dome units in which the lamp is totally inclosed.

Since the question of proper maintenance is a vital factor in good lighting practice, it is desirable to consider these questions: Is it of a shape that will tend to collect dirt? Does it have a metal reflector that will tarnish with age? Are there deep crevices which will be difficult to clean? Are the surfaces roughened and hence dust catchers requiring scrubbing to be made clean? Are there many parts to remove in order to clean the glassware properly and replace the lamps? Do these parts fit easily or are they held in place by small screws, clips, or other devices requiring considerable "juggling"? Are the fixtures constructed so as to withstand the severe vibration to which they will be subjected?

Number and Arrangement of Ceiling Outlets. The number and arrangement of ceiling outlets is governed primarily by the hanging height, i.e., the distance from the floor to the ceiling. The headroom in the average bus is seldom over 6 ft. 3 in. If reflector fixtures are installed the distance from the floor to the lower edge of the fixture will be less than 6 ft. Tall passengers will undoubtedly strike their heads on them. With fixtures that are placed up in the roof and flush with the ceiling there is still a very undesirable condition that cannot be overcome with fixtures in the central position. Standing passengers cut off the light that normally should reach the seats and the entire lighting plan is defeated. If, however, there were a headroom of 7 ft. as is found in trolley cars the central fixture would be more suitable. Lamps placed in two rows with each row from 12 to 15 in. from the side of the bus is by far the most desirable arrangement. Here, the reflectors will be out of the way of the standing passengers or those entering or leaving the bus, and the light will not be hindered from reaching the reading plane about the seats.

To insure an even distribution of light the fixtures should be placed from 3 to 3½ ft. apart. The last fixture should be placed about 1½ ft. from the rear wall and the others spaced accordingly. In general, the following number of ceiling outlets should be provided in the bodies listed:

Length of Body	Number Ceiling Outlets	Minimum Candle-power of Lamps
16 ft. to 18 ft.	6	21
18 ft. to 20 ft.	8	21
20 ft. to 22 ft.	10	21

No matter how carefully designed a lighting system may be as to type and size of lamps, type and make of reflector, spacing, height, etc., if the surroundings are not adapted to reflecting such light as strikes them, an inefficient system may result. The question of proper painting of walls and ceilings is therefore of great importance.

The results of tests of the effect of color of walls and ceilings made in a motor bus are listed in the following table:

INCREASE IN FOOT-CANDLE INTENSITIES PER CENT

	Dark Ceiling Dark Walls	White Ceiling Dark Walls	White Ceiling Light Walls
Eight bare lamps......	Std. 0.0	71.0	.....
Eight dome units......	58.0	61.0	71.0
Eight reflector units...	84.0	110.0	132.0

Lamps of 21-cp. were employed in each of these tests. For the same expenditure of energy the per cent increase in foot-candle intensities is clearly shown. Assuming eight bare lamps as a basis of comparison in a bus having dark oak walls and ceiling an increase of 84 per cent in intensity may be obtained simply by placing reflectors over the lamps. By painting the ceiling glossy white and the walls light oak and using reflectors over the same eight lamps the intensity may be increased 132 per cent.

Step Lighting — Step lighting on motor buses has never been really adequate but the need for such lighting is clearly evident from the safety aspect. Passengers frequently get off a bus facing the rear. It is hard enough to regain one's balance in broad daylight if the bus should give a start, but at night with no light to see by it is still more difficult. As a consequence passengers hang onto the grip or hand rail longer when getting off. This is particularly noticeable in inclement weather. When getting on a dark step of a bus there is a natural pause.

These things were observed and studied in detail, and actual stop-watch checks were made of the time required to take on and discharge passengers on various runs in the city of Newark. These tests showed that the time taken to get on a bus which had no step light was 11.4 per cent greater than where a good step light was used. Also it was found that 14.8 per cent longer time was required to get off from an unlighted step. With respect to poorly lighted buses, it would appear that in the course of an evening's run, considerable time could be saved by the bus operator if he had his bus equipped with a good step light. Certainly for the sake of safety and convenience to his passengers he should provide this.

---

[*] Abstract of paper presented before the New York section of the Illuminating Engineering Society, Nov. 13, 1924.

While much has been said regarding the standardization of higher voltages it would appear, after considerable study of the matter, that the 12-volt system embodies most of the points necessary for successful operation as far as the lighting is concerned. It is doubted if buses will ever be constructed to seat more than 70 or 75 people. A double-deck bus of this capacity would require the following number and sizes of lamps:

	Candle-power	Amperes
LOWER DECK		
Nine ceiling	21	10.44
Two headlights	21	2.32
Two platform	21	2.32
One dash	2	0.19
One rear	2	0.19
Three destination	2	0.57
UPPER DECK		
Ten ceiling	21	11.60
One platform	21	1.16
Two danger signals	21	2.32
One periscope	21	1.16
Total lighting load		32.27
Buzzers, stop light, etc., intermittent load		1.00
		33.27

Reduced to watts this is 33.27 × 14.5 = 482.4 watts. The 600-watt generator, which is in standard production at the present time, would amply take care of 483 watts, lighting and buzzer load and have 117 watts excess power. This amount of power will light seven additional 21-cp. lamps. Starting loads have been neglected, for the total number of ampere-hours required is very small.

The subject of voltage drop is very serious. On a 110-volt circuit 1 or 2 volts drop means only 1 or 2 per cent drop, but where only 6 volts are used, as in buses, 1 volt amounts to 16⅔ per cent. The effect of decreased voltages upon the candle-power output of both the 6 and 12-volt, 21-cp. Mazda lamps is as follows:

Voltage at Lamp Socket	Candle-Power Output of Lamp
6-8 Volt Lamps	
7.00	23.0
6.50	21.0
6.25	19.3
6.00	15.5
5.75	13.8
5.50	11.5
5.25	9.2
5.00	7.8
12-16 Volt Lamps	
15.0	23.0
14.5	21.0
14.0	19.3
13.5	16.8
13.0	14.7
12.5	12.6
12.0	10.5

The average jitney was wired with No. 16 stranded wire. A recommended list of wire sizes follows:

Size American Wire Gage	Aera Circular-Mils	Current* Capacity in Amperes Rubber Insulation
14	4.110	0–5
12	6.530	6–8
10	10.400	9–15
8	16.500	16–24
6	26.300	25–30

*The ampere-capacity range given in the table above is suggested in order to reduce the voltage drop throughout the lighting circuit to a minimum.

WIRING FOR 21-FT. BUS BODY HAVING 8 to 10 21-C.P. CEILING LAMPS

Points of Connection	Size of Stranded Wire 6 Volts	12 Volts
Battery to ground	6	8
Battery to ammeter	6	8
Ammeter to switch busbar	6	8
Switch throughout circuit	10	12
Connections to lamp sockets	14	14
Common return to ground	6	8

Lamp Sockets—With the application of miniature lamps to automobile service, it was found that the screw bases originally in use worked loose in the sockets due to vibration. The bayonet base was introduced to overcome this objection and provide the positive positioning of the light source required in headlights and spotlights. The lamps are based with the pins at right angles to the plane of the filament. The single-contact bayonet socket has now been standardized by practically all manufacturers because of economy in wiring, lower voltage drop, simplified socket construction; and other mechanical and electrical advantages.

The total ampere drain on the storage battery exclusive of starting is shown in the following table.

Continuous Lighting Load	Candle-power	Total Amperes 6 Volts	12 Volts
Two headlight lamps	21	5.62	2.32
One rear lamp	2	0.47	0.19
One dash lamp	2	0.47	0.19
One gen. indicating lamp	2	0.47	0.19
One fare box lamp	2	0.47	0.19
One step light lamp	21	2.81	1.16
Ten ceiling lamps	21	28.10	11.60
Total continuous lighting load		38.41	15.84

Other Intermittent Operating Devices	Candle-power	Total Amperes 6 Volts	12 Volt
One stop light telltale	2	0.47	0.19
One stop light	21	2.81	1.16
Buzzers	..	....	....
Total intermittent load in amperes		3.28	1.35

Assuming that on continuous discharge the intermittent load as given would amount to 2 amp. at 6 volts or 1 amp. at 12 volts the total load on the generator would be 40.41 amp. for the 6-volt system or 16.84 amp. for the 12-volt system. The starting load would amount to considerably less than 1 amp.-hr. and so it has been neglected in these computations.

It is recommended that a battery of such size as will carry the entire lighting load for from 6 to 8 hours with the generator idle be selected. This is particularly desirable where the bus is operating on short runs with long layovers. Choosing the mean of 7 hours and multiplying this by the number of amperes required the ampere-hour capacity of the required battery is 280 amp.-hr. and 119 amp.-hr. respectively for the 6 and 12-volt systems.

In summarizing, the following is recommended as the best practice in motor bus lighting.

1. That 21-cp. Mazda C lamps be used in the ceiling fixtures.
2. That 21-cp. Mazda C lamps be used in the step light.
3. The single contact bayonet base case of the type recommended be accepted as standard.
4. Two types of lamps be standardized, viz.: 2 and 21-cp.
5. Reflector fixtures be employed foi the ceiling lights.
6. The ceiling be painted gloss white.
7. Six ceiling lamps of 21 cp. be used in bodies 16 to 18 ft. long; eight ceiling lamps of 21 cp. be used in bodies 18 to 20 ft. long; 10 ceiling lamps of 21 cp. be used in bodies 20 to 22 ft. long.
8. Ceiling outlets be arranged on two circuits and be placed on the ceiling 12 to 15 in. from the side walls.
9. Wire of the recommended sizes be employed throughout.
10. All wire joints to be soldered.
11. Battery and ground connections be made as outlined.
12. Switches of ample size be installed.
13. All lighting circuits fused.
14. A suitable switch and fuse panel be adopted.
15. A battery of sufficient capacity to carry the lamp load for from 6 to 8 hours exclusive of generator be provided.
16. The generator be of ample capacity to keep battery charged.
17. Voltage regulation be provided.
18. The 12-volt system be standardized.

New England Club Meeting

THE December meeting of the New England Street Railway Club will be held at the Copley Plaza Hotel, Boston, Mass., on Dec. 4. The afternoon meeting, which will be called to order at 4 o'clock, will be devoted to a paper on "Maintenance Costs of Car Equipment," by Henry S. Day of the Westinghouse Electric & Manufacturing Company.

Two papers will be read at the evening meeting: "Maintenance of Street Railway Personnel," by S. F. Fannon, director division of public service, Sherman Service, Inc., Boston; and "Street Railway Economics," by T. N. Carver, professor of economics Harvard University.

Motor Freight Tariffs in C. E. R. A. Territory

AT THE last meeting of the Central Electric Traffic Association the committee on freight tariffs and rates agreed to secure information from the various states with regard to I. C. C. Cause No. 14,828. The committee reports:

> In Indiana the Public Service Commission has no jurisdiction over trucks and for that reason no tariffs can be filed in connection with trucking companies where they are made participating carriers. The only way this can be handled is to consider any points reached by them as a station on the line of the railroad which issues the tariff and operates in connection with the truck line.
>
> In Michigan it is entirely legal for any line to start this service provided a permit is first obtained from the Michigan Public Utilities Commission, and there is nothing in the law tending to restrict joint service between electric lines and truck lines.
>
> In Ohio the truck companies are under the jurisdiction of the Public Utilities Commission and joint tariffs may be filed covering service in both directions in connection with them.

City Fares in Northern and Central Europe*

The Use of Flat and Zone Fares Is Fairly Equal—In Addition There Is General Use of Special Rates for Workmen and Wholesale Riders, Either with Individual Ride or Season Tickets

By August Winter
Vienna Municipal Railway

Owing to the catastrophic fall in German exchange during the year 1923, this paper can present only a fraction of the conclusions which would otherwise have been possible with regard to the influence of different fare systems. Furthermore, the results which are presented require subdivision because of the unequal influence of the World War on the economic status of members in Germany, the neutral states (viz., Norway, Sweden, Denmark, Holland and Switzerland) and in the Austro-Hungarian succession states. The subdivision as to population follows:

CLASSIFICATION OF STREET RAILWAYS REPLYING TO FARE QUESTIONS

Number of Cities of: Population	Germany	Neutral States	Succession States	Total
Over 1,000,000	2	..	1	3
700,000-800,000	1	1	..	2
600,000-700,000	2	1	..	3
500,000-600,000	2	.	..	2
400,000-500,000	3	..	..	3
300,000-400,000	3	1	..	4
200,000-300,000	2	2	..	4
100,000-200,000	6	5	3	14
Under 100,000	3	5	4	12
Total........	24	15	8	47

Of the reporting properties 30, or 64 per cent, are municipally owned; 11 properties, or 23 per cent, are owned entirely by private capital; and in the case of the remaining six properties, or 13 per cent, the city is the controlling shareholder to the extent of at least 50 per cent.

Three-fourths of the reporting street railways handle all the mass transport of their cities except for a little steam traffic. Competition is of account only in 12 cities, and outside of Berlin and Hamburg rarely amounts to more than 25 per cent of the total traffic. In Germany's largest two cities the subdivision of traffic is as follows:

	Berlin	Hamburg
Street railways ...	51.68	40.1
Steam railroads (electrified at Hamburg)........	32.6	43.2
Elevated........	12.47	15.7
Buses........	3.25	0.31
Boats........	......	0.65

Vienna is unique in that its nearly 2,000,000 inhabitants have no rapid transit, so that the street railways carry about 95 per cent of the traffic. While a rapid transit system was laid out just before the war, the nearest approach to rapid transit is the coming electrification of the old steam Stadtbahn, which has been leased by the government to the city of Vienna. This railway is 38.8 km. (24 miles) long. Its layout is unfavorable for rapid transit, but it did carry about 40,000,000 passengers (8 per cent of the total traffic) a year up to the time of its shutdown on Dec. 8, 1918.

Flat and Zone-Fare Systems

A tabulation of fare systems shows that of the 47 undertakings, 22 had unit fares and 25 some form of distance fare. In Germany the proportion was as 10: 14; in the neutral states as 11: 4; in the succession states as 1: 7.

The totals show that the unit and zone-fare systems are fairly equal in number. The effectiveness of one or the other most depend upon local conditions and on the degree to which the public has become accustomed to either. In general, the unit fare preponderates in northern Europe and the zone fare in central Europe, as in Switzerland and the succession states. Berlin is on a flat-fare basis, while Hamburg favors distance fares. [Editors' Note—The original Berlin franchises called for a 10-pfennig fare in the city proper and 15-pfennig fares on the western suburban routes.]

Proportion that Fare Bears to Wages

The most desirable measure of the relative highness of fares in different communities appears to be the ratio of the fare to the weekly earnings of an average workman. If F is taken to represent the average fare and W the weekly wage the following table appears for the value $\frac{F}{W}$:

Cities	$F \div W$ in Ten-thousandths
Scandinavian........	20 to 25
Dutch........	24 to 29
Swiss........	15 to 23
Succession states........	30 to 38

German cities have been omitted from the foregoing table because the economic situation was too unsettled at the time this paper was prepared. In any event, the proportion for them is believed to be greater in most cases than in those included.

Another relation is the annual expenditure for fare compared to the local weekly wage. Let n represent the number of rides per annum. Then the annual expenditure will be "$F \times n$". The relationship to the weekly wage W is given by the equation $x = \frac{Fn}{W}$. As the value of $\frac{F}{W}$ for any given group of cities has already been determined as a constant K, we can write our equation as

$$x = Kn$$

We know, of course, that the number of rides ("n") per inhabitant per annum tends to increase with increase of population and area. Taking Vienna as an example, we have:

$F = 1370$ Kroner.
$W = 630{,}000$ Kroner.
$n = 285$.

Then

$$x = \frac{Fn}{W} = 0.62$$

Eliminating the German cities, it is found that the value of x in the smaller cities is 0.16 to 0.20; and in the larger cities, 0.5 to 0.6. In certain German cities, x attains as high a value as 0.8. This value brings the annual expenditure per inhabitant in comparison to the weekly wage up to the limits usually found only in world cities such as London. For example, Lord Ashfield in the June, 1921, *Nineteenth Century and After*, figured that a typical London family of five persons spend £16 a year, or four weekly wage payments, for transport. This amount corresponds to the value $x = 0.8$, since 0.8 multiplied by 5 (persons) = 4 (weekly wages). In Vienna, the value of 0.62 multiplied by 5 (persons) = 3.1 (weekly wages); but in some months of 1922 and 1923 the limit of 4 was attained.

Most of the undertakings reported that different rates of fare were charged according to time of day. About one-fifth of the properties (chiefly in the neutral states) sell individual reduced-rate rides for workmen; but all of the others except five cities have a substitute for this in the form of weekly cards or similar wholesale purchase concessions. The workmen's rates are usually valid up to times varying between 7:30 a.m. and 8:45 a.m. The reduction ranges from 30 to 50 per cent.

Limited-ride weekly cards are most common in German cities but season tickets, punch cards, tear-off coupons or ticket books are used in individual cases. One undertaking sells a workman's card which is valid during the morning hours to 8 o'clock; between 12 noon and 2 p.m.; and between 5 and 7 p.m. Another railway runs special workmen's cars from 3 a.m. onward at a reduction of 25 per cent. Only one property has departed from the peak-hour, reduced-rate custom by granting a lower rate between 9 and 12 a.m. when traffic needs most encouragement.

Higher fares for night hours begin, in some cases, as early is 7 p.m., but the usual hours are 9 to 10 p.m. with a few choosing an hour or two later. The night fare is generally one and one-half to two times the ordinary fares. In the case of after-midnight or owl service, there are seven properties which charge double to triple the ordinary rates. A detail tabulation follows:

PER CENT FARE DIFFERENTIALS ACCORDING TO HOURS AND HOLIDAYS

	Number of Railways	Reduction — or Increase +
Early morning........	10	30 to 50—
Late forenoon........	1	37—
Late evening........	19	14 to 100+
Owl........	7	20 to 230+
Round trip........	3	25 to 50—
Sundays and holidays........	2	21 to 25—
	5	46 to 100+

---

*Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

Individual round-trip tickets (sold at 28 per cent reduction) are used in but one city. On two other properties, the holder of a transfer costing nothing to 50 per cent more is at liberty to return or to take a second ride at any time during the day.

It will be noted that seven systems have a different fare on Sundays and holidays, two making a reduction and five an increase in the rates. In some cases, the rate on holiday afternoons is double that of the morning, but not higher than the standard weekday fares.

On 31 properties transfers are free; on eight they cost 20 to 50 per cent more and on five they are not granted at all. The rules vary greatly as to the permissible number of car changes. A check at Vienna of season ticket or pass users revealed a transfer ratio of 80 per cent as follows:

20 per cent used no transfers.
46.7 per cent transferred once.
24.5 per cent transferred twice.
7.3 per cent transferred thrice.
1.5 per cent transferred four times.

In other cities, the transfer ratio is generally 25 to 30 per cent, with some cities below this range and others as high as 50 per cent. [EDITORS' NOTE—The transfer indentifications as described in the paper are similiar to those of American practice.] In a few cases the time limits are good for two hours or even for the entire day.

Children are carried free up to ages varying from two to six years or, in some instances, if they are not more than 1 m. (39.4 in.) tall. Most railways grant a concession to children up to twelve or fourteen years of age or, in some cases, if they are not more than 1.3 m. (51.2 in.) tall. The average reduction is 50 per cent, with some as low as 25 per cent and one as high as 88 per cent.

Three cities charge foreigners double to triple the standard rates.

A standard fare is the customary extra charge for parcels, only four undertakings charging by dimensions and three by weight. Twenty-three out of 33 which answered this question made no charge for small parcels. Twenty-five charged for large parcels and one carried them free with the understanding that the motorman would receive a tip. Large parcels are carried on the front platform.

Lap dogs are generally carried free, but sometimes a children's or a standard fare is exacted. Large dogs must ride on the front platform.

PREPAY TICKETS BECAUSE OF PAPER MONEY

Following the eliminatioon of metal money up to 80 per cent of the properties came to sell prepayment tickets to avoid the bother of paper money. The reduction for these prepaid fares averages 25 per cent; and the proportion of prepaid riders from 30 to 40 per cent. Swiss properties make use of both ticket books and punch cards. The books contain 18 to 33 (occasionally 50) individual tickets sold at reductions of 16 to 30 per cent. All but 10 of the German roads sell books of 10 tickets ordinarily and in other cases of five, six, 12 or 25 tickets. In but one case are these books non-transferable and usable only with the purchaser's photograph. These German books are sold at cuts of 7 to 20 per cent and they bring 15 to 25 per cent of the rides.

Of cities with more than 1,000,000 inhabitants, Vienna offers the only example of an important ratio of prepaid tickets. It has 21 varieties to account for 25 per cent of the traffic. The reduction ranges from 6 to 10 per cent for adults; and to 50 per cent for children.

Nine properties use punch cards and a still smaller number use tear-off coupons. Five properties issue paper tickets, but these are sold without any reduction in rate.

Four of the northern properties are using fare boxes and two of these also have automatic change-makers. Fare receipts are issued in many varieties with or without commercial advertising. On 15 properties in Germany, the fare receipts bear a simplified routing plan which is helpful to both passenger and conductor.

Almost all properties provide their conductors with punches and money satchels; with blue pencils for cancellation of receipts, transfers and tickets and with boxes for carrying the latter, etc. Practices concerning use of cancellation punch, tear-off and blue pencil vary greatly. Conductors are charged out daily with the value of tickets taken and they must make daily reports; but final settlement in most cases is made monthly, except on the smallest properties where daily settlements are the rule.

WEEKLY CARDS AND SEASON TICKETS SHOW WIDE DIVERSITY

Weekly cards and season tickets for periods ranging from half a month to a year are sold on all but nine properties. The weekly cards are for either 12 or 24 trips, such numbers as 13 and 14 being exceptional. Only 13 properties impose a non-transferability rule and of these but three require photographs of the original buyer. These weekly cards are usually limited to given routes and times of day. Exceptions include a weekly card which permits one ride on six successive Sundays. Weekly cards for students are sold at reductions up to 50 per cent.

As regards season tickets or passes there is a wide diversity in the extent to which they are used by the owners. It is assumed that a system-pass buyer will ride 100 to 200 times a month, and in some cases, 250 to 300 times. A traffic check made in Vienna during 1923 showed that the monthly cards were used about 200 times a month. [This includes the 80 per cent transfer ratio previously mentioned by the author.—EDS.] Individual route cards varied in use from 100 to 150 rides a month to a maximum of 210. The same habits are predicated of semi-annual and annual cards, but few are sold for such long periods. As transferable passes are assumed to have more use than personal passes, they cost 50 to 100 per cent more. Swiss properties sell passes on the basis of a decreasing charge for successive months within the same year.

To avoid the uncertainty of unlimited-ride transportation, some railways sell season tickets limited to two or four rides a day, which makes them similar to punch cards.

The popularity of the weekly cards and season tickets is shown by the fact that they account for 18 to 27 per cent of the rides in the large cities and 44 per cent of the rides in the other cities. The weekly cards secure about two-thirds of this wholesale traffic, attaining in some cases to 30 per cent of all traffic in a given community. In the metropolitan cities, the weekly cards account for only 3.5 to 8.5 per cent of the traffic. The proportion of system to individual route cards is as 2:3.

A comparison of the year 1923 with 1913 shows that most railways are doing a bigger share of their business with these wholesaling plans than in the past. In Vienna the increase has been fourfold, due chiefly to the inauguration of such cards for shorthaul riding. The latter type of cards in themselves account for 11 per cent of the traffic. Many cities have doubled their use of these cards and a few have trebled.

Season tickets are almost always non-transferable, and of the non-transferable type, 49 per cent must bear the buyer's photograph. The cards are renewed from month to month by means of stamps or, where no photographs are used, by purchase of entirely new cards. Season tickets are generally good on all days of the week; otherwise some increment is charged for Sunday all day or afternoon riding. They are sold at special reductions to employees of the public services, students, war cripples, blind, feebleminded, etc.

NUMBER OF PASSENGERS PER CONDUCTOR

From the author's researches, the number of passengers per conductor employed seems to average one per 105,000 passengers per annum. Only eight of the reporting properties used secret service in addition to the uniformed inspectors. On 15 properties, the ride-stealing passenger may be fined twice to ten times the standard fare.

The economic disturbances caused by the World War are shown at their worst in Germany where there were some 64 changes in rates, 30 to 40 of which occurred during the year 1923. During 1924, the gold standard mark (Rentenmark) was restored, and to date two to three reductions, amounting to 20 to 25 per cent, have usually been made in fares—sometimes three to five reductions. The succession states have had fewer variations in fares from pre-war days, viz., seven to 28. Vienna has had 22 changes in fares since 1913 of which nine came in 1922, when it was possible to make reductions of 5.9 per cent and 6.3 per cent.

The standard base fare in Germany before the war was 10 pfennigs (2½ cents). The present base fare on the gold standard is usually 15 pfennigs (3⅝ cents). Sometimes, the base fare is now figured on one instead of two initial sections or on a shortened initial section. Some properties charge double the original fare but have lengthened the ride for the base fare. In the neutral countries, present fares are 1.6 to 2 times the pre-war rates, and in one case they are 2.33 times as much.

These increases in fare were necessitated by increases in materials and wages. Befor the war, wages amounted to 40 per cent of total expenses; during the war and after, to 70 per cent and more. In the neutral states, the ratio of wage increase to fare increase was as 1.7-2.3 to 1; and in the succession states as 1.6-2.2 to 1.

The only thing that enabled some undertakings to continue business under these conditions was that the density of traffic was raised in proportions like the following:

Cities	Passengers per Car—Kilometer 1913	Passengers per Car—Kilometer 1923
Scandinavian.......	3.4—4.5	3.3—7.5
Dutch.............	4.0—4.3	3.6—5.3*
Swiss.............	3.9—5.2	3.9—6.0
Succession states....	2.1—3.9	3.4—4.9

* Year 1924

During the worst period of the exchange situation, 47 German street railways ceased operation. Nineteen of these were restored by May, 1924.

CONCLUSIONS

The changes which have occurred since 1913 have not been confined entirely to fares, although the tremendous upheaval caused by the war led to much experimentation back and forth—zone properties trying unit fares and vice versa. It is significant that in most cases the original system was restored, although compared with 1913 there seems to be a small increase in the number of unit fare systems.

Equipment and Possibilities of One-Man Cars[*]

More Than Half the Operators Use One-Man Cars—The Amsterdam Design Has Electro-Mechanical Safety Devices and, Like Malmo, Uses Passenger Stop-Light Instead of Bell or Buzzer Signals

BY T. EGBERT VAN PUTTEN AND EINAR HULTMAN
Amsterdam, Holland Malmö, Sweden

AFTER reviewing the course of one-man car development in the United States, the authors state that the consequences of the World War did not permit Europeans to follow with the same broad use of automatic equipment. The majority of one-man cars were simply the original vehicles with one man less and with entrance and exit (usually) at the front platform only. The delays so caused were not relished by the public nor did the operators themselves show enthusiasm for a system that increased their labors.

Nevertheless, the economies of one-man operation have been so great, even in the crudest installations, that every effort must be made to overcome these difficulties. This is obvious when one considers that on 55 properties which replied to the questionnaire and which operate very largely with two-man cars, the cost of platform labor averages 36 per cent of the income and 41 per cent of the outgo.

In view of this, it is desirable to introduce one-man operation gradually on many systems and, where possible, increase the service so that the rate of personnel reduction will not exceed the normal proportion of resignations. The authors of the paper, in submitting replies to the questions following, note that as conditions are rapidly changing, the answers received some time ago might be modified now.

Out of 57 replies to the question, "Do you believe that the increasing competition of motor buses will influence one-man car operation, aside from the general financial troubles now prevailing?" 35 were negative, 10 positive and 12 were either in doubt or considered the problem did not touch them. The authors state that owing to the large increase in motor-bus competition during the preceding year, a round robin at this time might prove more instructive. They believe that the motor bus now run in part as one-man vehicles, can become a very serious competitor. The buses are allowed to operate under more favorable conditions, notably in having no responsibility for paving expense; and in not being as yet subject to the stringent regulations concerning labor, upkeep, etc., that have been the lot of street railways for decades. A number of bus installations have shown far less reliability and continuity of service than the older rail lines, but some are operated on almost as high standards as the tramways. While municipal authorities may be persuaded to limit parasitical competition, it is the duty of the existing transport undertaking to operate motor buses where necessary and to take fullest advantage of one-man car opportunities.

Out of 58 undertakings operating or contemplating the use of one-man cars, 25 had complete or partial installation, two gave up such operation, 14 intend it. The remaining 17 are not contemplating such cars. In most cases, the change has been made merely by blocking off the rear platform. In one instance, where operation is two-man in the city and one-man in the suburbs, a detachable door is carried on the car for addition and removal on the rear platform. In another instance, exit but not entrance is permitted on an unguarded rear platform.

Safety appliances are considered necessary on rebuilt cars by 17 out of 41 undertakings, while 21 do not and three favor them to a limited degree.

Out of 41 managements, six believe in the deadman's handle, 29 do not and six think such a controller desirable although not absolutely necessary. One argument is that a safety device not practicable on the trackless bus surely cannot be considered essential to a vehicle bound to a definite path.

Door and step control by the car operator, whether manual, electric or pneumatic, is favored by 18 out of 38 properties replying. Another 18 do not favor them and two are in doubt as to which is most practicable. The 18 which favor door and step control are divided as to the merits of manual, electric or air operation.

Out of 38 replies, 15 consider it necessary to have distinct entrance and exit aisles. Of these, 14 would even use a barrier. Eighteen are against separation and 19 against barriers. Five see some usefulness in separation during rush hours.

As to the feasibility of having entrance at the front and exit at the rear with possible provision against entrance at the rear, of 36 managements, 14 say it is and 18 deny this, while four consider it difficult because of the small amount of supervision. To avoid loss of time from conflicting streams of passengers, it is suggested that during rush hours rebuilt cars might be operated with rear gates and eventually with rear doors under control of the car operator.

A mirror is considered practicable in case of rear-platform operation by 20 out of 36 replies, while 14 do not consider it practicable and two are without a definite opinion.

Doors opening automatically in emergencies are favored by only one in 38 replies, although all the others said that as a matter of course the doors, gates, etc., should be arranged for easy opening by the passengers.

Out of 37 undertakings, 11 favor a passenger-operated emergency brake with cords or levers, although one observes that an emergency connection of this kind is needless with deadman's control; 24 do not favor this and two are in doubt. The authors point out that unnecessary application of the emergency brake may cause damage. They suggest that a circuit-breaking connection might serve on properties in level country, leaving some passenger to manipulate the regular hand brake. However, it would be generally desirable to have some form of emergency connection which would both cut off power and operate the brakes.

Vestibuled platforms are felt to be a necessity on one-man cars by 30 out of 39 replies and unnecessary be nine, although some of the latter admit that vestibuling might prove advantageous. The authors favor vestibuling because this permits the removal of body doors and bulkheads to facilitate passenger movement and because a man handling paper money and receipts needs protection against drafts.

Out of 38 replies, five favor a seat for the operator, 27 do not and six are in doubt. There is a division of opinion as to where the seat should be placed. The authors suggest some type that can be moved when it is embarrassing to the operator.

---

[*] Abstract of a paper before the Internationaler Strassenbahn und Kleinbahn Verein, Homburg von der Höhe, September, 1924.

Of 33 replies, 19 favor bulkheads and some even consider them a necessity. Eleven regard bulkheads as superfluous and three merely report that their present cars are so built. Those which consider bulkheads a necessity have platforms varying from 1 to 2 m. (39 to 78 in.) length. Most replies hold a minimum of 1.3 m. (51 in.) is required. The authors observe that the removal of the bulkhead is of advantage in enabling the operator to announce the stops more readily and to be more watchful.

Out of 34 replies to the question, "If you were buying new cars would you favor the American idea of full automatic equipment?" eight favor safety car standards, 17 do not and nine would recommend only a portion of the devices. The authors in commenting on the replies feel that a plan which brings such great economies but which demands so much more from the platform man ought to enjoy at least some protection against overcrowding so that the time for stops could be kept within limits. Furthermore, the greater maintenance expense will absorb but a fraction of the savings with improved one-man cars.

The answers to three questions regarding type and size of one-man cars favored were very diverse. Some believed that one-man operation should be confined to cars up to 30 passengers, but others held that it was possible with cars of 50 to 60-passenger capacity. Separate exit and entrance would be favored even on the small cars, while the larger type might consider entrance at the front and exit at the rear. If all interchange is at the front, the dividing line might be carried into the carbody for a length of 1.5 m. (59 in.). The authors suggest that one-man cars up to 50 seats are feasible on systems operating with unit fares, while other systems must be guided by the character of their fare tariffs.

Four out of 36 say "No" to the question, "Would you continue to give fare receipts, especially if you added fare boxes?" three are in doubt and the remainder say "Yes." The last consider such control absolutely necessary, or at least for transfer passengers. The replies developed that some undertakings are operating one-man cars payleave. Only a few managements had any experience with fare boxes.

Of 38 replies, 12 have a flat-fare system, 23 have not and three say they use flat fares only in part. It is admitted that the flat fare is undoubtedly the most advantageous for one-man operation, but that the difficulties with zone fares are not so great as might be supposed because it is just in the rush hours that many passengers ride on passes or season tickets which, of course, lightens the operator's work quite materially.

Of 35 managements, 14 consider one man operation practicable with zone fares and transfer privileges, nine do not, and 12 believe that it is limited to lines with light traffic. The authors comment that the extent to which such operation is possible depends upon local conditions and the co-operation of the platform men and the public. It is suggested that punching or other marking of receipts, transfers, etc., should be avoided in the course of a trip and that every effort should be made to do this at the terminals. It should also be made easier for the operator to issue receipts as passengers board.

Reduced-rate prepaid tokens or tickets are considered desirable by 18 of 35 managements; eight do not and nine are in doubt. It is observed that if no fare box is used, the fare receipts for cut-rate tickets would have to be special.

Retention of the passenger's bell signal was favored by 24 out of 35 replies, partly because it is so widely used now and partly because an acoustic indication is considered better than a light indication. Three favor light with the bell in reserve and three either have no choice or consider a verbal demand good enough.

Trail cars with one-man motor cars was felt to be practicable by 21 out of 33 managements, while 12 are of the contrary opinion. There seems to be no choice between bell and light signals, but the authors believe the latter will probably become more common.

Out of 36 replies, 17 would pay a premium to one-man operators and 17 would not. The increase varies from 1 to 15 per cent, but the majority think 10 per cent right. The authors judge that an increase is justified in those cases where one-man operation has to be introduced gradually with some provision toward giving a share of the benefits to the personnel to secure their interest.

The replies varied greatly as to prohibition of smoking, but some permitted smoking on the rear platform at any rate. The authors state that special roof ventilators are expected to help in the question of better ventilation.

The advantages of one-man cars in the opinions of the operators are summarized as platform saving, better schedules at the same cost and fewer accidents.

The disadvantages are delays in heavy service, slower schedule speeds, more stolen rides and draftier cars. Some replies suggested that delays in standing time could be made up by faster running time.

ONE-MAN CARS AT AMSTERDAM

Following the questionnaire and replies thereto, the authors presented details of the modernized one-man cars which have been installed under Mr. Van Putten at Amsterdam and Mr. Hultman at Malmö. The latter was fully described in ELECTRIC RAILWAY JOURNAL, for Feb. 9, 1924.

As only a brief description of the Amsterdam car appeared in ELECTRIC RAILWAY JOURNAL for April 12, 1924, it may be well to mention its outstanding features. Mr. Van Putten, after visiting the United States was convinced that anything but real safety car operation was unthinkable for Amsterdam. He was unable, however, to use the then standard Birney type because the cars were too light, there was only one door for entrance and exit and the automatic equipment was air-operated. He therefore prepared specifications for a larger and heavier design with double-door platforms. Five such cars were built by the Linke-Hofmann Works, Breslau, and fitted with the Bergmann Electric Company's one-man devices. These cars operate on a one-fare route with the comparatively high traffic density of 15 passengers per car-kilometer (a kilometer = 0.62 mile).

The special features of these cars include the following:

The "in" and "out" doors are controlled electro-mechanically by the operator, separately or in tandem.

The doors and folding steps work in unison.

The draft rigging with trailer operation has shock absorbers to avoid injury to riders when starting.

The car cannot start before the doors are closed.

The emergency opening of a door opens the power circuit.

Short-circuiting brakes are used, but part of the energy is shunted to two magnetic track brakes which show red signal lights on the bulkhead while in circuit.

Release of the deadman's control handle cuts off the motor circuit but sends current to the track brakes. The deadman's device can be made inoperative by a pedal when the seated operator is using both hands for fare collection and the like.

One ½-hp. 220-volt roof-mounted motor per platform cares for door operation. These motors have functioned successfully for two years in a daily service exceeding 200 opening and closing movements.

Another feature is the use of an illuminated fare box with coin-tilting table.

Because of the success with new cars, 15 old ones have been fitted with some of the same devices. As space limitations did not permit separate entrance and exit via the front platform, these cars are operated front-entrance and rear exit. Unauthorized rear entrance hitherto has been prevented by a three-arm turnstile. The older cars have no deadman's handle or track brakes.

Mirrors give the operator a view of the rear platform.

To reduce car noises, the passengers' push button does not actuate a bell or buzzer but closes a line-voltage circuit which causes a red lamp to light alongside the operator.

In general, these cars eliminate step accidents and do not delay passenger interchange owing to separate aisles for entrance and exit.

The standard 10-cent fare is dropped into a box. No receipts were issued during the turnstile period.

Smoking is permitted on the rear platform.

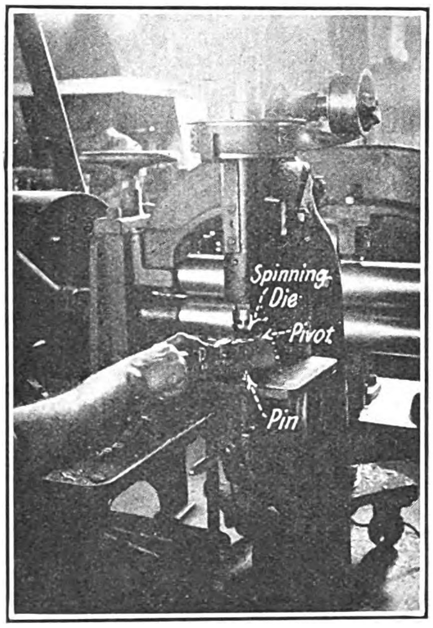
The reconstruction cost of the cars did not exceed 5,000 guilders ($2,010) per car while the platform labor saving alone is 7,000 guilders ($2,814) a year. The service was increased about one-sixth to permit an equal number of riders to be carried during the rush hours. The net annual saving on twelve cars is 50,000 guilders ($20,100) a year.

Because of an accident in which a two-man car was derailed with its front end hanging over a canal, agitation was begun against one-man cars with rear platform turnstiles. As a result, the City Council ordered the removal of the stiles. This will necessitate a return to fare receipts which are to be issued by machine.

Maintenance of Equipment

Spinning Rivets on Controller Fingers

WHEN a rivet is driven by ordinary methods through a number of thin laminated pieces of material, it is difficult to make sure the several pieces are pulled down tightly against each other when the rivet head is formed. This condition is encountered in riveting together the laminations of controller cylinder fingers.



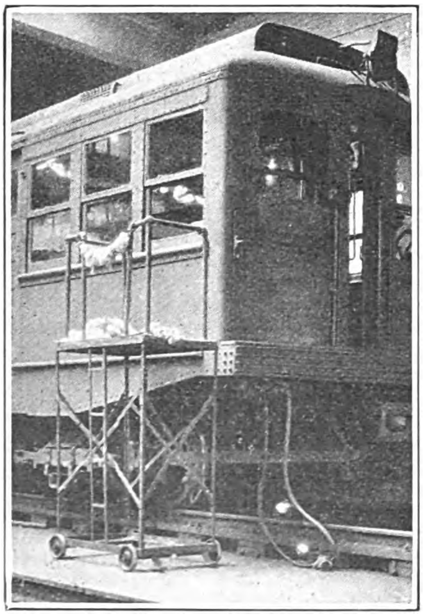
A Rivet Spinning Machine in the Twin City Rapid Transit Company's Shop Has Been Found to Do Very Good Work in Riveting Controller Fingers

The mechanical department of the Twin City Rapid Transit Company has found a rivet spinning machine to be very useful for doing such work. Not only is the production equal to or greater than can be obtained by driving the rivets, but the spinning method has been found to give a much better job. There is no tendency for the shank of the rivet to swell between the laminations, as is the case with a driven rivet.

The die shown in the head of the machine in the illustration is a common commercial type of rivet spinning die. The various parts of the controller fingers are assembled in the jig shown, which is fastened to the bed of the machine. This jig pivots about a point at the back end. The operator grasps the handle on the jig, holding the parts in place with his finger, as shown. He then swings the jig over so that the rivet comes into position under the spinning head. A pin in the bed of the machine, shown in the illustration, can be depressed so as to allow the jig to swing under the spinning head, and upon being released this pin engages a hole in the bottom of the jig, so as to hold it in exactly the right position. The head of the machine is depressed by means of a foot lever manipulated by the operator. The rivet head is formed very quickly, giving an unusually smooth, well-formed job.

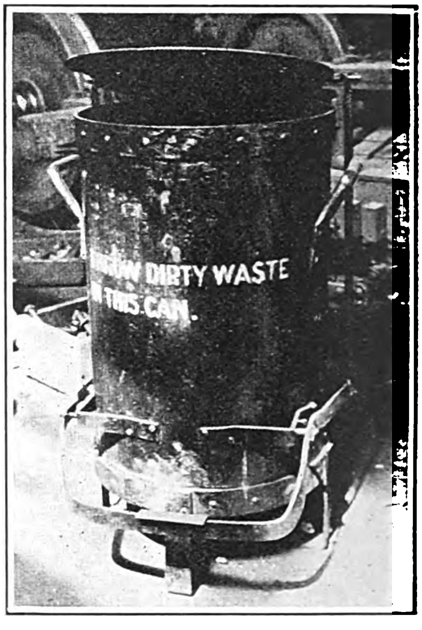
Car Cleaners Use Self-Propelled Carriage

TO AVOID the necessity of the car cleaner climbing up and down a ladder and moving it from place to place when wiping the outside of a car and washing the windows, an easily movable carriage has been developed by the Boston Elevated Railway. This is a simple framework made of iron piping and placed on four small iron wheels. The car cleaner stands on the platform, which is so arranged as to height that he can wipe the entire side of the car from top to bottom for as wide an area as his arms can reach. After he has done this he grasps the car body firmly and rolls the carriage to a new position. It is thought by the company that this device has more than doubled the efficiency of the men cleaning car exteriors. It is being used in all the shops and carhouses of the company where there is a concrete floor on which to operate the carriage.



Easily Movable Carriage Which Has Doubled the Efficiency of the Exterior Car Cleaners

Self-Closing Waste Can



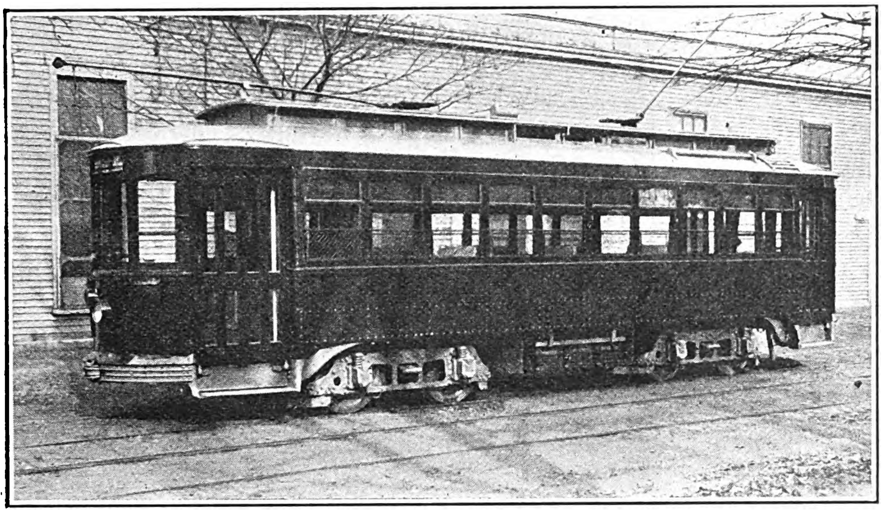
This Type of Waste Can Has Foot Control of Hinged Cover

REALIZING that good housekeeping is one of the most important elements of fire prevention, cleanliness has been promoted in the Wheaton shops of the Chicago, Aurora & Elgin Railroad by the use of improved waste cans. By the device installed there the problem of keeping the waste in the can and the lid shut was solved successfully. The can, of the usual 30-gal. sheet-iron variety, was provided with legs, and a heavy lid hinged at one point so arranged that it can be opened by means of a foot treadle. The four legs are made up of 1½-in. x ¼-in. steel bars bent to the proper form and riveted to the side and bottom of the can. About 6 in. from the bottom of the can, two pieces of 1-in. x ¼-in. steel bar, bent to form a right angle, were riveted to the side of the can. These form a support for the fulcrum of the simple lever which extends from the foot treadle in front to the connecting rods located on each side of the can. These rods connect with projections fastened on the lid and serve as a means of transmitting the motion of the lower lever to the can top. With this arrangement it is possible to step on the treadle at the front and cause the lid to rise. The foot lever is made up of ¼-in. x 1-in. material, the connecting rods of ½-in. round steel and the projections on the lid are of ½-in. round iron forged out flat on one end in order that it may be riveted to the lid. The lid is held shut by its own weight. On each side of the can is a handle located in a convenient position for carrying.

The outfit is painted black, and the instruction "Throw Dirty Waste In This Can" is stenciled on it in yellow paint. Several of these cans are located about the shop and have proved a means of keeping the shop clean.

Simplified Color Scheme Aids Spray Painting

IN ORDER to reduce the expense of car painting, in so far as it is possible to do so without seriously detracting from the appearance of its vehicles, the Eastern Massachusetts Street Railway has reduced the number of exterior colors to two. The entire body is painted yellow, while gray is used for the roof, trucks and the other equipment under the car. No striping or lettering is done except the placing of a number in the center of the side.



The Cost of Car Painting Has Been Reduced by the Use of a Simplified Color Scheme Without Striping or Lettering

Two exterior colors are applied by means of a De Vilbis spray painting machine. The window guards, which are black, are painted by a dipping process. Windows are left in place during the painting process and are protected by a coating of Preservit. After the painting has been completed, this coating is removed and takes with it all paint which may have spattered onto the glass.

Spray painting is used also inside the cars for the floors and sides. The headlining and the ceiling on the platform, which are white, are painted by hand. Such small equipment as may be located inside the car is also hand painted.

In order to encourage riding by keeping the rolling stock clean and fresh looking, each car is painted once every 14 months. It is said that the use of the color scheme here described and the spray painting process has cut in half the cost of car painting.

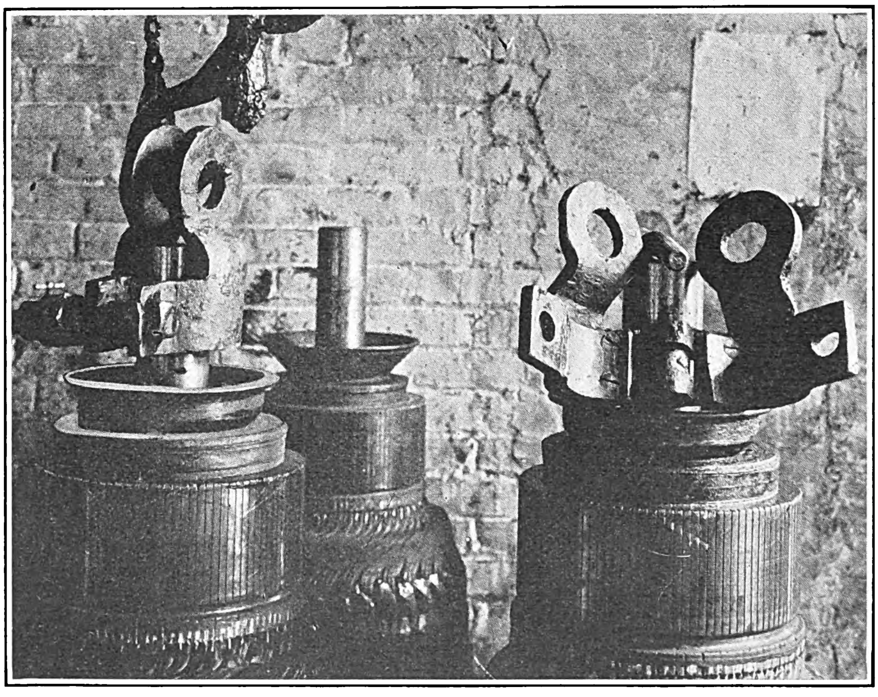
Clamp Holds Armatures in Vertical Position

By R. S. Neal

Assistant Superintendent of Equipment, Kansas City Railways

IN THE shops of the Kansas City Railways it has been found advantageous to handle armatures in a vertical position during the operation of dipping and baking. They are dipped with the pinion end down, and are baked in the same position, to avoid excess flow of varnish to one side, as would be the case if they were drained or baked horizontally.

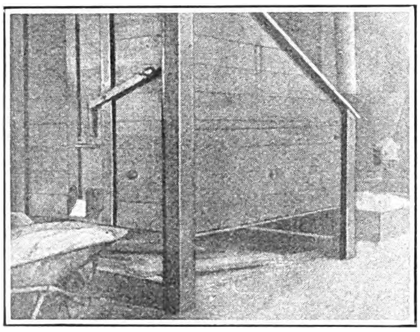
The type of clamp shown in the accompanying illustration, while of simple construction, has proved handy and safe for lifting and moving armatures about by the commutator end of the shaft. This clamp is shown in both the closed and open positions. It consists of two forgings hinged together at one side, while the other side is held together with a bolt which pulls the clamp tight on the shaft and holds it securely. The inside faces of the clamp that come in contact with the shaft are lined with soft copper to prevent any possibility of scoring it.



This Clamp Is Used at Kansas City to Handle Armatures in a Vertical Position for Dipping and Baking

Sand Storage Simply Arranged at Decatur

SAND for use on the interurban cars of the Illinois Traction System is stored in a simple wooden sand bin in the Decatur shops. The bin is 6 ft. high by 6 ft. long by 5 ft. wide and has a capacity of approximately 6 cu.yd. The sloping top contains a six-mesh, No. 14 wire screen, 5 ft. long by 4 ft. wide. A sliding metal door at the forward end, operated by means of a lever and link, closes a chute opening by means of which sand may be poured into a wheelbarrow. To the rear of the bin is located a No. 2 Viloco sand dryer of 1 cu.yd. capacity, manufactured by the Vissering Company. After the sand has gone through the dryer it is shoveled onto the screen of the bin. The sloping top is thus of great convenience. This removes any foreign matter or large particles of sand which would be undesirable for use in the sand box on the cars. Sand is drawn off into a wheelbarrow as needed. The simplicity in the construction of the bin and the lineup of the various parts of the apparauts are the outstanding features of the arrangement.



Sand Storage Bin of 6 Cu.Yd. Capacity Has Screen Sloping Top Through Which Sand Is Screened After Removal from Stove Type Sand Dryer

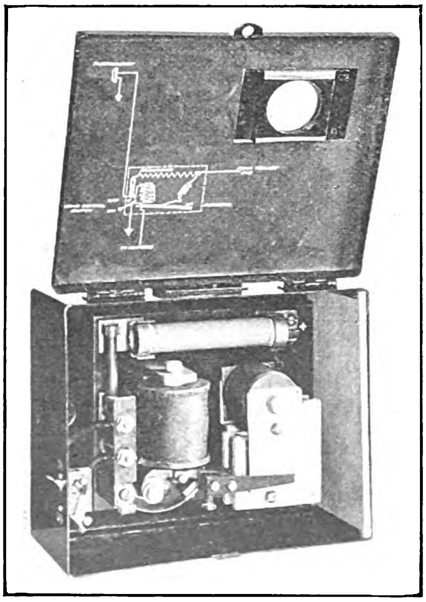
New Equipment Available

Developments in Thermostatic Control

By LEE P. HYNES

Consulting Engineer Consolidated Car Heating Company, Albany, N. Y.

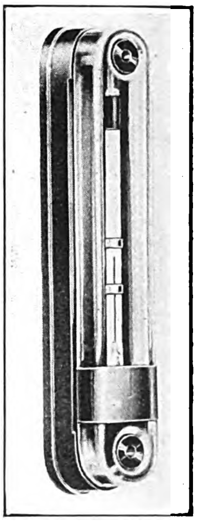
IN THE first thermostatic control equipments much of the sensitiveness of the thermometer was lost through the metal casing and also through the retarding effect of the car walls. Crews found that without fear of detection they could break the thermometer and keep the heat on continuously, by pressing on the metal case sufficiently to crush the glass tube.



Improved Main Switch for Thermostat Control

A molded glass cover instead of a metal cover has provided a satisfactory solution of the trouble and is used in the Consolidated Car Heating Company's thermostat of the latest type as shown in an accompanying illustration. A back plate of molded insulation keeps the car wall from affecting the operation and provides insulation for the electrical connections. The molded glass cover is mounted on this base with a yielding cushion, covering the mercury tube, which is also mounted in yielding supports to take up any shocks or jars. The glass cover has no openings, as temperature changes are more readily carried to the mercury by direct conduction through a thin strip of copper. This is folded around the outside of the glass case, looped under its edges and clamped around the mercury bulb. This strip is insulated from actual contact with the cover. The glass cover must be smashed before anyone can tamper with the thermostat and the mercury tube is clearly visible.

Improvements have also been made in the main magnetic switch controlled by the thermostat. . Early mercury thermostats were unable to handle much current. Sparking on the contact points oxidized the mercury and ruined the tube. The new equipment includes simply a main switch having an operating magnet, a blowout coil, a series resistance and a fuse for the thermometer circuit. It has no relays, no auxiliary circuits nor contacts, no shunt resistances such as were used with previous equipments. The mercury simply shunts the magnet coil and by a correct design and balance of current values, there is no overloading of the mercury contacts. Three new convenient features have been added to the equipment: (1) An indicator visible through a glass window in the switch box shows whether the switch is open or closed; (2) A small control switch on the side of the box permits the conductor to throw the heat control off or on at will; (3) An opening in the side of the box allows easy inspection and cleaning of contacts.



Visible Mercury Thermostat With Molded Glass Cover

When the small switch in the "off" position, the main switch opens and keeps the heat off until the switch is reset to "on." When the control switch is thrown to the "on" position, it throws the thermostat into control. If heat is needed, it will be turned on, but the thermostat cannot be prevented from shutting off the heat when the car attains the desired temperature.

In the new design an inspector can see at a glance the position of the mercury column, owing to the glass thermostat cover, and also the position of the main switch through the glass window in the switch box. The switch box cover can be locked if desired and need only be unlocked for replacement of a fuse or inspection of contactor tips. The opening in the side of the box for inspection of the contacts is closed by a transite liner.

When the box cover is open, the transite wall shown at the right in the illustration can be pulled out and the contacts inspected or cleaned through the end opening in the box without removing the arc chute.

The News of the Industry

Springfield Franchise Passed

Voters of Illinois City Pass Ordinance Giving Rights to Railway for Twenty Years

An extension of its street railway franchise was obtained by the Illinois Power Company in Springfield at the election on Nov. 4. The majority in favor of the proposal was 2,500. More than 26,000 votes were cast. The extension is for 20 years, the time limit in Illinois. The existing grant of the company does not expire until 1928, but the approach of the expiration date made it difficult for the company to plan ahead satisfactorily and to arrange the best terms for future financing.

Proposal Rejected in the Spring

Early in the spring a franchise proposal was submitted to the City Council and approved by the members of that body, but when the matter went before the voters in April it was defeated by a small majority. At the spring election, just as at the later one, the principal dissenting voice to the company's proposal was raised by Commissioner Willis J. Spaulding. Mr. Spaulding operates a municipal electric light and power plant at Springfield and is president of the Municipal Ownership League of America. If the matter were left to him he would municipalize the entire transportation system of Springfield. He is also a motor bus enthusiast and professes to see the day ahead when street railways in cities of the size of Springfield, some 60,000, will disappear. In order to bolster up this profession he told only parts of the story with respect to the use of the bus in Bay City, Saginaw, Decatur, St. Louis and other cities. He dangled in the faces of the voters of Springfield the prophecy that a complete, new, modern bus system could be installed and operated successfully on a 5-cent fare either by the city or a private concern for $500,000 and provide "much better and cheaper service" than that supplied by the railway.

One Dissenting City Commissioner

The Mayor and the three other commissioners answered Mr. Spaulding's strictures effectively. It is impossible here to recite all the points that they made. Their principal reasons for favoring the franchise were summarized by the commissioners and kept constantly before the public. As they saw it the ordinance does these things:

Protects all the rights of the people, including the right of purchase by the city, at fair value when the city is ready to buy.

Compels adequate transportation service to be furnished.

Requires the company to pay approximately a half million dollars into the city treasury for use of streets during the life of the franchise.

Requires the company to pay the expense of paving between its tracks and 1 ft. outside of rails, thereby insuring no interruption of the city's great improvement program.

Does not in any way interfere with the use of streets for buses and other means of public travel. The franchise is confined to street car travel only. The city is free at any time to decide as to future plans relating to other means of transportation.

The Springfield company has not been slow to take up the bus. It is now operating five vehicles in service coordinated with its railway lines. The company also conducts the electric, gas and steam heating services in the city and supplies electric service to DeKalb and Sycamore. The present fare is 7 cents cash with four tickets for 25 cents and 40, 50 and 60-ride monthly tickets to be sold for $2, $2.50 and $3 respectively.

Extension of Time Likely for Improvement of Yonkers Lines

Admission has been made by Assemblyman Alexander H. Garnjost of Yonkers, representative of the Fourth Assembly District, Westchester County, that the New York Central Railroad Company cannot be expected to fulfill the requirements of his electrification bill. This bill was adopted at the last session of the State Legislature and provided for the electrification of the Getty Square branch and main line of the Putnam Division within the Yonkers city limits by Jan. 1, 1926.

Assemblyman Garnjost says he will offer an amendment to his bill at the next Legislature granting the New York Central Railroad a time extension for the improvement of its Putnam lines in Yonkers.

The railroad has been working out the plans and specifications necessary for the improvement, but there are several reasons why the road could not be electrified by Jan. 1, 1926. Principal among these is the fact that all grade crossings must first be eliminated, in accordance with a recent state law. Another reason is the unavoidable delay which the railroad must face in securing steel for the various bridges which must be reconditioned.

Assemblyman Garnjost, after explaining these reasons, said the railroad must show "good faith" in its plans for the electrification of the Yonkers sections of the Putnam Division, i.e., must either make known its plans or commence the work, before he will offer an amendment to his bill granting the New York Central the necessary time extension.

George W. Kittredge, chief engineer of the New York Central, has estimated the cost of improving the Getty Square branch at $2,000,000 and of the main line at $4,000,000. The plans have not yet been approved by the Public Service Commission.

Buses for Detroit

Emergency Bus Lines Being Run There by Department of Street Railways as Municipal Enterprise

The Detroit Department of Street Railways does not own any buses, but one bus line is being operated by the city and another is to be put into operation. As soon as the buses are delivered that the city intends to purchase three lines will be established. The equipment in use on the Belle Isle line is owned by the Department of Parks and Boulevards. Bus service is being started on the Eight Mile Road, west of Woodward Avenue. The buses will run from the Eight Mile Road and Livernois Avenue district to the Highland Park plant of the Ford Motor Company. The route will cover approximately 5 miles in territory not now served by any kind of transportation. The seven buses to be used will be rented from the Detroit Motorbus Company.

As indicated by the desire of the commission to purchase additional bus equipment the new services just mentioned are only a beginning. The Street Railway Department has made extensive plans for bus service, including the conversion of the Kercheval-Concord carhouse into a modern bus terminal. It is proposed to use the terminal to house the buses on the Belle Isle line and the buses for the proposed Mack-Warren bus line. It is planned to care for the street cars now housed in the carhouse at the yards at St. Jean and Kercheval Avenue.

The rate of fare to be charged on the Eight Mile Road bus line has not been announced. The department will guarantee the bus company the cost of operation, but the line will be operated without profit to the department. It has been announced by the D. S. R. management that the fare will not exceed 10 cents, a charge which will be reduced as patronage of the line increases.

Three buses were supplied by the Detroit Motorbus Company when the D. S. R. was constructing the new Mount Elliott line, which has just been put into service. The new railway serves as a feeder to the Gratiot Avenue line and comprises 2 miles of new track beginning at Gratiot and McDougall Avenue. At Mount Elliot Avenue a spur track runs to the rear of the Dodge plant. Cars enter through a subway into a prepayment station similar to the one in use at the Ford plant at River Rouge.

The Street Railway Department recently placed posters in the cars stating that operation of the bus service depended upon the action taken by the Council. The posters show pictures of the double-deck buses which the commission has recommended for use.

Retail Merchants Want Cars

Discussion Between Mayor Hylan and President Huff of the Third Avenue Railway, New York, Broadcasted

Retail merchants on Forty-second Street and 125th Street, New York, bitterly oppose any plan to remove the crosstown tracks in those streets, as suggested by Mayor Hylan. They declare that such action would prove a great loss to their business, and they are decidedly against any suggestion for the substitution of buses for cars. The Third Avenue Railway has a pile of letters to this effect. They are the result of a brief canvass made by the company following a letter it received on Nov. 13 from Mayor Hylan. This letter, which was addressed to President S. W. Huff, said, in part:

> Why do you send your people about getting petitions signed to continue a public nuisance? You realize that cars running in the middle of the street, as they do on Forty-second Street and 125th Street, as well as other streets in the city, are a menace to the lives of the people in boarding and leaving these cars.
>
> You do not seem to realize that buses will replace these surface lines. At least you should be alive to the situation and make some progressive move yourself.
>
> Some of the people who have signed these petitions and written letters I understand have expressed themselves in favor of buses.
>
> The New York Railways realizes that buses will take the place of their surface lines and has made a request to the Board of Estimate and Apportionment to this end, and no doubt the board will give serious consideration to same.

On the day the letter was received a quick canvass was taken of the opinions of the retail merchants affected, and these testimonials, with a letter from President Huff, were transmitted to the Mayor on Nov. 14. The correspondence, with quotations from some of the letters from the merchants, was then made the subject of a radio talk Nov. 14 from the Third Avenue broadcasting station at Third Avenue and 130th St. A portion of Mr. Huff's letter to the Mayor follows:

> Some of the more than 200 people who wrote personal letters opposing the removal of tracks on Forty-second Street and on 125th Street may have expressed themselves in favor of buses at other locations, but their letters undoubtedly expressed their wishes with regard to the street upon which their business is located, and they are emphatic against the removal of track from these streets.
>
> Passengers in boarding cars away from the sidewalk expose themselves to no more risk, if as much, than they do in crossing streets. The records show that there have been comparatively few accidents from this source, and when once on the cars passengers are practically immune from accident by reason of the stability of the car and its freedom from danger to which buses are exposed.
>
> You are correct in your statement that I do not seem to realize that buses will replace these surface lines. It is hard to realize a mere theory when you are confronted with facts that contradict it. The fact is that buses have not supplanted trolley cars to any substantial extent where the travel is sufficient to justify trolley car operation, and that where attempts have been made so to supplant car operation the business interests have suffered to such an extent that street car service had to be resumed. There may be developments in the future which may justify the substitution of buses for trolley cars. If so, it is purely an economic question and will solve itself, but there is nothing at the present time that would indicate such substitution will take place.
>
> With regard to the proposal of the New York Railways to remove its tracks and substitute buses, I think you will be able to judge better just what this means if you were to ascertain which tracks they are proposing to remove. The companies of the Third Avenue Railway System have, by regular proceedings, abandoned and for the most part removed during the last 5 or 6 years in the territory occupied by the New York Railways, approximately 27 miles of trackage for the reason that the operation over this trackage no longer served any large public purpose or was justified financially. During this period the New York Railways, although it had discontinued operation of a substantial amount of trackage, has not legally abandoned this trackage by reason of being in the hands of a receiver. When you have finally ascertained just what trackage that company is proposing to abandon, I doubt very much whether you will find that the New York Railways proposes to abandon any substantial portion of its trackage that is now being operated.
>
> I wonder, Mr. Mayor, whether you couldn't find the time in the near future to talk this thing through with me. We are both trying to serve the same people, to ascertain their wishes and to do that which is best for them. Something might be gained by a free discussion of this matter. Will you see me?

Studies made by the Third Avenue Railway of the passengers and vehicles passing certain points in congested districts indicate the disproportionately large amount of street space per passenger carried taken by motor vehicles as compared with that taken by trolley cars. Below will be found a table of studies in congestion made during the early part of this year. Studies of this kind are being continued by the company.

STUDIES IN CONGESTION

		Total Passengers	Total Vehicles	Passenger per Vehicle	Square Feet Street Space per Passenger Carried
Count 1—	Cars	3,373	84	40	8
	Autos	829	437	1.9	43
Count 2—	Cars	14,031	500	28	13
	Autos	4,948	2,546	1.9	42
Count 3—	Cars	9,875	264	37.4	8.95
	Autos	10,559	5,287	2	40.5
Count 4—	Cars	2,487	39	64	5.6
	Autos	2,438	877	2.75	28.7
Count 5—	Cars	993	20	50	7.1
	Autos	314	218	1.4	55.2
Count 6—	Cars	5,590	138	41	8.7
	Autos	2,598	1,779	1.5	35.4
Count 7—	Cars	1,500	77	19.5	20
	Autos	4,615	2,436	1.9	43

Count 1 was made at Forty-second street and Broadway Jan. 17, 1924, 5 to 6 p.m., westbound.

Count 2 was made at Forty-second Street and Broadway, Jan. 17, 1924, 12 to 8 p.m., westbound.

Count 3 was made at Broadway and Fiftieth Street, Jan. 23, 1924, 12 to 8 p.m., northbound.

Count 4 was made at Broadway and Fiftieth Street, Jan. 23, 1924, 5 to 6 p.m., northbound.

Count 5 was made at Broadway and Hudson Street, Yonkers, Jan. 7, 1924, 5 to 6 p.m., northbound.

Count 6 was made at Broadway and Hudson Street, Yonkers, Jan. 7, 1924, 12 to 8 p.m., northbound.

Count 7 was made at North Avenue and Burling Lane, New Rochelle, Jan. 19, 1924, 12 to 8 p.m., northbound.

New York City Must Answer $30,000,000 Charge

Under a decision rendered by the United States Circuit Court of Appeals on Nov. 20 the city of New York must answer a charge made by Lindley M. Garrison, former receiver of the New York Municipal Railroad Corporation and allied companies, now included in the B.-M. T., that the city caused damages approximating $30,000,000 to the railway corporations. The suit begun by Mr. Garrison charged that under an agreement made in 1913 the municipal authorities failed to carry out certain plans for the extension of the transit system to which they were committed.

Judge John C. Knox recently granted an order requiring the city to answer this complaint and corporation Counsel George T. Nicholson took an appeal to the Circuit Court of Appeals.

Report Delays Settlement

Citizens' Committee Insists on 7½-Cent Fare in Cincinnati—Directors Call Negotiations Off

Insistence upon an absolute and unconditional guarantee of a 7½-cent rate of fare for the first three years of the traction franchise by the citizens' committee in a report to Mayor Carrel threatens to undo at the eleventh hour the work of the conferees in the electric railway negotiations with the city of Cincinnati, the Cincinnati Street Railway, the Cincinnati Traction Company and the public. The result may be a continuance of a 10-cent rate of fare, if not a further increase, after Jan. 1. The directors of the Cincinnati Street Railway in a formal statement issued on Nov. 22 absolutely decline to accept the recommendations of the citizens' committee and insist that they will go no further with the present negotiations.

In its report to the Mayor, the citizens' committee says in substance that "the ordinance as drafted is much superior to the present ordinance, that there was an agreement as to fundamentals and that the ordinance should be sent to the City Council for passage after it is modified to provide for an absolute guarantee of a 7½-cent rate of fare for the initial three-year period of the grant." It is this provision to which the directors of the Cincinnati Street Railway take exception.

Under the terms of the ordinance as drafted the new operating company, the Cincinnati Street Railway, proposes to rehabilitate the entire system and to improve the service. It will immediately create a fare control fund of $400,000 to insure stabilization of the rate of fare. If the operating expenses of the company exceed the income from fares, the company will be permitted to draw upon the fare control fund until it is down to $200,000 if necessary before any increase of fares will be permitted. There is an additional guarantee for the first three years of a low rate of fare, since the proposed ordinance provides that during that period the company must feed into the fare control fund one-sixth of the return allowed upon capital as soon as the fund goes below $400,000. So that under the terms of the grant, even before the fund is reduced to $200,000 the company is compelled to give up a part of its earnings in the interest of a low rate of fare. After that has been done and the fund is reduced to $200,000 an increase is then permitted. During the negotiations the company sought to modify that clause so that in the event of the granting of a higher wage to the platform men it would not be compelled to devote any of the return on capital to keep down fares. Upon the insistance of City Solicitor Saul Zielonka and Street Railroad Director W. J. Kuertz, however, that modification was not included in the grant.

The company's representatives, however, during all of the negotiations have refused to accept a clause that would guarantee unconditionally a 7½-cent rate of fare for the first three-year period.

Boston Mayor for Municipal Ownership

Mayor James M. Curley of Boston advocated before the special legislative committee on the finances and control of the Boston Elevated Railway that the Elevated should be taken over by the cities and towns in which it operates and the fares reduced to 5 cents. He would tax the communities for the deficit from operation. The committee heard the Mayor on Nov. 25.

Under the Mayor's plan the communities, constituting essentially the Metropolitan area, would take the Elevated by condemnation, after the property had been valued, and then manage the road by a board of public trustees, as at present. Mr. Curley says two of the trustees should be appointed by the Mayor of Boston and three by the Governor of Massachusetts. The Mayor contended that in regard to its importance to the public the railway should be considered a civic problem on a par with the schools, the water system or the sewerage system. High real estate values and proper conduct of business could be assured only if the railway received proper civic consideration. There are 500,000 private autos in Massachusetts and many bus lines, and it is the Mayor's idea that the car riders should no longer be required to support the electric railways. The Mayor figures that it would increase the taxes about $9,000,000 to make the railway a direct charge on the community, but Representative Henry L. Shattuck of the committee estimated that the tax increase would be nearer $14,000,000.

The committee is charged with the responsibility of recommending a policy with respect to the future operation of the Boston Elevated. It is expected to file its report by Dec. 15.

Bus Legislation Likely in Indiana

Utilities and bus operators are wondering what will happen at the session of the Indiana Legislature next January. It is significant to note that in the recent political campaign the successful candidate for Governor, while he stated that all unnecessary commissions should be abolished, did not specify just what commission he meant. This is considered by utility operators to mean that the administration will not look with favor on the abolition of the Public Service Commission.

On the other hand, the State Chamber of Commerce has launched a movement for a bus and truck regulatory law. It is planned to make a survey of the traffic needs of the entire state and present reports to the individual chambers of commerce and civic bodies in each city. They will be asked to study the reports and present suggestions to be condensed into a bill which will be introduced in the Legislature.

The question of bus regulation first came up two years ago at a meeting of the Assembly, but a movement to provide regulation was defeated. The development of bus transportation in the state has reached such huge proportions during the last two years that this question is most certain to come up again at the next session. In fact, officials of city and interurban railways are insistent that some sort of regulation be imposed on bus lines. The main contention at the last session on the part of bus men was against the form of the bill rather than on the principle of regulation. It would appear to be natural to seek to put the bus lines under the jurisdiction of the Public Service Commission, but members of the commission say they are overworked now and cannot assume additional responsibilities.

Objections to Pittsburgh Looping Will Be Heard

The City Council of Pittsburgh, Pa., recently voted to conduct hearings on request of objectors to the plan of the Pittsburgh Railways for rerouting downtown cars. The action was taken after the Council had been advised that a decision on the plan was a matter for the Traction Conference Board, and that the Council was not to be regarded as a factor in a rerouting plan. Much discussion has taken place since the company formulated its plan for short-looping in the business district. The main points in the plan were referred to in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 22. In talking to the Real Estate Board recently about traffic problems, Arthur W. Thompson, president of the Pittsburgh Railways, discussed the proposed changes in routing and the reduction in the size of the loop in the downtown district. He said that at the present time there was a crisis in congestion caused by the increased number of vehicles entering the area during the day—80,000 vehicles at the present time, not including the street cars. Mr. Thompson said that it was because of the lack of transportation facilities that people had been forced to a greater use of automobiles and that this was one of the very things which was bringing about a greater congestion and which the company was trying to remedy or temporarily relieve.

He referred to the routes which would be shortened and the few streets to be converted into one-way thoroughfares. It was proposed, he said, that the loops be extended on Sundays, holidays and in off-peak hours at night.

Passes Popular the First Week in Oklahoma City

Whether the weekly passes now sold by the Oklahoma Railway, Oklahoma City, Okla., giving unlimited riding on the street cars for $1.25 a week, will prove to be a sufficient booster for traffic to work the company's salvation in the crisis that has been growing more acute for several months, the pass is proving popular with some car riders. About 500 passes were sold during the first week. The records show that the average cost of each ride by holders of the weekly passes was 5.4 cents. The passes are transferable and are good on any street car at any time during the week for which they are sold for as long a ride as the holder cares to take. The company has an application pending with the Corporation Commission for a 10-cent fare, on which a hearing has been set for Dec. 5.

Fare Increase Imperative, Says Twin Cities Head

An oral hearing has been set for Dec. 1 before the Minnesota Railroad Commission, on the petition of the Twin City Rapid Transit Company for an increase from its 6-cent fare.

Horace Lowry, president of the company, recently stated that the present fare means confiscation of property, and that a 7-cent fare is absolutely necessary. The traffic decline on the line has been steady. In the first 10 calendar months of 1920, the peak year for Minneapolis and St. Paul, car passengers carried numbered 198,500,000, against 172,711,000 in the corresponding period for 1924. Mr. Lowry pointed out that in the summer of 1921 both the Minneapolis Street Railway and the St. Paul City Railway applied to the commission for valuation of property and fixing of a reasonable rate of fare. The commission granted a 7-cent fare, but both cities appealed and the courts reduced the fare to 6 cents on the ground that the state commission, not having yet valued the properties, could not reasonably fix a fare. Mr. Lowry said that expecting a value would soon be arrived at, the company continued to operate at the 6-cent fare for three years. He said the evidence of the company's financial condition has been filed with the commission.

Rights of Community Bus Line in Court

Although two court injunctions have been granted in Los Angeles, one on the application of the Pacific Electric Railway against the Community Donational Bus Line operating between the city of Los Angeles and the city of Venice, the operators of the free bus system have defied orders and continued operations. It was recently brought out that two days prior to the date of the issuance of the injunction the bus line was leased by the original owners to a Mr. Prole of Oakland, and under the name of the Merchants' Bus Service began operating under the Prole system. Mr. Prole, inventor of the Prole Transfer Coupon System, is running the buses by having the passengers buy coupons which are redeemable at stores in towns through which the buses operate.

After issuance of the first injunction, the Community Donational Bus Line appealed to the California Supreme Court to have the order of the Los Angeles Superior Court set aside, but the Supreme Court denied the defendants a writ of prohibition which would have prohibited the Los Angeles judge from enforcing the injunction, on the ground that the Superior Court had jurisdiction. After the buses were changed to the Merchants' Transfer Bus Line under the Prole system the operators were cited for contempt of court, being charged by the court with having violated the terms of the second injunction.

The bus line has also made application to the Railroad Commission for a permit to operate as a common carrier. The Prole or coupon system of buses is now operating while the matter is still in the higher courts for a decision.

Forfeiture Clause in Draft for Rockford Company

Mayor Herman Hallstrom of Rockford, Ill., has completed his draft of a franchise ordinance for the Rockford City Traction Company. This is in accordance with instructions in a resolution recently adopted by the City Council. The Mayor has sent copies of the draft to the railway officials and the Aldermen for their consideration. The Mayor said that the ordinance could be introduced as a substitute for the one now before the Aldermen.

It provides for a 20-year grant indorsed by referendum. The ordinance leaves the matter of the operation of motor buses subject to permits from the Council. The draft provides for assessing full cost of track paving against the street railway company, with permission for payments on the installment plan and for practically doubling the street improvement program for thoroughfares containing car tracks. The Mayor would abandon the plan for requiring a $750,000 cash bond to guarantee completion of promised improvements and would substitute a forfeiture clause that the franchise shall end if promised improvements are not made within the time specified in the ordinance. Opinions on the Mayor's draft differed widely.

Transit Talks Tell Tale of B.-M.T.

With the desire on its part to inform the patrons of its difficulties and problems, and at the same time to express its intention of doing everything it possibly can to help its patrons, the Brooklyn-Manhattan Transit Corporation, through its chairman, G. M. Dahl, has been carrying on a series of advertisements in the daily papers. These advertisements are called "Transit Letters." In the first one Mr. Dahl gives some facts about the Brooklyn-Manhattan Transit Corporation as to its passenger traffic, its wages expenses, its miles of "L" and subway lines, and the number of cars which serve its patrons. In subsequent letters the ownership and directorship of the B.-M. T. are discussed, and in a later letter Mr. Dahl tells what the stockholders and directors have done for the patrons of the company during the past year and a half since they have been responsible for the policies of the B.-M. T. He says that from the very start the public interest has been the chief interest which has controlled the company.

Fare Request Refused in Malden

The Malden City Council has refused the request of the trustees of the Boston Elevated Railway for the right to raise the fares in that city from 5 to 6 cents without a tranfer and to 10 cents with transfer. These rates were asked in accordance with a new fare schedule established by the elevated on other parts of the system.

The railway has been unable to put the increase in fares into effect in Malden owing to a clause in the franchise granted by the City Council permitting the company to run buses in that city, in which it stipulated that local fares shall not exceed 5 cents. The ruling has caused some confusion. The fare from Malden to Medford, for example, is 5 cents, while from Medford, which is under the new rate schedule, to Malden, the fare is 6 cents on strip tickets.

The Malden City Council has also adopted an order requiring the Boston Elevated in the future to advertise two weeks in advance any proposed substitution of buses for electric cars in Malden.

The City Council has empowered the Mayor to call a meeting of citizens to discuss the traffic system of the city and the petition of the Eastern Massachusetts Street Railway for permission to run buses from Malden Square to the Revere Line, and so complete the system to Revere Beach.

One-Man Car Operation Planned in Cleveland

The Cleveland Railway has announced its intention of using one-man cars during non-rush hours on a number of lines in Cleveland, Ohio, that have not been meeting operating expenses. The announcement has met with opposition from Councilmen. John J. Stanley, president of the company, insists, however, that only the courts can stop his company from using the one-man cars.

The company plans to start the use of one-man cars on Dec. 1. They will be run on the Clifton Boulevard line, and possibly on the Fairmont Boulevard line, between the hours of 9:20 a.m. and 3:50 p.m. and from 6:20 p.m. to 12:30 a.m.

Paul Wilson, secretary of the railway, says the company's plan to use one-man cars is an economy measure. He points out that the company asked for an increase of 2 cents a car-mile in its operating allowance to bring this allowance up to 28 cents a car-mile, but that so far the City Council has not acted on this request.

Immediately after the announcement by the company of its intention to run one-man cars, the Lakewood City Council, at a special meeting, passed an ordinance making it a misdemeanor to operate a car with a one-man crew. The Cleveland City Council also adopted a resolution instructing the City Street Railway Commissioner to refuse to authorize operation of one-man cars.

It is the general opinion in Cleveland that the right of the company to operate one-man cars will be threshed out in the courts.

The City Council on Nov. 24 also received resolutions authorizing the Cleveland Railway to operate bus lines on four main arteries leading to the westerly limits of the city from the Public Square. The bus fare would be 10 cents, with a 1-cent transfer charge to street cars and a 4-cent transfer charge from cars to buses.

Actual operation of buses by the railway will not be undertaken, however, until the Ohio State Supreme Court has decided whether the City Council or the State Public Utilities Commission has the right to grant bus franchises within the city limits.

Railway Sustained in Revocation Action

Controversy has developed over the Eastern Massachusetts Street Railway's track location in Mason Street in Salem, Mass. In 1909 the Aldermen there awarded the railway a location in the street so as to supply the power house with coal. The company now purposes to convert the power plant into a carhouse and to have the approach through Mason Street; but the City Council of Salem last July voted to revoke the track rights in Mason Street and ordered that the tracks be torn up. The Council took the position that here was no "public convenience and necessity" for the use which the present Board of Public Trustees intended to make of the location. The Mayor of Salem approved the Aldermen's order. The trustees of the Easttern Massachusetts disagreed with this decision. As a result the Salem city government appealed to the Department of Public Utilities, but the department, on Nov. 24, filed a decision adverse to the city. The commission points out, however, that the Salem city government has the right to appeal to the courts. Two members of the Public Utilities Department dissented from the majority decision, partly on the ground that the decision of he city authorities should be undisturbed unless it was shown to be "unreasonable or ill considered."

Buffalo Conductors Put on Their Honor

Fare boxes on all cars of the International Railway, Buffalo, were abolished on Sunday, Nov. 16, as a result of the honor system to be put into operation by Mitten Management, Inc. Herbert G. Tulley, president of the International, said to the platform employees:

> Mitten Management, Inc., has never considered the fare box in accord with the co-operative spirit. It has been awaiting an opportunity to make employees responsible for fares collected rather than depend upon a mechanical device to protect the company against employee dishonesty and to reduce the conductor to a mere changemaker, hopelessly trying to watch myriads of coins dropping into a small glass case.
>
> In the old days of low wages it was not considered an injustice to deprive the company of a few fares now and then. Those days are gone and most companies have replaced the old haphazard method with the drop coin fare box.
>
> Where fare boxes are used the conductor is required to ring up on his register for every person passing the box. The conductor ordinarily protects himself from loss by actually keeping his register lower than that of the fare box and tallies the two at the end of the run by ringing up a sufficient number of fares to make the two agree. This procedure, while protecting the conductor against personal loss, provides him with neither the means nor the incentive to see to it that every passenger is obliged to pay a fare.
>
> I. R. C. prefers to trust to the honesty of its men. This it has taken occasion to further encourage in that their higher wage will largely depend upon the collection of a fare from every passenger. I. R. C. trainmen have proved themselves worthy of this trust.
>
> I. R. C. will protect its earnings, first, by making payment of fare a personal transaction between the passenger and the conductor, thus preventing the passing of passengers without payment of fare; second, by giving its men such an interest in its earnings that robbing the company means robbing themselves.

Some time ago the company stopped the registration of transfers and passes.

High School Points Moral in Atlanta

The opening of the Girls' High School, in Atlanta, Ga., the first of next year may bring to a head the right of the public to demand new accommodations while denying sustenance to its railway. When the school board asked for more trackage and more cars to carry girls to and from the new school building, the Georgia Railway & Power Company responded by stating it had no money to lay new track or to buy and operate any extra cars. Preston S. Arkwright, president of the company, recently reviewed the situation. He said it would be difficult in any event to provide transportation for the students of the high school as the building was located in a most inaccessible place. Further, he said that the company was financially unable to make any extensions. On this point he said:

> You've got a right to depend upon the railway as the agency for reliable service. But that agency must be kept in condition to furnish the service on which you depend. You can't levy taxes, paving burdens and the like and on top of it all turn jitneys loose and expect the railway always to be in the position to meet the demands of the public. I guess it will be either the steel cars or the jitneys.

H. M. Atkinson, chairman of the company's board of directors, corroborated Mr. Arkwright's statements. The chairman said that the railway receipts were decreasing from the corresponding periods of last year at the rate of almost $50,000 a month, and that even last year they were far below normal. He said that under the contract with the city the company was paying in 1924 in bridge rentals, paving service and taxes more than $800,000, which is about one-sixth of the entire railway revenue.

It is expected that the John A. Beeler organization will soon report on the valuation of the Georgia property to the special councilmanic committee conducting an investigation into the petition for relief filed by the company with the City Council in December, 1923. The company sought relief necessary to place the railway on a "living basis." Among other things it asked for elimination of jitney competition on streets where cars operate, 10-cent cash fare, a continuation of the ticket rate for 6⅔ cents and the elimination of all gross profits taxes and street paving assessments.

New England Motor Transport Conference

A conference to discuss the highway transportation problems of New England will be held at Boston on Dec. 8 and 9, under the guidance of the National Automobile Chamber of Commerce, and with the co-operation of many New England organizations representing motor vehicle users. Electric and steam railroad men will be among the speakers, and special sessions will be devoted entirely to discussion of how electric railways are using the motor bus, and how railroads are solving, with the motor truck, the problem of handling local less-than-carload freight.

Other topics will be intercity motor coach operation, what the commercial use of New England's new highway system means, and how the automobile is helping to reclaim New England's deserted farms, the federal government's research program into the economics of road use and a discussion of safety and highway congestion.

Home Rule Law Ambiguous

Representative of Railways Wants the Measure Amended so There Can Be No Doubt About Its Meaning

The Home Rule Commission held a public hearing at Albany on Nov. 20. Since the enactment of the city home rule law, the Home Rule Commission has extended its study of municipal self-government in New York and other states and, as asked by municipal officials, has examined certain questions which have confronted several of the cities of the state in applying the provisions of the home rule law and in operating thereunder. The commission has attempted a solution of some of these difficulties and has endeavored to aid the cities with its advice in all cases in which application has been made therefor. The hearing was regarded as most important because of the possibility that some provision allowing cities further jurisdiction over public utility corporations might be allowed to get into the home rule for cities law.

James L. Quackenbush, on behalf of the Interborough Rapid Transit Company and other street railways, submitted to the commission a memorandum urging an amendment to the law. Very briefly the purpose of Mr. Quackenbush's proposal is to remove the doubt and uncertainty that prevails with respect to the power of the Municipal Assembly of New York City and the legislative bodies of other cities of the state to annul or supersede various provisions of the public service commission law, the railroad law, the transportation law and the rapid transit act.

SAYS LAWS SHOULD LESSEN LITIGATION

Mr. Quackenbush said that it could be urged that judicial interpretation of the act would probably exclude the right of local legislative bodies to supersede any provision of the laws mentioned, but that so long as the home rule law remained in its present form and until the courts had construed its provisions in cases arising from time to time the uncertainty would remain and give rise, as it already had done, to many contentions, embarrassments and delays that could be obviated by the amendment proposed.

The attorney said that the limitations that the courts, by judicial construction, will ultimately place upon the right to supersede state statutes by local legislation should so far as possible be explicitly stated in the act itself. Mr. Quackenbush holds that otherwise the Legislature is placing an unnecessary burden upon the courts, and is chargeable with responsibility for the delays and uncertainties incidental to litigation. He says that laws should tend to lessen litigation rather than to encourage it. He then cited as a specific instance the difference of opinion between the Corporation Counsel and the Comptroller of the city of New York with respect to the scope of the city home rule law that largely involves a determination of what are "matters other than the property, affairs or government of cities. This controversy involves in part the right of the municipal Assembly to amend a portion of the transportation corporation law in its application to the city of New York." In this controversy the comptroller clings tenaciously to the opinion that with the sanction of the municipal Assembly the city can proceed with the Mayor's municipal bus plan without the need for further enabling legislation, while the Corporation Counsel holds to a contrary view.

Other subjects discussed at the hearing were:

1. Necessary and desirable amendments to the home rule constitutional amendment.
2. Scope of term, "property, affairs and government." Does it include all matters usually embraced in city charters?
3. Right of the Legislature to enact general laws relating to property, affairs and government of cities.
4. What general laws apply "in terms and effect alike" to all cities?
5. Necessary or desirable amendment to the home rule law.
6. What difficulties or doubts have been experienced by municipal authorities in construing and operating under the home rule law?
7. Is the duty of the Legislature to limit the power of cities to borrow money, etc., under Sec. 1 of Article XII of the Constitution, to be performed by the enactment of general laws or emergency laws, or may the Legislature so act by a special law.
8. What disposition should be made of Article II of the general city law. (General provisions.)
9. What disposition should be made of the optional city law?
10. Should there be a statutory classification of cities for convenience in enacting city laws and relating to their property, affairs and government?

Advisory Council on Accident Prevention in Chicago

To co-ordinate activities in the important work of preventing accidents on the Chicago Surface Lines, a general advisory council on accident prevention has been established with the following members: V. T. Noonan, chairman; H. H. Adams, C. H. Evenson, H. B. Fleming, F. M. Hamilton, F. L. Kriete and J. Z. Murphy.

The direction of accident prevention work in each department will be delegated to departmental councils which will supervise and direct protective and preventive measures within their respective jurisdictions and carry into effect plans that will insure full co-operation on the part of all employees.

It will be the duty of the general advisory council to investigate reports of unsafe conditions or dangerous practices, to provide appropriate remedies therefor and to formulate policies for the most effective promotion of accident prevention.

New Cars Allocated in New York

The New York Transit Commission issued an order on Nov. 17 to the Interborough Rapid Transit Company allocating to service on various subway lines, where the commission believes there is the greatest need, the 100 new cars recently delivered of the 350 ordered by the railway under the commission's instructions. Improvement of rush-hour conditions at the Times Square station was an important item in the order.

Railroad and Ferry Traffic in 1923—325,920,315 Passengers

The need of future provision for the handling of suburban passengers into New York City was recently made plain by figures made public by the New York Transit Commission giving the steam railroad and local ferry traffic into and out of New York in 1923. The great growth of local commutation traffic within the past few years has been studied by the engineers of the Commission who are preparing to arrive at a definite policy of handling the situation.

The trunk railroads entering New York or approaching from the Jersey side carried in 1923 a both-way passenger traffic of 234,867,481 people. This figure represents an increase of nearly 5 per cent over the traffic in 1922. This traffic includes the following: Baltimore & Ohio 620,000; Central Railroad of New Jersey 15,752,834; Delaware, Lackawanna & Western 22,201,447; Erie 30,889,917; Lehigh Valley 743,502; Long Island 69,766,867; New Haven 17,666,194; New York Central 30,025,529; New York, Ontario & Western 551,753; New York, Westchester & Boston 5,796,093 and the Pennsylvania Railroad 40,853,345.

In addition to the figures of steam railroads there were 42,014,142 local or rapid transit passengers carried in and out of the city by the Hudson & Manhattan Railroad which when added to the steam railroad traffic gives a grand total railroad traffic entering and leaving the city of 276,881,623. Even this total does not include the passengers entering and leaving the city on several ferry lines. Total traffic by ferry in and out of New York amounted to 49,038,692. With the steam railroad traffic there was a grand total of railroad and ferry traffic in and out of New York during 1923 of 325,920,315 passengers.

The number of railroad commuters entering and leaving the city on the various railroad lines was 147,172,484. The grand total of railroad and ferry commuters was 238,225,318.

Eliminating Sundays and holidays, and using a traffic year of 340 days, the basic figure generally employed by the Transit Commission—as a divisor—there are shown to be an average of 700,662 daily commuters in and out of the city. The total daily traffic in and out of New York City is 958,589. These figures represent two-way traffic passengers. The difference between the two, divided by 2, or 129,000 passengers, probably represents an approximate figure of the daily visitors to New York City, the great majority of whom arrive from outside the commuting zone.

State Control Urged for Missouri Bus Lines

The Missouri Legislature, which will convene next January, will be asked to enact a law placing all bus lines in Missouri under the control of the Missouri Public Service Commission. The measure that will be presented to the state lawmakers will probably require all bus companies and service car organizations to report regularly to the state body concerning their profits, etc., and also to provide indemnity bonds for the protection of their patrons.

In St. Louis the present regulatory body is the Board of Public Service, working under a city ordinance passed several years ago by the Board of Aldermen. Under the city ordinance the bus company pays the city 3 per cent of its gross earnings, but is not required to submit a statement of profits.

Richard W. Meade, president and general manager of the Peoples Motorbus Company, has stated that his company would welcome a law placing it under control of the Missouri Public Service Commission. Mr. Meade is quoted as follows:

> Such control already exists in New York and other States. We would also favor a provision requiring monthly statements of earnings such as are submitted by other public utilities. The Peoples Motorbus Company already carries ample indemnity bonds and sets aside a certain percentage of its earnings for an accident reserve fund in addition.

Advertising to Help Company and Patrons

In an effort to picture some of the difficulties that are encountered in railway operation to the end that the public will give its co-operation in solving problems the Worcester Consolidated Street Railway, Worcester, Mass., has been using space liberally in the advertising columns of the Worcester newspapers. General Manager Henry C. Page says the results have been satisfactory and that he hopes advertising, never before done in Worcester by his company, will become a permanent policy. "We have a commodity to sell," Mr. Page explains, "which is as important to every householder in Worcester as the merchandise sold by the department stores, and the fact that we have a monopoly is no reason why we should not advertise it." He said he was particularly well pleased with the slogan in the recent advertising, "Help us to help you to better service."

British Expert Praises Detroit System

The Department of Street Railways, Detroit, Mich., has come in for a lot of praise from Lord Ashfield, one of the foremost authorities on transportation. The chairman and managing director of the railway, tramway and omnibus companies of the "Underground" group of London recently visited Detroit and predicted that the municipally owned lines would be a great success so long as the people continued to keep politics out of the system. He said that he had traveled on the lines and had been impressed with the smoothness of operation and the remarkable ability displayed in handling the crowds of workmen. He says it is an efficient system, splendidly managed. Lord Ashfield, formerly Albert Henry Stanley of Detroit, came with his family to Detroit when he was a small boy. He was general manager of the Detroit United Railway for twelve years.

Canadian Railway a Public Benefactor

Capilano Canyon, a famous beauty spot near Vancouver, B.C., has been presented outright by the British Columbia Electric Railway to the Vancouver Board of Trade, to be retained by it in trust for the public as a park. Approximately 145 acres is comprised in the gift. "We feel that this property should belong to the public in deed as well as in name," said George Kidd, president of the British Columbia Electric Railway in making the presentation.

The property was acquired by a predecessor company, evidently for a hydro-electric power site. Ever since it has been the Mecca for thousands of tourists. Recently the company was offered a considerable sum for a portion of the canyon by an individual who intended to promote it as a pleasure resort. Turning down this offer, the company decided to present it to the Board of Trade.

The gift has resulted in a great many expressions of appreciation by press and public. The following statement by J. K. Macrae, president of the Board of Trade, was only one of many: "The present offer was entirely unsolicited on our part, and the greatest credit is due to the company and to Mr. Kidd for the splendid public spirit which has prompted them to make this gift."

Wildcat Buses in New York a Menace

Condemning the "municipal buses" operated under the jurisdiction of the Department of Plant and Structures of the city of New York as "wildcat firetraps," the New York Transit Commission, in a statement issued by Commissioner LeRoy T. Harkness attacked the "emergency bus system" maintained by the present city administration. The attack came after a municipal bus, operated in Queens County, caught fire with serious injury to several passengers. An investigation of the matter by the grand jury is now under way. As no one was killed probably only civil indictments will result.

Commissioner Harkness disclosed the sensational conditions discovered by Transit Commission inspectors on several municipal bus lines in Manhattan, the Bronx and Queens. Not only was overloading revealed, but in many instances, it was charged, the vehicles were either not equipped with "emergency doors" in the rear, or these doors were fastened in such a way as to be useless in emergencies.

"The burning of passengers in these wildcat firetraps," said Mr. Harkness, "is not the only danger to the traveling public. Most of these buses are simply bodies mounted on truck chassis, and were never intended to carry human beings."

"The dangerous and deplorable conditions revealed by the Queens accident," the statement declares, "merely dramatized the menace to passengers through the operation of wildcat buses which do not have the safeguards provided by adequate franchise restrictions and general utility regulation."

Plea for Restoration of Service on Wisconsin Line Dismissed

The Railroad Commission of Wisconsin has dismissed the petition of residents of Omro who asked it to order the Wisconsin Power & Light Company to re-establish railway service between Oshkosh and Omro despite the fact that it has been operating at a loss due to improved highway conditions and the increased use of the private automobile. Bus service has been established on a schedule comparable with that of the discontinued interurban line, but fear was expressed that during the winter months bus service would not be as reliable as rail service. A statement of earnings and expenses introduced before the commission by the company for the year 1923 showed a deficit of $4,215. The resumption of service would necessitate a complete rehabilitation in all departments of the system. To do this to conform with the present standards of the company would cost $146,716.

Grand Rapids Company Submits Interesting Data on Car Capacity

A recent survey of daily traffic on Monroe Avenue in Grand Rapids, Mich., over which cars of practically all routes of the Grand Rapids Railway pass showed that from 4 to 6 p.m. on an average day 102 cars passed capable of carrying 4,032 passengers and actually carrying 3,628. In the same period 1,052 automobiles passed with a total capacity of 4,532 passengers and actually carrying 1,918. The street cars carried 98.8 capacity loads, while the autos carried 42.5 per cent.

The railway made a diagram of these figures and submitted it to its patrons. The diagram pictures one street car which would carry 48 passengers and under it and on the same scale were pictured 27 automobiles, the number needed to carry 48 passengers at 1.8 passengers per automobile, as was the case on the test day. The 27 automobiles easily took up six times as much space on the rush hour street as the single street car.

On the particular day in question the street space occupied by the street cars figured 4,692 ft. and that by the autos 14,728 ft. or 75.8 per cent of the street space or more than three times the space occupied by the street cars. These 102 street cars were only 8.83 per cent of the traffic, but they carried 63.8 per cent of the passengers.

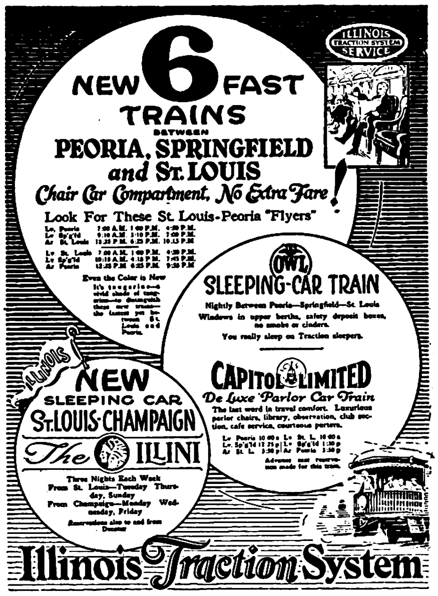
Newly Organized Company Promises Good Service

The newly organized Erie Railways, Erie, Pa., will put into effect any reasonable measures which will improve service in Erie. These promises were made recently by R. A. Meyers, general manager of the property, at a conference held in the office of the city solicitor. Mr. Meyers said that some time ago a campaign was started to have service speeded up for the benefit of patrons, and it was in connection with this plan that the cars were made pay as you leave on outbound trips to facilitate service downtown. At the same time the pay-as-you-enter plan was put into effect on inbound trips to prevent delays in the business district and to aid in discharging passengers. He said that the plan was to increase the capacity in accordance with the demands for service and that every suggestion that had been brought to the company's attention for the betterment of service was receiving serious consideration.

Interurban Advertises Improvements in Service

Many improvements and innovations in service mark the general change of schedules put into effect by the Illinois Traction System, Peoria, on Sunday, Nov. 9. Without exception on the main divisions the changes include the addition of trains and shortening of schedules.

The principal innovation is the inauguration of three "fliers" each way daily connecting Peoria. Springfield and St. Louis. These trains make the trip from the heart of Peoria to the heart of St. Louis in less than 5½ hours. They are in addition to a de luxe parlor car train each way daily which leaves each terminal at 10 a.m. The three new trains are distinctive in design. The coaches are painted a vivid tangerine color and contain a chair car compartment. No extra seat charge is made on these trains. They are to be known as the Peoria-St. Louis Fliers.



ILLINOIS TRACTION SYSTEM SERVICE

NEW 6 FAST TRAINS BETWEEN PEORIA, SPRINGFIELD and ST. LOUIS

Chair Car Compartment, No Extra Fare!

ILLINOIS NEW SLEEPING CAR ST. LOUIS-CHAMPAIGN

The ILLINI

Three Nights Each Week
From St. Louis—Tuesday Thursday, Sunday
From Champaign—Monday Wednesday, Friday

Reservations also to and from Decatur

Illinois Traction System

Ad Typical of Recent I. T. S. Campaign

The de luxe parlor car train is known as the Capitol Limited. It continues to serve meals à la carte and has such refinements as library and club sections, observation platform and reserved parlor chairs.

On the Springfield-Decatur-Champaign-Danville division four fast trains have been placed in service each way daily instead of two. These trains make the trip from Springfield to Danville in 4 hours and 15 minutes.

Three fast limited trains have been placed in service each way daily connecting Peoria, Bloomington and Decatur, whereas two have been on the schedule.

Another step forward is marked in the sleeping car service started on the route connecting Champaign, Decatur and St. Louis. The sleeping car leaves Champaign on Monday, Wednesday and Friday nights, and returning leaves St. Louis on Tuesday, Thursday and Sunday nights. It is named the "Illini," in deference to the famous university at Champaign-Urbana.

Service between suburban points and their nearest terminal cities has been augmented with the addition of "turn-around" trains, notably between Morton and Peoria; Danvers, Heyworth and Bloomington, and Riverton and Springfield.

No changes are made on the Ridgefarm or Catlin divisions, but train time has been altered on trains on the Homer, Mechanicsburg and Hillsboro divisions.

The improvements in service were advertised widely in the newspapers in the territory in which the company operates.

Another Paper Sees the Injustice of the Paving Charge

"As a matter of equity it does not seem fair that the International Railway should still be compelled to maintain the pavement and make repairs to the street between its rails," says the Buffalo *Evening Sun* in commenting on the franchise of the railway which provides that the company maintain the pavement between its tracks in the city. The newspaper says, "It is a heritage of horse-car days," and adds:

> At the time when this system of street paving was adopted there was one or more perfectly good reasons for the practice: First, because the street car horses had to have a non-slippery surface on which to travel while drawing the cars with their heavy loads; second, because much of the heavy trucking in the city was hauled by horses that also required such a surface in bad weather.
>
> Today this strip of rough stone pavement is an anachronism. The street cars are not drawn by horses and most of the heavy trucking is done by auto trucks. It is time that this historical rough strip was abandoned and that asphalt should replace stone as fast as new tracks are laid or important repairs are necessary. Those stone-paved surfaces are no more needed on the street with car lines than they are on any other comparatively level streets.
>
> It may not be popular to say it, but it also is true that with the passing of the horse-drawn cars and the substitution of trolley-driven cars, all real reason has passed for saddling on the street car company the keeping up of the pavement between the tracks and along their outer rails.
>
> It is true that the International Railway's franchise imposes this requirement on it—and the company has not been considerate enough of the Buffalo public to make a proposal to relieve it of part of its burden generally acceptable.

New Safety Laws Urged.—Amendment of the traffic law to provide for the full stop of all street cars before crossing arterial highways will be urged by City Commissioner Pier at an early meeting of the City Council of Portland, Ore. At present cars are not obliged to stop at the "full stop streets" and this is said to be confusing to motor drivers. Commissioner Pier has been investigating the matter and reports that in his belief many of the accidents in which street cars and motor cars figure are due to failure of street cars to come to a full stop at the busy arterial highway crossings.

News Notes

Tramway Wants Increased Fare.—The Denver & Crown Hill Railway, a branch line of the Denver Tramway, operating from a junction of the city lines to the Crown Hill Cemetery, a distance of about 1 mile, has petitioned the State Public Utilities Commission for permission to raise the fare from 5 cents to 8 cents, effective on Dec. 1. It is claimed that the road has operated at an annual deficit of between $5,000 and $8,000. Only one car operates on the line.

Must Continue Bus Service.—The Pennsylvania Public Service Commission recently disposed of an application to discontinue bus service. The York Railways, York, Pa., organized the York Transit Company to supplement railway service with buses. After eleven months operation an application to discontinue the bus service was filed. It had yielded $3,011, which was $5,717 less than it had cost. The commission held that the service was necessary and denied the application for permission to quit, giving the company the right to renew its application, however, if, after three or four months trial of rates considered by the company to be sufficient to yield operating expense and fair return, it should be found that the service could not be operated profitably. The old rates averaged 4 cents a mile.

Agitation Over One-Man Cars.—Formal notice has been served upon the International Railway, Buffalo, N. Y., by the municipal authorities demanding immediate withdrawal of one-man cars. The city also has asked the Public Service Commission to take action. Herbert G. Tulley, president of the International, says one-man cars have come to stay.

Petitions to Run Supplementary Buses.—The Roanoke Railway & Electric Company, Roanoke, Va., has petitioned the State Corporation Commission for permission to establish a supplementary bus line. The company states that its appeal is based on an understanding of the public's "demand . . . for interurban bus transportation."

Seeks to Enjoin Bus Operation.—Parlor car service of the Iroquoise Trails Motor Coach Lines, Inc., between Rochester and Buffalo, N. Y., was halted on Nov. 21 when the Rochester, Lockport & Buffalo Railroad obtained a temporary restraining order, pending trial of an action in Supreme Court. The railway will sue for a permanent injunction on the ground that the bus company is operating in competition without permission from the towns and villages it serves and without a certificate from the State Public Service Commission.

Railway Favored for Football Jaunts.—The Michigan Electric Railway, Jackson, Mich., has called the attention of parents to the desirability of having their children travel to the high school and college football games by the company's interurban system rather than in automobiles. It draws attention to the fact that two serious mishaps have recently occurred near Jackson in such automobile jaunts. Athletic Director Mason of the Jackson public schools has taken a stand against boys traveling in automobiles to and from schools or to out-of-town events. He has arranged for special cars on the Michigan Electric Railway from Jackson to Grand Rapids for his team and any rooters who wish to accompany it. Special rates are granted, in such instances. The railway believes that at such times the excitement and natural exuberance over the coming events cause mishaps, and in that emergency the electric railway is the way of sureness and safety.

Granted Bus Franchise.—The Portland Electric Power Company, Portland, Ore., has been granted a franchise to operate a bus line on East Thirty-ninth Street, to connect with the railway lines. The bus line will be operated as a crosstown line. The franchise will run for six months.

City Officials Sued.—Claiming that her husband was killed by a trackless trolley on Victory Boulevard, Staten Island, March 10, 1923, Mrs. Eva Chrampanis has filed suit for $75,000 in the county clerk's office in St. George, Staten Island, against Mayor Hylan, the five Borough Presidents, Murray Hulbert, President of the Board of Aldermen, and Grover Whalen. This is the second time that Mrs. Chrampanis has brought suit in the matter. Following the accident she sued the city of New York and the case was argued before Justice Selah B. Strong in the March term of this year. Counsel for the city asked for a dismissal on the ground that since the trackless trolley on Staten Island was being operated without a franchise from the city of New York, the city could not be held responsible for the death of her husband. Justice Strong granted the request for dismissal. Arthur M. Simonson, attorney for Mrs. Chrampanis, then sought permission to lodge a complaint against individuals.

New Railway in Prospect.—Plans are under way for connecting Mariemont, east of Madisonville, with downtown Cincinnati, Ohio, by electric railway. Negotiations have been in progress for some time through which, if completed, the cars of the Cincinnati, Milford & Blanchester Traction Company will be brought over the tracks of the Cincinnati Traction Company to Cincinnati. B. H. Kroger, president of the Cincinnati, Milford & Blanchester Traction Company, said that the matter had been taken up with officials of the traction company and that plans had been discussed. Mr. Kroger said that plans are being held in abeyance until the new electric railway charter has been agreed upon. Recently the Cincinnati, Milford & Blanchester Traction Company purchased a strip of property in downtown Cincinnati which is being considered as a possible site for the new downtown terminal of the interurban.

Wages Advanced Two Cents.—Platform employees of the Rochester, Lockport & Buffalo Railway operating an interurban line between Rochester and Lockport, connecting at the latter city with the International Railway for Buffalo, have been granted a wage increase of 2 cents an hour after a conference between the management and James Largay, Utica, vice-president of the Amalgamated. The agreement ends a two-year dispute over wages which threatened a strike two weeks ago. The new scale became effective on Nov. 1.

Eighty Buses in Service.—During the past month the Pennsylvania Power & Light Company started bus service between New Castle and Sharon, Pa. This addition brings the total number of buses operated by the Republic Railway & Light Company, the controlling company, up to 23 in interurban service and 57 buses in city service.

Seeks Advanced Rates. — The Virginia Railway & Power Company has petitioned the States Corporation Commission for permission to increase its present fare from Richmond to Petersburg from 47 cents to 60 cents and to advance the ticket rate from 42 cents to 55 cents. Commutation rates under this petition would be raised from $3 to $3.50 for a minimum distance and from $13.75 to $16.50 for the full trip. The petition was signed by President Wheelright. It said that the commission had found the value of the interurban division $1,210,000, and that earnings for the nine months ended Sept. 30, 1924, were $40,646 and for a similar period last year $36,869. The actual return on this valuation for the year 1923 was only 3 43 per cent, deducting the sum of $15,000 which the commission said was a proper charge to be made against the Richmond-Petersburg divisions for transfers to and from the interurban line.

Will Repeal Bus Tax Ordinance.—Acting on what it alleged was a refusal by the Duluth-Superior Traction Company to furnish bus service to residents in and between Allouez and Itasca, suburbs of Superior, the City Commissioners have voted unanimously to repeal the city's bus tax ordinance, which provided a tax of $500 on each jitney placed in city service. The City Commissioners contend that when this ordinance was adopted it was the understanding of the City Commission that the railway would place a bus in service between these points.

Complaint Dismissed. — The California Railroad Commission has dismissed the complaint of the city of Piedmont against the Key System Transit Company, charging discrimination against the city of Piedmont in the matter of interurban fares. The defendant company has complied with the order of the commission to remove the discrimination. It is now operating interurban trains over an extension of the Piedmont line from Fortieth and Piedmont Avenue in Oakland to Oakland and Jerome, in Piedmont.

Seeks Increased Fares.—The Athens Railway & Power Company, Athens, Ga., has petitioned the Georgia Public Service Commission for permission to issue weekly passes for $1 and to increase cash fares from 7 cents to 10 cents. The company also wishes to sell books of tickets at the rate of two for 15 cents if the 10-cent cash fare is granted. Fares in Athens have been 7 cents since September, 1921.

Financial and Corporate

I. R. T. Reports $359,025 Deficit

Net Corporate Income Increased by $1,202,972—Traffic Up on Subway and Manhattan Divisions

The net corporate income of the Interborough Rapid Transit Company, New York, N. Y., for the year ended June 30, 1924, was $1,071,177, against a net corporate deficit of $131,795 in 1923, or an increase of $1,202,972. The surplus at the end of the year was $391,534, compared with a deficit for the year ended June, 1923, of $524,783.

The number of passengers carried was 1,074,343,243, compared with 1,025,175,131 last year, an increase of 49,168,112. This was due to a gain of 38,282,756 on the subway division and a gain of 10,885,356 on the Manhattan Railway division.

COMPARATIVE STATEMENT OF INCOME ACCOUNT, YEAR ENDED JUNE 30

	1924	1923
Gross operating revenue..	$57,773,775	$55,559,435
Operating expenses......	33,841,415	34,392,508

Income from operation.	$21,168,830	$18,504,616
Non-operating income....	402,762	573,850
Gross income.........	$21,571,592	$19,078,466
Income deductions.......	20,500,416	19,210,261
Net corporate income for the year.........	†$1,071,176	*$131,794*
Add:		
Surplus at beginning of year...............	*524,783*	*524,866*
Profit and loss account —net change during the year............	*154,859*	131,878
Surplus or deficit at end of year*................	†$391,534	*$524,783*

* Stated exclusive of accruals under contract No. 3 and related certificates payable from future earnings but with full deduction for sinking fund on first and refunding mortgage bonds, the payment of which is under the "Plan of Readjustment," postponed for five years from July 1, 1921, provided an amount equal to such postponed sinking fund be expended for additions or improvements to the property.

† Stated exclusive of expenditures for maintenance in excess of contractual provisions aggregating $1,430,202, leaving a balance (deficit) after actual maintenance of $359,025 for the year.

Figures in italics show deficit.

An expenditure of $5,909,509 was made during the year for additions, betterments and replacements. This amount included the company's contribution toward construction and equipment under contract No. 3 and the related certificates, completion of the multiple-unit car door control device on 1,378 subway cars and a considerable portion of the cost of installing multiple-unit car door control devices on 465 Manhattan division cars, also the cost of completing 100 subway steel trail cars put into use during the summer of 1923.

The increase in revenues from transportation for the year was $2,446,446. While the greater part of this gain was on the subway division, the Manhattan Railway division showed an increase of more than 3 per cent, most of which, according to the report, may be attributed to increased service and improvements in the condition of the cars and stations, together with increased patronage resulting from advertising. There was a decrease in the other operating revenue of $232,107, leaving a net increase in gross operating revenue of $2,214,339. This falling off in other operating revenue resulted from a decrease in the sale of power of $322,000, partially offset by an increase in advertising and rentals.

The cost of conducting transportation during the year was $959,588 less than the previous year, although the car-miles operated increased 7,310,000 and wage rates were 5 per cent higher.

It was necessary to expend for maintenance $1,364,464 more than in the previous year, to keep the property in a safe operating condition. Considering the actual maintenance expenditures the total expenses for operating and maintaining the property for the year were $35,271,618, compared with $34,829,706 in 1923. The increase in general expenses was $36,720 over the previous year, although the amount expended in the settlement of accident and damage claims showed an increase of $75,123, due largely to the necessary postponement of the settlement of such cases during the past few years.

STATEMENT OF INCOME DEDUCTIONS, YEAR ENDED JUNE 30, 1924

Gross income...........			$21,571,592
Rentals:			
City of New York:			
Interest on city bonds		$2,049,182	
Sinking fund........		561,817	$2,610,999
Manhattan Railway:			
Interest:			
Consolidated mortgage 4 per cent bonds..........		$1,627,320	
Second mortgage 4 per cent bonds..		180,920	
Fixed rental—organization............		50,000	
Dividend rental on capital stock......		2,723,877	4,582,117
Total......................			$7,193,116
Interest and sinking fund charges—On securities issued by Interborough Rapid Transit Company:			
First and refunding mortgage 5 per cent gold bonds:			
Interest..	$8,066,992		
Sinking fund...	2,170,556	$10,237,548	
Ten-year 7 per cent notes—interest......		2,246,419	
Ten-year 6 per cent notes—interest......		260,908	
Equipment trust certificates, Series "A" —interest..........		70,420	12,815,297
Other deductions:			
Sundry rents........		$264,659	
Interest on unfunded debt...............		178,543	
Interest on investment of depreciation reserve		48,800	492,002
Total income deductions.........			$20,500,416
Net corporate income............			$1,071,176
Maintenance expenditures in excess of contractual provisions..............			1,430,202
Balance (deficit) after actual maintenance.......................			$359,025
Per cent expenses to earnings..........			58.57
Passengers carried..................			1,074,343,243

The net result of the operation of the Interborough system, after deducting the actual maintenance expenditures, shows an improvement over the previous year of $209,966. This figure is arrived at after deducting the Manhattan dividend rental of $1,013,877 in excess of the previous year, including a reserve of $233,877 to cover the amount of additional dividend rental from July, 1, 1922, to June 30, 1924, which might become payable to owners of Manhattan stock not agreeing to the plan of readjustment.

Following an order from the Transit Commission, under date of Aug. 22, 1923, directing the purchase of 100 additional steel motor cars for use in the subway division, arrangements were made for the purchase of these cars through an equipment trust, whereby 25 per cent of the cost, estimated at $3,000,000, was paid in cash and the balance through the issuance and sale of $2,250,000 of equipment trust certificates, bearing interest at the rate of 6½ per cent.

BUSES AS ADJUNCT TO RAILWAY

In his report to the stockholders Frank Hedley, president and general manager of the Interborough property, states that since the report was prepared several applications for franchises to operate comprehensive bus systems have been filed with the public authorities. He said that the Interborough's position was that there should be no extensions of existing bus lines, except as feeders for the rapid transit lines. He said the operation of buses over the routes contemplated in the franchise applications recently submitted would seriously affect the net revenues of the company and its ability to pay interest on the city's bonds issued for construction purposes. It was his idea that bus operation should be rendered as an adjunct to the rapid transit lines, in which the city is financially interested under the provisions of the existing contracts. He concluded by stating that 30 years ago the city adopted a policy of underground transportation, with ultimate municipal ownership, and that it should not now revert to a policy of 70 years ago of coach transportation with private ownership.

The accompanying tables show the income account of the company for the fiscal year ended June 30, 1924, compared with the year before, also the income deductions for the year ended June 30, 1924.

Line to Be Reorganized.—The Portsmouth, Dover & York Electric Road, Portsmouth, N. H., will be reorganized under the name of the Portsmouth, Kittery & Eliot Railway. The company will operate its cars from Kennard's Corner, Eliot, to Sea Point, Kittery. It is expected that service will start early in the new year. The incorporators include W. W. Sargent, president of the Fitchburg & Leominster Railway; Zelig Van Loan, E. A. Pierce, general superintendent of the Bellows Falls & Saxon River Railway, and Dr. Samuel Nason.

St. Louis Plan Approved

Terms Announced Under Which the Reorganization of United Railways Will Be Carried Out

Holders of the securities of the United Railways, St. Louis, Mo., and its subsidiary companies, were notified on Nov. 26 of the perfection of the plans for the reorganization of the company. With the exception of the first general mortgage 4s holders are instructed to deposit their securities with the respective depositories on or before Dec. 24. The general 4s are undisturbed by the reorganization plan. Under the terms of the plan a total of $41,296,000 of stock is eliminated, the amounts being $16,383,000 of preferred and $24,913,000 of common.

The reorganization is intended to terminate the receivership, bring about a fair adjustment of the respective interests of the various security holders, reduce the fixed charges to an amount safely within the earning capacity of the property, settle the litigation and controversies which have prevented reorganization of the properties, provide adequately for present and future capital requirements and place the property in a position to render the highest standard of public service. In particular, the reorganization is intended to prevent separation of the properties and to continue under one management all of the roads now comprising the United Railways system.

The new financial arrangement and agreement is dated Oct. 1, 1924. Under it the fixed charges of the company, including the sinking fund on the Suburban bonds, will be $1,927,000 as against $2,613,980 under the present organization.

The capitalization and annual charges after reorganization are estimated as shown in the accompanying table.

The proposed new capitalization is compared in the accompanying table with the obligations on the present outstanding securities of the company.

Holders of the bonds and stock of the company and its subsidiaries who have not already deposited their securities with their respective protective committees may become parties of the reorganization plan and agreement by depositing their securities with the depositories under their respective depository agreements.

Newman, Saunders & Company, Inc., New York, of which J. K. Newman, a member of the reorganization committee, is head, have agreed to form a syndicate of which it will be manager, to underwrite the 245,745 shares of new common stock to be offered the preferred and common stockholders of the present company.

PRESENT CAPITALIZATION AND CHARGES OF UNITED RAILWAYS

Amounts outstanding	Bonds	Annual charges
$30,300,000	United Railways Company first general 4s	$1,212;000
2,000,000	St. Louis & Suburban first mortgage 5 (8) per cent	160,000
4,500,000	St. Louis & Suburban general 5s	225,000
1,640,000	Cass Avenue & Fairgrounds Railway first mortgage 5 (6) per cent bonds	98,400
986,000	Compton Heights, Union Depot & Merchants Terminal Railway first mortgage bonds	59,160
1,474,000	Lindell Railway Company first mortgage 5 (8) per cent bonds	117,920

	Receiver's certificates	
4,200,000	Receiver's certificates Series B 6 per cent	252,000
	Total fixed charges	$2,613,980
	Stocks	
16,383,000	United Railways preferred stock	819,150
24,913,000	United Railways common stock	....
$96,186,000		$3,433,130

ESTIMATED CAPITALIZATION AND ANNUAL CHARGES AFTER REORGANIZATION

		Annual charges
$30,300,000	first general mortgage 4s, undisturbed	$1,212,000
6,000,000	first and refunding mortgage bonds or collateral gold notes of new company	390,000
4,500,000	first mortgage bonds of new Suburban	225,000
	Total interest charges	$1,827,000
	Sinking fund of $100,000 annual for retirement of Suburban bonds	100,000
	53,845 shares of new preferred 7 per cent stock	376,915
	343,645 shares of new common stock of no par value	....
	Total obligations on securities	$2,303,915

Chicago's Loop Has 1,200,000 People Daily

More than 1,200,000 persons pour into the loop district of Chicago every twenty-four hours, according to a traffic count made by the city's department of public service. Of the number more than 700,000 are carried by surface and elevated lines, buses and suburban steam lines. The figures were gathered by the department so that actual data might be had on a city's traffic problems for use in considering questions arising affecting pedestrians, motorists and street-car and elevated passengers might be settled on a definite basis with a regard for the greatest number.

The count showed that pedestrians numbering 182,011 came into the loop every day; 34,184 entered by commercial vehicles and 233,309 by passenger vehicles. The surface lines carried 475,237 persons and the elevated lines 189,905. Buses transported 74,000.

The figures for the loop-bound traffic of the surface and elevated lines are based on the average number of passengers carried a day during the first six months of the current year. The Chicago Traction and Subway Commission of 1916 had established, on the basis of an actual count, of all passengers carried by these lines, that of the 24-hour total surface lines traffic, 23 per cent was carried in or out of the loop, while of the total passengers carried by the elevated lines in 24 hours, 63 per cent are hauled to and from the loop district.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials.

†Beginning with this issue a slight change is made in the weighting employed in the electric railway wage index. This index represents on the base of 1923 = 100, the trend of maximum hourly wages of street and interurban railway platform men of about 100 of the largest companies in the United States. The weighting heretofore given to this index has been the number of passenger cars operated by the various companies. The weighting has now been changed to be in accordance with the number of trainmen (conductors, motormen and one-man car operators) employed by the various companies. Although the change is slight, it is thought the revised index is a more accurate measure of the trend in wages. Monthly index figures since January, 1923, on the old and new bases were published on page 787 of the issue of the paper for Nov. 1, 1924.

Canadians Oppose Stopping Service on Toronto Radial

Engineers of the Hydro-Electric Commission of Ontario have been authorized to prepare a report for submission to the city of Toronto setting forth the earnings, value and other statistics of the Schomberg division of the Metropolitan Radial Railway in explanation of the commission's decision to suspend service over the road. It was also decided to notify the municipalities which are affected that under the radial agreement they have the right to acquire the line if they so choose. Apparently the Schomberg division must go unless the municipalities which it serves choose to take over its operation.

King Township residents declare that the proposal of the commission to scrap the Schomberg division would bring economic destruction to the several villages which it serves. In consequence township officials are preparing a campaign of vigorous resistance to the project. York County Council will be asked by the township to join with it in a protest to the Hydro commission. In the event of this failing to bring results an appeal may be made to the Dominion Railway Commission to have the Schomberg line taken into the national system.

Employees Handle Stock Sale in Birmingham

Approximately 4,000 shares of preferred stock of the Birmingham Electric Company, paying 7⅕ per cent interest, were sold to Birmingham, Ala., people during the first week of a drive to sell an issue of 20,000 shares of the stock locally. The sale started formally on Nov. 10 and is being handled by employees of the company. Employees bought 2,400 shares of the stock before the formal offering to the public and more than 70 per cent of the employees subscribed, it is stated. The stock, which is no par value stock, is being sold at $97 per share and is callable at $110 per share. The proceeds of the sale are to be used in gas and electric extensions.

As an advertising feature in connection with the stock sale four cars of the company were painted white with advertisements of the stock sale in large black letters on them. The ads read "Invest in Our Preferred Stock. It Pays 7⅕ per Cent. It's Safe. Our Employees Sell It."

In addition to the white painted street cars, newspaper and billboard advertising as well as posters in all street cars are being used.

New Third Avenue Director.—At a meeting of the Third Avenue Railway, New York, on Nov. 12, William Carnegie Ewen was elected a director of the company. He succeeds Harry Bronner of Blair & Company, New York, resigned. Mr. Ewen is an investment banker with offices in New York. He has in the past specialized in New York city traction securities and is regarded as being unusually well informed with respect to the history of the various companies in New York City and on the possibilities of the territory in which they operate.

City Wants Payments on Time.—At a conference with Mayor Kendrick, his cabinet, the Council and the Transit Commission, T. E. Mitten of the Philadelphia Rapid Transit Company announced that his company stood ready to carry the interest and sinking fund charges, but he asked that during the early operation of the new subway the amounts to be paid by the company be less than during the later years of the arrangement. He added that the company eventually would pay the equivalent of all interest and sinking fund charges of the entire 50 years. Both the Mayor and president of the Council declared that such procedure would impair the city's improvement program by tying up some of its borrowing capacity. A member of the Council's finance committee named by the Mayor as one of the four city representatives to confer with the company's officials on details of the Chestnut Street subway agreement said that the city must insist that the company be not permitted to interfere with the city's development program by slowness in taking over the full yearly burden.

Deficit in September.—For the month ended Sept. 30, 1924, the Municipal Railway of San Francisco, Cal., reports total receipts of $270,881 and total operating expenditures of $203,722. The excess of receipts over expenses for the month was $67,160. After the consideration of reserves, amounts for depreciation and interest charges, the net deficit from operations for September was $454.

Return Less than 1 per Cent in Mobile.—The financial statement of the operations of the Mobile Light & Railroad Company, Mobile, Ala., for the year beginning Oct. 1, 1923, and ending Sept. 30, 1924, made in connection with a recent abandonment petition shows railway revenue of $747,801. Operating expenses and taxes were $715,770; net $32,031; bond interest, $67,595; other interest, $900; total interest, $68,495; deficit after interest, $36,463; paving assessment, $2,216; deficit after paving assessment, $38,680; sinking fund, $25,000; deficit after sinking fund, $63,680. Including operation of the Chickasaw line, which was not valued by the Public Service Commission, the net income was 0.85 per cent on the valuation of $3,765,369, it was stated in the company's recent plea for abandonment of some lines.

Buses Meet With Losses.—Bus service maintained by the Seattle Municipal Railway in connection with the car lines is a financial loss to the railway system, Superintendent D. W. Henderson reported to the City Council recently. During the first nine months of 1924 the loss amounted to $20,125. The Council has before it an ordinance appropriating $17,000 to purchase two buses for operation on Empire Way, and Superintendent Henderson recommends against such a move, stating that at least three buses would be required, involving an initial investment of $25,000.

Prior Preference Stocks Offered.—A syndicate including Otis & Company is offering at $92 per share and accrued dividend to yield 7.61 per cent, $4,000,000 of the 7 per cent prior preference stock of the Continental Gas & Electric Corporation. This company is presently to be a subsidiary of the United Light & Power Company of Grand Rapids, Mich. The United Light & Power Company, through a subsidiary, has recently contracted to purchase more than 75 per cent of the common shares of the Continental Gas & Electric Corporation. The Continental Gas & Electric Corporation is a large utility holding company which controls among other companies the Columbus Railway, Power & Light Company and the Kansas City Power & Light Company.

Third Quarter Better Than a Year Ago.—For the quarter ended Sept. 30, 1924, the United Traction Company, Albany, N. Y., received in transportation revenue $687,125, against $696,940 for a similar period a year ago. Revenue from other railway operations for the same quarters was $20,435 and $22,434 respectively. The total operating expense for the third quarter of this year was $631,987. The net surplus was $75,574. After the consideration of taxes the operating loss was $10,256. The operating loss for a similar period last year was $61,960. The net corporate loss for the third period of 1924 was $130,975. The net loss for the year, up to the close of the September quarter was $205,986. This is $12,452 less than the net loss for the first three quarters of 1923. For the nine months of 1924 the company collected 110,091 fewer passenger fares than for a similar period in 1923. For the first nine months in this year the company operated 3,945,745 car-seat-miles more than for the first nine months one year ago. The number of car-seat-miles operated for the quarter this year was 64,218,392.

Railway Appurtenances Sold—The Southeastern Ohio Railway, operating between Crooksville and Zanesville, Ohio, was sold recently to Henry Goodman. He will dismantle the property. Officials say that bus lines depleted the railway income. Cars have not been running since last May. The likelihood of the abandonment of this 16-mile line has been referred to previously in the ELECTRIC RAILWAY JOURNAL.

Income Increases.—For the quarter ended Sept. 30, 1924, the New York State Railways, Rochester, N. Y., reports to the New York Public Service Commission a net income of $217,774, compared with $205,842 for the similar quarter in 1923.

$7,900,000 Bond Issue on Account of Purchase.—Although the final railway purchase award at Toronto, Ont., calls for $11,448,500, the issue of bonds by the city on account of the railway purchase is for $7,900 000, as the city has already paid $2,500,000 on account, and more than $800,000 is still owing the city by the company in percentages. The terms of the award and the plans looking toward the liquidation of the Toronto Railway have been referred to several times in recent issues of the ELECTRIC RAILWAY JOURNAL. A meeting has already been called having for its object the winding up of the affairs of the company.

Personal Items

Assignments Made in Westinghouse Railway Department

Important changes, involving four division sales managers, have been made in the railway department of the Westinghouse Electric & Manufacturing Company. W. R. Stinemetz, manager of the heavy traction division, and K. A. Simmon, manager of the light traction division, have been appointed assistants to the manager of the railway department. To fill their places, A. J. Manson, manager of the transportation division at New York, has been elevated to the managership of the heavy traction division, as noted in the ELECTRIC RAILWAY JOURNAL for Nov. 22, and E. A. Palmer, manager transportation division, San Francisco office, has been advanced to the managership of the light traction division.

Mr. Stinemetz was graduated from Lehigh University in 1893. He was first employed by the Chicago Telephone Company and the Brooklyn Edison Company. He entered the employ of the Westinghouse Electric Company in 1897, was electrical engineer for power houses of the Third Avenue Railroad, New York, in 1899 and in 1900 was employed by the Westinghouse agents in Mexico. In 1901 he worked on the electrification of the Boston Elevated Railway and later launched the single-phase road of the Atlanta Northern Railroad. He then spent two years supervising the installation of single-phase railroads in France for the French Westinghouse Company and still later was engaged in installing the electrical equipment in the power house which supplied light, heat and power to the United States Capitol. In 1913 he was employed as a commercial engineer in the railway department of the Westinghouse company and several years ago was made manager of the heavy traction division of the railway department.

Mr. Simmon entered the employ of the Westinghouse company upon his graduation from the University of Minnesota in 1905. He attracted attention through the development of train-heating boilers for the New Haven locomotives. Railway control was his special work for some time and he became head of the railway control section of the railway engineering department in 1914. Four years later he became section engineer in charge of light traction motors and control in the railway engineering department. In 1921 he was appointed manager of the light traction division.

Mr. Manson's career was reviewed in the issue of the ELECTRIC RAILWAY JOURNAL for Nov. 22.

Mr. Palmer served with the Public Service Railway, New Jersey, upon his graduation from Cornell University in 1909 and was appointed assistant superintendent of the Plank road shops in 1911. Three years later he was made division master mechanic of the Central Division in Elizabeth, N. J. He held this position until 1916, when he entered the employ of the American Brake Shoe & Foundry Company as mechanical expert. He was engaged by the Westinghouse company in 1917 and was assigned to the railway department of the San Francisco office.

T. R. Langan, manager of the transportation division at the Buffalo office, has been appointed manager of the transportation division at the New York office, to succeed Mr. Manson.

Mr. Ainey Heads Commissioners

Chairman of Pennsylvania Body Elected President of National Body at Phoenix Meeting

W. D. B. Ainey was elected president of the National Association of Railway & Utility Commissioners at the recent annual convention in Phoenix, Ariz.

W. D. B. Ainey

Mr. Ainey is chairman of the Public Service Commission of Pennsylvania. He was appointed to that body by Governor Brumbaugh in 1915 and three months later he was made chairman. Mr. Ainey performed the duties of this office so capably that in 1917 he was reappointed for a 10-year term.

Mr. Ainey is very well known among utility men operating outside of his own state. He has been a frequent attendant at the conventions of the utility managers and was one of the speakers at the Midyear Meeting of the American Electric Railway Association in Indianapolis in 1922. His subject at that time was "A Commissioner's Viewpoint on Some Electric Railway Problems." According to Mr. Ainey, it is in the management and in the management alone that there is to be found the solution of the utility problems of the country. He has said publicly that in so far as the public utilities are concerned it should be the policy of the law not to permit managerial responsibility to be avoided, but that responsibility without authority to make itself effective is vain.

Mr. Ainey's principal interest lies, of course, in Pennsylvania, but he has long been a national figure. He was elected to Congress in 1911 and was there four years as a member of the Sixty-second and Sixty-third Congress. His election to this office was a tribute of his constituents toward the man. That his legal attainments have been given wide recognition is evidenced by the numerous occasions on which he has served as a delegate to international gatherings, including the Inter-Parliamentary Conference in Geneva, Switzerland, in 1912 and the Hague Conference in 1913, where he was made secretary of the Japanese-American groups of parliamentarians. In 1914, on the invitation of the Imperial Parliament, he visited Japan as a delegate from the United States.

Mr Ainey is a native of New Milford, Pa. He was graduated from the law school of Lehigh University and was admitted to the bar in 1887.

Duties Reassigned in Schenectady

Changes in the personnel of the Schenectady Railway, Schenectady, N. Y., include the names of Messrs. Witherwax, Nellis and Palmatier.

C. J. Witherwax, for some years past connected with the company as general passenger and freight agent, has resigned his position, effective Nov. 24, to engage in other business. When he took over the management of all special car movements, excursions and the investigation of irregularities in service about ten years ago his office was a new one with the company. Later he was appointed claim agent. Prior to his connection with the railway he was associated with the Schenectady Illuminating Company and the Mohawk Gas Company.

J. G. Nellis, who was appointed superintendent of the Schenectady Railway on Oct. 15, 1924, takes charge of the traffic department in addition to his other duties, vice C. J. Witherwax, resigned. Before going to Schenectady Mr. Nellis had been superintendent of the Auburn & Syracuse Electric Railroad and prior to that a division superintendent with the Fonda, Johnstown & Gloversville Railroad at Amsterdam, N. Y. The activities of both Mr. Witherwax and Mr. Nellis have been referred to previously in the ELECTRIC RAILWAY JOURNAL.

Frank Palmatier, who for many years past has been superintendent of power for the Schenectady Railway, has had his duties enlarged so as to have charge of both power and overhead lines.

Douglass Ford, superintendent of the North Branch Transit Company, Bloomsburg, Pa., has resigned, effective Dec. 1, to become general manager of the Trenton, Bristol & Philadelphia Street Railway, which is in process of merger with the Frankford, Tacony & Holmesburg Street Railway and the Pennsylvania & New Jersey Railway. The headquarters will be located at Bristol, but may be moved when the merger is completed.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Hoover Reviews Economic Progress

Outstanding features of the fiscal year ended June 30, 1924, were, according to Herbert Hoover, Secretary of Commerce, first, the advance in agricultural prices, which have lagged behind industrial prices for the last four years; second, the beginning of sound economic policies in German reparations, leading to a hopeful measure of economic recovery in Europe, and, third, the recovery of our own industry and commerce, great stability of prices, high production, full employment, expanding foreign trade and prosperity throughout the business world.

A slight slackening in production at the end of the year is indicated by the fact that the index for manufacturing output for June was 15 points below the average for the fiscal year, that for railway ton-mileage was 13 points below, for building contracts 6 points and for employment in factories 7 points below. Subsequent recovery is shown by the September indexes, which for manufacturing production stood thirteen points higher than in June, for mineral production nine points and for forest production one point higher.

Financing Machinery Purchases

A new method of financing the purchase of machinery has been developed by the Industrial Equipment Corporation of America, New York City. The proposed plan resembles in many ways railway equipment trust financing. Certain kinds of machinery are standard with certain industries and possess a substantial resale value. Figures obtained from dealers in second-hand machinery indicate that the cost of removing such machinery does not average more than 5 per cent of the original cash value. Moreover, the rate of depreciation on such machinery is not particularly high. These factors have made possible the new financing arrangement.

Under the usual railway equipment plan the equipment is purchased from a manufacturer and either leased under the Philadelphia plan or sold under the conditional sale plan. The user pays a sufficient rental to meet the face value and dividends in the first case, or the maturing principal and interest in the second case, as they become due. Title to the equipment is vested in a suitable trustee during the life of the trust and each unit of equipment bears evidence of the ownership of the trustee in the form of a metal plate or some other conspicuous designation.

In financing the purchase of machinery the lease plan will be the procedure employed. Through the application of this method there is no possibility of the borrower obtaining title to any of the equipment pledged. Depreciation can readily be taken care of through an arrangement of serial maturities during the life of the trust.

This idea is not entirely new as purchases of other than railway equipment have been financed in the past in a similar manner. In fact, the beginning of the so-called railway equipment financing was not accomplished by a railway company at all, but is said to have taken place about 1845 when the Schuylkill Navigation Company desired to purchase some barges. Other instances of the application of this principal to the purchase of other material than locomotives and cars have occurred at various times. Machinery has been sold on the conditional sale plan to manufacturers and other types of industrial improvements have been financed through the recording of chattel mortgages and the issuance of serial installment payments against them. These transactions, however, have been more or less individual in nature and no successful effort has heretofore been made to develop the broad possibilities of the project as conceived by the organizers of the present corporation.

Lumber Prices Have Doubled in 50 Years

An interesting fact in connection with average lumber prices during the past 50 years is that between 1874 and 1904 there was comparatively little variation. Beginning in 1905, however, there was a steady rise, interrupted only by one marked recession, until 1920, which was the peak year. Then followed a slight decline, but the average so far for 1924 is almost as high as for 1920.

The lumber prices shown in the accompanying table from 1874 to 1909, inclusive, are for long-leaf yellow pine boards, 1x12 in.; from 1910 to date for long-leaf yellow pine timbers, 3x12 in.; all per thousand feet, board measure, in approximately 20-ft. lengths at New York, N. Y.

In 1912 pine lumber prices had reached a point not touched again until 1918. The slump, which occurred meantime, reached the lowest point between 1914 and 1915. It was caused by the opening of the Panama Canal, when Douglas fir shippers on the West Coast could send the lower priced lumber through to the Atlantic seaboard in competition with Southern pine.

Year	Price	Year	Price
1874	$26.00	1900	$24.50
1875	21.00	1901	17.50
1876	21.00	1902	21.00
1877	20.00	1903	23.50
1878	20.00	1904	21.50
1879	20.96	1905	24.92
1880	19.00	1906	29.33
1881	19.00	1907	30.50
1882	19.00	1908	30.50
1883	19.00	1909	33.04
1884	19.00	1910	36.00
1885	18.66	1911	36.00
1886	19.00	1912	40.00
1887	19.00	1913	35.25
1888	16.75	1914	29.50
1889	20.31	1915	27.75
1890	21.75	1916	32.62
1891	18.00	1917	37.33
1892	18.50	1918	42.66
1893	8.50	1919	50.87
1894	18.50	1920	63.73
1895	16.92	1921	48.16
1896	16.42	1922	47.05
1897	16.44	1923	55.22
1898	15.75	1924	58.00
1899	16.25		

Metal, Coal and Material Prices

Metals—New York	Nov. 25, 1924
Copper, electrolytic, cents per lb.	14.00
Copper wire base, cents per lb.	16.25
Lead, cents per lb.	8.80
Zinc, cents per lb.	7.25
Tin, Straits, cents per lb.	54.50
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.275
Somerset mine run, Boston, net tons	2.075
Pittsburgh mine run, Pittsburgh, net tons.	1.875
Franklin, Ill., screenings, Chicago, net tons	1.475
Central, Ill., screenings, Chicago, net tons	1.30
Kansas screenings, Kansas City, net tons.	2.30
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, N. Y., cents per lb.	17.25
Cement, Chicago net prices, without bags.	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.10
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.152
Turpentine (bbl. lots), N. Y., per gal.	0.84

Growing Machine Tool Market

Machine tool makers are beginning to visualize the market ahead for them among the electric railways now operating buses. A good market exists for machine tool equipment of a type not now needed in the strictly railway shop. Some 2,000 buses are now being operated by the railways, and the number is growing rapidly. Garage installations of sizes varying from that needed for taking care of repairs on a few buses to that for several hundred are of almost daily occurrence.

In these shops in varying degree there will be installed lathes, drill presses, brake relining machines, chain hoists, cylinder boring and honing tools, portable drills and grinders, ball bearing jacks, gear type jacks, heavy duty dolly jacks, universal bench saws, wheel pullers for light duty and wheel pullers for heavy duty. This list includes some things that are not machine tools in the strictest sense, but all come under the general head of labor-saving machinery.

Each extension of the use of the bus means a direct need for the installation of machine tools by the railways. The electric railways are not equipped with the types of machine tools needed for garage work, even if they were inclined to attempt to turn their present equipment to such use. They must buy new equipment of one kind or another.

Moreover, the present is a most propitious time for just such buying. For a long time now the machine tool market has been more or less flat. True, it is improving, but when a large company like Niles-Bement-Pond feels called upon for the first time since 1899 to pass the payment of the dividend on its preferred stock a pretty good criterion is furnished of the extent of the period of readjustment through which the machine tool industry has been passing since the war. The management very frankly stated publicly that the business had not been profitable for the last three years.

Burned Carhouse to Be Rebuilt

On Nov. 21 fire destroyed the carhouse and 10 cars of the Schuylkill Railway, located at Girardville, near Mahonoy City, Pa., with a loss of $150,000. The fire for a time threatened the entire plant of the company and interrupted trolley service throughout the northern end of the county for 5 hours. It has been announced that the buildings will be rebuilt. The company is considering the question of replacing the rolling stock which was destroyed.

Rolling Stock

Illinois Central Railroad has decided on certain details of the 215 new cars which it has ordered, as mentioned in ELECTRIC RAILWAY JOURNAL for Nov. 22, page 905. Of this order 130 will be motor cars built by the Pullman Car & Manufacturing Company and 85 will be trailers built by the Standard Steel Car Company. General features of the motor cars are given in the accompanying table.

Builder of car body	Pullman Company
Type of car	Passenger motor
Seating capacity	81
Estimated weight:	
Car body	57,000 lb.
Trucks	33,000 lb.
Equipment	35,000 lb.
Total	125,000 lb.
Bolster centers, length	47 ft. 9 in.
Length over buffers	72 ft. 7½ in.
Truck wheelbase	8 ft. 0 in.
Width over all	9 ft. 9¾ in.
Height, rail to roof	13 ft. 0 in.
Body	Steel and aluminum
Interior trim	Aluminum
Headlining	Agasote
Roof	Monitor
Air brakes	Westinghouse type PS
Control	General Electric type PC
Destination signs	Hunter
Gears and pinions	With motors by manufacturer
Journal bearings	Plain
Lightning arresters	General Electric
Motors	Westinghouse and General Electric specials*
Seating material	Rattan
Slack adjuster	American
Trolley	Pantograph
Wheels	Rolled steel 38-in.

*Motors—inside hung 4 per car—250 hp. two motors in series on 750 volts.

The trail cars will differ from the motor cars in weight and in size of wheels. Estimated weights for these cars are as follows: Car body, 57,000 lb.; trucks, 26,000 lb.; equipment, 1,000 lb.; total, 84,000 lb. Trucks will be built by the Commonwealth Steel Company and will be equipped with 33-in. rolled steel wheels. Additional details concerning these cars and the motor cars will be published as soon as the company has decided upon them.

Connecticut Company, New Haven, Conn., has just received four White buses.

Pittsburgh Railways, Pittsburgh, Pa., last spring let a contract to the Standard Steel Car Company for the construction of 125 cars, as mentioned in the ELECTRIC RAILWAY JOURNAL, issue of May 10, 1924. These are now being built at the plant of the Osgood-Bradley Car Company, Worcester, Mass., for the account of the Standard Steel Car Company.

Grays Harbor Railway & Light Company, Aberdeen, Wash., recently purchased two double-truck light-weight safety cars, representing an investment of $25,000, and completing the $60,000 improvement which the company has made in 1924. The cars were built by the American Car Company of St. Louis, and each has a seating capacity of 52. They will be used to meet the traffic demands on the line between Aberdeen and Hoquiam.

Tennessee Electric Power Company, Chattanooga, Tenn., includes in its budget for 1925 $100,000 to be expended on track improvements in Chattanooga and the reconstruction of rolling stock. A large part of this amount will be used to rebuild 30 of the most modern cars now in service. These will be equipped with complete safety car service.

Illinois Power & Light Corporation, Chicago, Ill., has placed an order with the Yellow Coach Manufacturing Company for six type Z, 29-passenger, single-deck buses. These buses will have 6-cylinder engines and will be used in the city service at Peoria, Ill.

San Antonio Public Service Company, San Antonio, Tex., has purchased one type Z, 4-cylinder, 29-passenger, single-deck bus from the Yellow Coach Manufacturing Company.

Department of Street Railways, City of Detroit, has received offers from three bus manufacturers who are willing to supply buses on the rental plan proposed by the city. These are Dodge Brothers, Yellow Coach Company and Mason Motor Truck Company.

Power Houses, Shops and Buildings

Grand Rapids Railway, Grand Rapids, Mich., has awarded the contract to F. W. Burgstahler & Sons, Grand Rapids, to rebuild its Hall Street carhouse, which was recently destroyed by fire. The general contract price is given at $33,450.

Track and Line

Los Angeles Railways, Los Angeles, Cal., has reconstructed Central Avenue track from Fourteenth Street to Slauson Avenue.

Chicago Surface Lines, Chicago, Ill., has opened up its 1½-mile extension to the Hegewisch, Ill., plant of Henry Ford. The South Chicago Chamber of Commerce took over the sale of bonds covering the cost of the extension. The new line runs through Prairie on Torrence Avenue from 112th Street to 124th Street.

Boston Transit Department on Nov. 25 opened bids for the building of the first section of the work of making the Shawmut Avenue branch of the New York, New Haven & Hartford Railroad into a branch of the Boston Elevated Railway. This section includes the extension of the Dorchester subway at Andrew Square and the building of an incline to the New Haven tracks. The contract has not yet been awarded, but the bids are as follows:

Reynolds Brothers, Inc.	$1,074,295
Simpson Brothers Corporation	1,033,520
C. & R. Construction Company	1,019,930
Martin F. Gaddis	1,013,610
A. G. Tomasello & Son	991,160
Coleman Brothers, Inc.	969,530

Trade Notes

Lindsley Brothers Company, New York City, N. Y., pioneer operators in the Northwest since 1896 in Western red cedar poles, has recently established a New York office at 150 Nassau Street, in charge of Walter E. Mitchell as Eastern representative. Mr. Mitchell has been engaged in the pole business in the East since 1904.

Gibb Instrument Company, Bay City, Mich., has changed its name to Gibb Welding Machines Company. This is a change in name only and denotes no change in organization. As the company no longer makes instruments, but is engaged exclusively in the manufacture of electric welding and heating machines, the new name was adopted as more exactly descriptive of the product.

New Advertising Literature

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has just issued a new edition of its publication "Cars and Car Equipment." This is a 20-page book, 8½ in. x 11 in., resembling in a general way the book published under the same title in 1920 by this company. Service performance, general data, weights, dimensions and information on electrical equipment and mechanical equipment, together with photographs and floor plans, are included for fifteen different cars. These include the light-weight cars of the Boston Elevated, Eastern Massachusetts, Lewiston & Reedsville railways, the Cincinnati and Wheeling traction companies and the North Shore Line. Moderate-weight cars of the Brooklyn City Railroad, Los Angeles Railway, and New Orleans Public Service, Inc., are shown. Suburban and interurban cars pictured are those of the Monongahela-West Penn system, Ohio Valley Electric Railway, the Indianapolis & Cincinnati Traction Company. A multiple-unit car of the Chicago elevated is also included.

American Rust Proof Company, New York, N. Y., has issued a 15-page pamphlet called "Rust and Rust Prevention." It describes the preservation of steel from rust by Vatu.

Barber-Greene Company, Aurora, Ill., has issued an attractively illustrated 25-page pamphlet called "Snow Insurance." Detailed specifications of the Barber-Greene snow loader are included and stories of its successful operation in many cities in the country. In addition, the pamphlet explains the practical solution of snow removal, stressing the great cost to the merchant, the community and the street railways where snow is allowed to remain unremoved. It states that the record of the New York car lines shows that $1,000,000 was lost in fares in the winter storms of 1919.

Ohio Brass Company, Mansfield, Ohio, has issued an illustrated 30-page booklet called "Trackless Trolley." It contains descriptions of overhead materials, current collection equipment and bus equipment.

A Background of Forty Years for Future Building

By HARRY L. BROWN
Editor Electric Railway Journal

FORTY years ago last month—in November, 1884—the first issue of the magazine that has since become the ELECTRIC RAILWAY JOURNAL made its way to the youthful but vigorous street railway industry. Then, as ever since, the paper was presenting information on those subjects and problems in which there was most interest on the part of the men responsible for what was destined to become a great public service. Those were the days when the street railway was not a necessity but a convenience, and the managements had to offer inducements to get the people to ride. Selling transportation was then as live a topic as it has come to be once more in recent years. Aside from the more general aspects of the street railway business, the early issues of the JOURNAL treated its technical aspects, and these at the time had largely to do with horses, harness, colic cures, feed cutters, grooming machines and the like.

Even at this early date, however, improved methods of operation had a prominent place in the paper. The cable drive was then rapidly coming to the front to give a faster and more economical service. Electricity as a motive power was frequently touched upon. While at the beginning of the paper electricity was looked on merely as an experiment, it was soon visualized by the editors as the future means of propulsion for all street railways, and the paper became its active champion. General opinion at the time, however, was in favor of the cable.

Thus the whole story of the industry, its struggles and successes, its mechanical development, its financial and accounting difficulties, its relations with public authorities, its progress in solving these many problems, little and big—all have been recorded for the benefit of the field in the pages of this paper. It has not mattered that hay motors gave way to electric motors, that rope traces gave way to gears, feed cutters to rotary converters and colic cures to shop equipment; the JOURNAL has kept pace. Indeed it has been a significant factor in leading the way. Through these 40 years of transition and of enormous growth in the business of urban and interurban transportation, it has labored continuously in the interests of the industry. Through most discouraging days it has stuck by the industry and steadfastly maintained that a utility so essential could not perish. It has suffered financially with the reverses in the industry, for it prospers or declines with the industry. Which is to say that the JOURNAL is part and parcel of the industry, its champion, its critic when criticism is helpful, and above all, its informant—the "bible of the industry," as is often said.

With this number, the JOURNAL commemorates its fortieth anniversary. Its history, in bare outline, is published in the following pages. Interesting as this is, it does poor justice to the history that is disclosed by going back through the 64 volumes that compose its record. To one who is intensely interested in the industry today, here is a pastime of genuine pleasure.

Going back to the very first issue, whose front cover masthead is reproduced on the second succeeding page, it is interesting to note that six pages of the total of 24, including advertisements, were devoted to news of the American Street Railway Association which had recently been organized. Thus the JOURNAL has always been an enthusiastic supporter of association activities.

From the start, the paper has featured progress and new methods—modernization. For progress is essential in an industry that not only is a direct impetus to great growth in the population of cities, but which must itself keep pace with the increasing demands upon it due to this very growth.

Think what it would mean, for example, if present-day traffic had to be handled by horse cars. The industry would have to possess more than 1,000,000 horses and mules. The Chicago Surface Lines alone would have to have some 40,000 animals. Picture the stables for housing such a herd, the small army of hostlers to take care of them, and the scores of "white wings" required on the streets. Then you take a keener interest in the discussions of the "Refined Habits of the Louisville Street Railway Mule" that found space in some of the early issues.

It is also interesting to find that the JOURNAL has treated the street railway as an essential part of a city from the very first. We find this comment in an editorial in the issue of May, 1885:

> Without this cheap and convenient system of internal transportation, working within and in co-operation with the other greater or lesser divisions of labor, the modern city could not exist. Cities of a million population now are few in number and those several cities in the near future with *five million population* would never exist except in the imagination of sanguine and false prophets,

but which by the aid of street transportation will be facts to be learned from the geography of our children.

The JOURNAL was even then building for the future. It started out with a clear vision of the great function of transportation. That vision has been realized over and over, but it has constantly expanded. Now, with the new, flexible, mobile bus as an added tool, the vision of the transportation industry of the future is again as much beyond its present scope as is the present industry beyond the horse car stage of 40 years ago.

More than of any other individual, this vision of the JOURNAL has been the reflection of the vision and genius of its publisher, James H. McGraw—a great builder of industry. The JOURNAL was his "baby"—his first publication and the beginning of the group which now are produced by the largest industrial and business paper publishing house in the world, of which he is the head. To him, clearly, is industry indebted for having set a new and substantially higher standard of editorial service in such papers. He has never spared expense nor effort to make the JOURNAL, nor any of the other McGraw-Hill publications, of the utmost possible usefulness to their industries. He sees them as among the tools of industry and as such they must be sharp and true and made of the right metal. As he said to the writer, "My whole book of instructions for you is this: 'You cannot make the paper too good to suit me.'"

It is that opportunity without limit to serve the electric railway industry to which the JOURNAL is now, even more than ever before, striving to measure up. It has a background and experience of 40 years to guide its future building. Its purpose will always be to merit the high place it holds in the estimation of the industry.

Prosperity and the Electric Railway

FOUR weeks of a bull market in Wall Street indicate the general impression of prosperous times ahead. President Coolidge in his speech in Chicago on Thursday of this week expressed the same thought, though with a word of caution that prosperity will come only if we work for it. Secretary Mellon makes the same prediction in his annual report, published yesterday, in which he said: "The situation in America looks more favorable for sound and orderly economic development than at any time since the war."

Undoubtedly the electric railway industry should prosper in times of general good business. With general industry active, employees must be carried back and forth to their places of work, and they will have more money to spend for other travel for themselves and their families. Their purchases will be greater, and those railways hauling freight should enjoy more business. As a necessary utility for all classes of people, the gross revenue of the electric railways of the country should increase with prosperous times. At the same time railways may expect an increase in their unit costs, though the inflation of the post-war period is not to be expected, as business conditions, both in this country and abroad, are on a much sounder basis than in 1920.

Of course, the railway industry is very much better fitted to meet any increase in costs than it was in 1914 and 1915. The essential nature of the service which it renders is generally recognized, its equipment for rendering this service is of better design and in much better condition than 10 years ago, and the need for higher fares with increased expenses is generally recognized. A slight increase in the cost of operation, if it comes, need not be a cause, by and large, for worry. But during the period now coming electric railways should watch carefully their expenses as well as their receipts, and if the former with careful management rise unduly they should lose no time in devising some system of fares which will increase the margin of profit.

Modernization Builds Morale

MATERIAL improvement in the morale of the operating and maintenance employees is a certain by-product of real modernization work on an electric railway. Its importance is perhaps as great as the direct results for which modernization is undertaken, namely, economies, better patronage and better public relations. This is just beginning to be realized by the properties which now have their modernization programs well along.

The modernization work on the Eastern Massachusetts Street Railway system, resulting in far better operation at lower maintenance costs, was told about in this paper, page 808, Nov. 8, and discussed editorially on page 830 in the issue for Nov. 15. On this property the management has noticed a most desirable change in the attitude of the employees. Because new equipment has replaced a large part of the old and all equipment put in good condition, the maintenance men think now, when a car comes in, that it is *worth* repairing. They have some respect for it. Also, when a motorman takes a car out, he does so with the feeling that it is a good piece of equipment, not a despicable "pile of junk." He has assurance that it is going to run all day and not have to be pulled in after a few hours.

It is easy to comprehend what such a feeling of confidence in and respect for the equipment, spread over a property, means in the way of improved service, better public relations, more revenue and less expense.

An interesting reflection of the poor morale which results from the opposite situation on a railway was observed the other day. This was on a property where one is almost afraid to ride on the cars for fear they will fall down on his head and where there has not been a new car or a new piece of equipment since the time whereof the memory of the present generation of employees runneth not to the contrary.

A conductor came up to the front end for a word with the motorman while the car awaited the traffic signal. He said to his teammate:

"How's she acting now?" The car had evidently been pulled in that morning and was now on its first trip out of the carhouse again. The motorman replied:

"She's pretty good now. They put a new tip in the controller."

"I'm glad to see *something* new around here," said the conductor.

That remark told volumes about the condition of the property and the indifferent morale of the men. It is virtually impossible to have good morale, a matter of profound importance, on a system that has for many years not had a new car nor any evidence of keeping up to date.

Forty Years of "Electric Railway Journal"

Historical Sketch of the Beginning, Development Policies and Service Rendered by a Publication Which for Forty Years Has Been the Principal Medium for Disseminating News and Technical Information of the Street and Interurban Railways—It Has Striven to Be of Major Service to the Industry Through the Transition from Horse Car and Cable to Electric Car and Recently to Include the Bus

WITH the issues of November this paper, formerly the STREET RAILWAY JOURNAL, completed 40 years of publication service to the street railway industry. It was the first paper in this field. The industry then was already of sufficient magnitude that the need was felt by the men in the field for a medium in which to exchange information and keep them up to date on the inventions and experiments which were the forerunners of important developments soon to come in the street railway industry. There were then some 525 horse railway companies in 300 cities in the United States. Their equipment comprised 16,000 four-wheel cars and 100,000 horses and mules.

In addition there were cable railways in six cities—San Francisco, Chicago, Cincinnati, Kansas City, New York and Philadelphia. Although the cable had been introduced in 1873 in San Francisco, primarily to provide service on the steep hills, its further use had made slow headway. This was principally on account of the excessive cost of installation as compared with the simple track required for a horse railway.

Electric propulsion of cars at this time was hardly more than a dream. The idea had been conceived several years before. A number of purely experimental and exhibition lines had been built in the period dating from 1879. The electric propulsion of cars necessarily awaited, however, on the development of electric generating machinery and of railway motors and control. In fact, looking back now, it seems fair to say that in large measure it was the electrical manufacturers who made possible the great local transportation industry of today.

The first electric street car line to be operated in regular service, that installed in Cleveland by Bentley and Knight, was 2 miles long and had three cars operating on a crude underground conduit. It made its appearance about the time of the STREET RAILWAY JOURNAL, going into service in July, 1884. Thus the JOURNAL may be said to have been born with the electric railway. The installation at Richmond, Va., by Sprague, which is usually referred to as the first practical electric road, did not come along until four years afterward. It, of course, was by far the largest installation up to that time, and more than any other proved the practicability of electricity for car propulsion. The discussions of electric operation in the early issues of the JOURNAL were thus based on the experimental installations.

The founding of the paper was also nearly contemporaneous with that of the American Street Railway Association, and in one of the early issues gave a report of the second annual convention of that association.

This, in a few words, was the extent and nature of the industry when the JOURNAL was started in November, 1884. The first conception of the paper had been the idea of Emerson P. Harris of Chautauqua County, N. Y. He had lifted a street railway department out of the *Journal of Railway Appliances*, a steam railway paper, to create the STREET RAILWAY JOURNAL as a separate monthly publication. This new paper during the first 4½ years was edited by Robert Grimshaw, George L. Fowler and Mr. Harris. It dealt mostly with horses and allied topics and the early transportation prob-

lems, with some articles and discussion on cable installations and electrical experiments.

James H. McGraw, another young man from Chautauqua County, had come with the American Railway Publishing Company, which was the publisher of the *Journal of Railway Appliances, Power* and the STREET RAILWAY JOURNAL, early in 1885. In 1889 he purchased the STREET RAILWAY JOURNAL and started his own company. Mr. McGraw then became editor and manager as well as publisher. This was about the time of the real beginning of electric operation of street railways. While with the American Railway Publishing Company Mr. McGraw had been everywhere that anything new of importance was going on in the industry. He had seen the great value of this intimate first hand contact and observation. So with the STREET RAILWAY JOURNAL as his own, he began editing the paper from the field. This has been the fixed policy of Mr. McGraw ever since all of his present great group of industrial publications.

Besides his personal editorial work Mr. McGraw developed an organization and got enough business in the paper to carry the expense and make possible this extensive traveling and field editing. C. B. Fairchild, Edward E. Higgins and Henry W. Blake were the editors whose labors contributed early toward giving the paper a standing in the field.

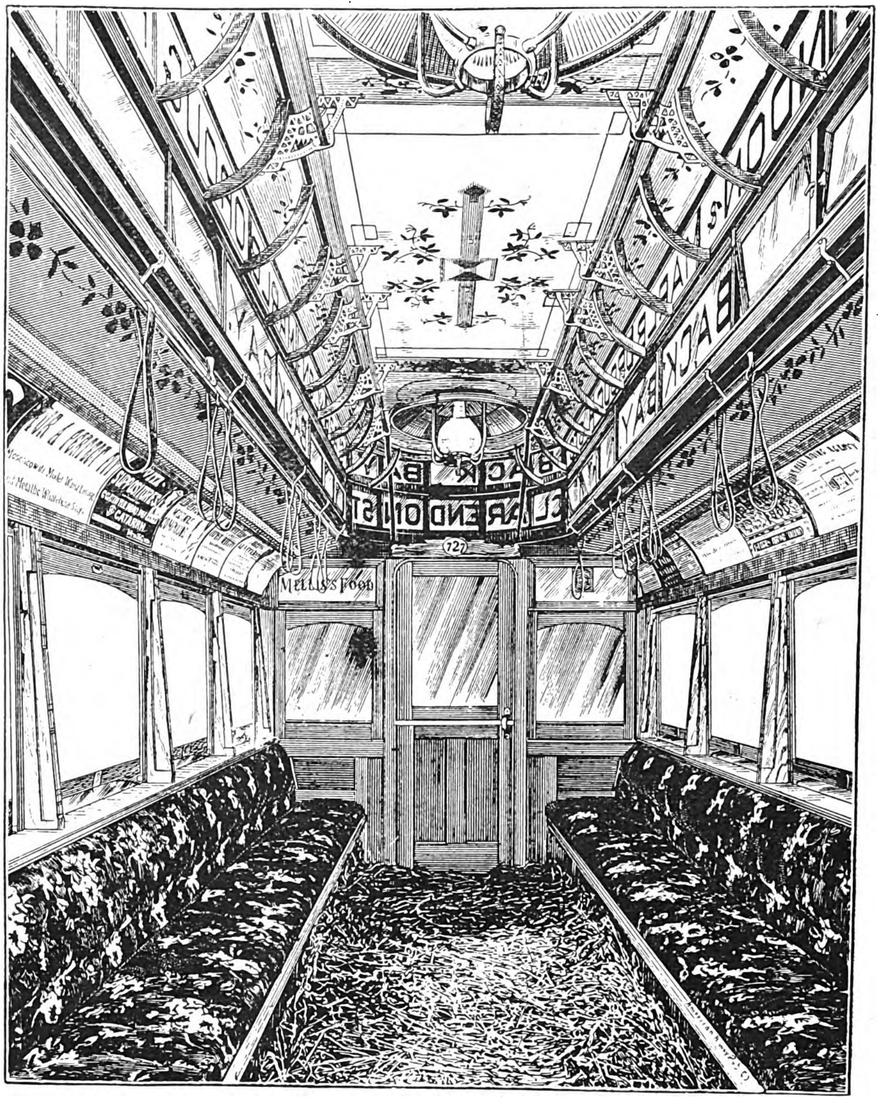
The JOURNAL was newsy and readable and in great demand. It was edited with self-assurance. There was a captivating spontaneity about it and an atmosphere of intimacy with the reader. The service rendered to the American Street Railway Association was invaluable. This consisted in printing notices and full and prompt reports of meetings. The names of association officers appeared in a masthead in every issue.

The first issue contained more than six pages of convention reports. Of its 24 pages, four were occupied with editorials, personals, letters, and fillers. Nearly 13 pages of advertising completed the contents. The first page was occupied with an obituary notice, illustrated with a wood cut of William B. Lewis, who had been president of the Brooklyn City Railroad, which incidentally has the same corporate identity today as then.

In these early issues the name of C. J. Van Depoele was much in evidence, as his company was very active at the time in making installations of electric railways. John Stephenson, the veteran car builder, wrote on the evolution of the street car, in which he had played an important part. Bentley and Knight, whose names are linked with pioneer electric railway work, figured prominently. The opportunity to reach the street railway field through the widely circulated paper was appreciated by Sidney H. Short, Frank J. Sprague, Elihu Thomson, E. J. Houston, J. C. Henry and many others. These men were prolific of ideas regarding the electric motor and its application. Their comments and the articles regarding their inventions made reading of intense interest to street railway men.

Mr. Fairchild, upon becoming editor of the paper, began visiting street railway properties, spending enough time on each really to become acquainted with its problems and its equipment. His researches were promptly reflected in the paper, which showed clearly that it was being edited from the field.

One of his first ventures was a series of talks with electric railway men, in which he used the dialogue form of reporting. He began in July, 1889, with C. D. Wyman, vice-president Central Park, North & East River Railroad. The "talks" made a big hit and were continued for some time. Mr. Fairchild wrote



An Elaborate Wood Cut from the Cover of the Street Railway Journal of June, 1886. It Shows the Interior of a New Car of the Metropolitan Railroad, Boston. The Cut Was Used in Subsequent Issues in an Advertisement of the United States Steam and Street Railway Advertising Company, Ltd.

from the field fully illustrated descriptions of electric railway conditions in many important cities. These studies were unique and their thoroughness commended them. They were voluminous but easy to read and were of great service to the industry. During 1893 and 1894 all but four states in the country were visited and their railways studied in detail.

Mr. Fairchild had not been traveling long among street railway properties before he discovered a need for some kind of a systematic textbook in this field. The scattered railways needed a foundation of information as to best practice if they were to progress without making costly mistakes. He undertook to furnish it. He began in the JOURNAL in 1890 a series of copyrighted articles on street railway practice, later published in book form with the title: "Street Railways; Their Construction, Operation and Maintenance." As one of the earliest books on practical electric railway construction and operation, this proved to be a splendid piece of work which was widely read and highly appreciated by the industry.

Mr. Fairchild's principal contribution to the paper during his 6-year connection with it was that he brought it into personal contact with the leaders of the industry. These 6 years comprised the period of most rapid electrification of the horse, steam and cable street railways. He watched this process not at long range from the office, but on the ground. Although not a railway man by training he was able to sense the problems that confronted the men who were doing pioneer work in transportation.

It was in 1891 that the first "Souvenir" issue of the JOURNAL appeared. This was a supplement to the paper, issued in advance of the A.S.R.A. convention. Its purpose was to prepare the way for the convention.

As to editorial contents, the main feature of the "Souvenir" was a group of articles regarding the convention locality, each of the many railways in Pittsburgh and Allegheny being covered. This practice has since been followed in what later were designated as "Convention Issues" rather than "Souvenirs," whenever the convention has been held elsewhere than at a pleasure resort. There was also a history covering the 9 years of the association, articles regarding leading manufacturers, a list of exhibitors containing 117 names, and a membership list of the association.

MR. BLAKE JOINS THE STAFF

When Henry W. Blake came with the JOURNAL in January, 1891, as assistant to Mr. Fairchild, he added an element to the organization that it had not had before. He had had unusual educational advantages. He had graduated from the Sheffield Scientific School of Yale University in 1886, in civil engineering, and had followed his Yale course with one in electrical engineering at the Massachusetts Institute of Technology, finishing it in 1888.

After graduation, Mr. Blake had been connected with the Sprague Electric Railway & Motor Company, for which he handled advertising and publicity. This work naturally brought him into contact with the trade press of that day, and he became acquainted with Mr. McGraw.

Mr. Blake co-operated heartily with Mr. Fairchild in the endeavor to make the paper practical. He was the natural successor of Mr. Fairchild when the latter left the paper in 1894.

Studies in Electric Railway Economics

BY 1893 the STREET RAILWAY JOURNAL was so firmly established and had made so creditable a record for itself that it was ambitious to render even greater service to the industry than it had done theretofore. The opportunity developed through the appearance on the scene of Edward E. Higgins, who after some 7 years experience with several manufacturing companies traveled extensively abroad. On returning home he opened a consulting engineering office, but soon after, in 1893, joined the staff of the Journal as co-editor.

He had already begun the preparation of a series of articles on street railway investments. These were published in the Journal, beginning in the January, 1894, issue. They were a notable contribution to a new subject and attracted wide attention. Later, these articles were published in book form.

While the articles were coming out, the preparation of a financial manual was also under way. It first appeared in June, 1894, as a supplement to the Journal. At first it carried the title "American Street Railway Investments," but it later became the "McGraw Electric Railway Manual." The supplement was bound in cloth of a brilliant red color, from which it soon became known as the "Red Book," a nickname which continued through its 21 years of existence.

The "Red Book" contained much financial information that was not available elsewhere, even including subdivided operating data when such were available. In the first issue there were reports of more than 1,000 railways operating in about 600 cities and towns.

The consolidations that were going on as horse car lines were bought up extended their range and made the financing less and less a matter of local concern. Large sums of money were needed and it became necessary to go to outside investors for funds. This naturally made a field for the "Red Book," which stepped in to help sell the idea of the electric railway as a desirable investment field.

Mr. Higgins continued as co-editor of the Journal until 1900, when he retired to enter the general publishing field. He was with the paper during the period when his expert knowledge was most needed, that is, during the constructive, speculative period of the business.

The "Red Book" which he started was continued after he left the Journal, as long as there appeared to be a field for it. It was discontinued with the volume for 1914.

Real Newspaper Service Started

As far as the style of the contents went the Street Railway Journal was newsy from the start. It went as far as a monthly publication could go in furnishing news, but in its first decade there was not the pressure upon it for prompt news service that came about in the middle '90s. By this period the street railway business was booming. The incorporation of new companies was of frequent occurrence, and enormous quantities of supplies were being purchased. So the Journal publishers felt it incumbent upon them to provide news service of a more comprehensive nature.

The first step was the issuing of a daily business news bulletin for the benefit of advertisers and prospective advertisers. This put the facts promptly before those who could most immediately benefit from knowing them. Information for the news bulletin was secured from local correspondents, by the editors, etc. The more permanent items of news used in the bulletin were salvaged for insertion in the regular issues of the Journal.

Experience with the news bulletin, and the desire of the publishers to improve the news service furnished to all subscribers, led, in June, 1899, to the issuing of a weekly supplement, devoted entirely to news. This was continued to the end of the year, when it was incorporated with the paper as a regular feature. With the issue of Jan. 6, 1900, the Street Railway Journal became a regular weekly.

CITY RAILROAD

Another Type of Motive Power Advertised in the Issue of January, 1886

During the first month the first issue of the paper contained 66 text pages and the others 12 each, but gradually the news issues increased in size and finally all issues became uniform. The news section, however, was printed in a definite place in the paper, thus continuing in a way the identity of the news issue.

Special Attention Given to Foreign Practice

While during its first decade the Street Railway Journal was growing in influence among the street railways of the United States and Canada, it also increased in prestige abroad. The practical application of electricity as a propelling power for street railways in Europe lagged somewhat behind that in this country. Although Siemens & Halske had demonstrated that electric cars were practical as early as 1879, it was not until 1894 and 1895 that really active European tramway development took place. In the meantime the phenomenal success of the electric railway in this country was creating abroad a demand for American apparatus, and large quantities were exported.

The Journal had a considerable share in keeping Europe informed as to what America was doing along this line. It was natural, therefore, that the office of the paper was frequently visited by representatives or delegations from Great Britain and the Continent who had been sent here to study American practice. This brought the editors into close touch with foreign developments. Furthermore, the paper had competent foreign correspondents and early established a London office in charge of A. W. Shaw, who served as European manager until 1917.

Messrs. McGraw, Higgins and Blake had traveled extensively in Europe. They were quick to see the desirability of publishing a special European edition which would increase the already large foreign subscription list and render the advertising more fruitful. Such an edition, started in 1897, was a modification of the American edition, some parts of the latter being lifted out and a section dealing with foreign practice being inserted.

The body of the paper was all in English, but to assist the foreign subscribers quickly to gain a comprehensive idea of the contents of an issue, digests of the principal articles were printed in French, German and Spanish. The digest facilitated the use of the paper, as a person familiar with one of the foreign languages was able with its aid to determine whether it was necessary for him to dig into the original article. References to figure numbers in the articles were given in the digest, thus virtually illustrating it.

The foreign edition with the digest was continued for several years, until the increasing familiarity of the Journal's foreign readers with English rendered it no longer necessary.

Journal Becomes More Technical

THAT the STREET RAILWAY JOURNAL was keeping in close contact with its rapidly developing industry was indicated by the increasingly technical, although always practical, nature of many of its articles. From 1895 onward, for, say, 15 years, the progress of electric railways was mainly along engineering lines. Power plants and power transmission, track design and construction, scientific application of motors, and heavy electric traction were features of transportation work which had attracted engineers. The JOURNAL became largely an engineering paper for a time.

An excellent illustration of the work of the paper along engineering lines is furnished by the campaign on train-resistance formulas. Obviously it was essential to designers to know what resistance a car or train would have to overcome at various speeds.

The JOURNAL started with a formula determined by John Lundie, a consulting engineer who had had much to do with the elevated railways in Chicago. The Lundie formula soon became famous through the publicity thus given to it. Experts like C. O. Mailloux, W. H. Blood, Jr., and others brought out the results of their work through the JOURNAL almost as a matter of course. Within 10 years its columns became the repository of most of the writings on the subject, and the paper was widely quoted. All of the early literature on train resistance refers to the JOURNAL as the source of much original information.

The height of the train resistance formula campaign came about 1902, when the soundness of some of the conclusions of the paper were attacked. Mr. Blake was abroad that year and was present at the office of the Siemens-Halske Electric Company in Berlin just as the proof sheets of the report on the famous Zossen high-speed railway tests came in. He was permitted to send some summary sheets to New York for publication long in advance of other publicity. The Zossen results vindicated the JOURNAL'S reasoning and the conclusions were driven home by a series of editorials.

When in 1904 the Electric Railway Test Commission was organized in connection with the Louisiana Purchase Exposition, to utilize the facilities of the exposition for scientific investigation, Mr. McGraw was invited to become one of the five members in recognition of the work which his paper had done in encouraging the laying of a sound engineering basis for railway work.*

The Test Commission produced an elaborate and valuable report which many were anxious to have published in book form. As no one else would finance the printing, Mr. McGraw agreed to do so because he said it had to be made available to the industry.

The JOURNAL also did an important work for the industry along power plant lines beginning back in the early '90s. The rapid expansion of the electric railway business created an enormous market for power-plant machinery, because the railways required power on a large scale and required it at once. Power was not available from lighting plants in the necessary quantities, and of the proper variety for railway use, so that each railway, no matter how small, had to have its own plant. Beginning in 1891 or earlier, articles on power plants and power plant practices became conspicuous. In 1897 the paper secured from a well-known engineer, Dr. Charles E. Emery, a notable series of articles on engines for electric railway power plants. This began in the "Souvenir" issue of that year and continued into the following year. The articles formed a veritable treatise on the subject and were of great value to the industry.

As each important power plant was built for an electric railway property, it was described fully in the paper in order to illustrate the technical advances. From time to time articles of a more general nature were published, including many editorials on all phases of power development.

This continued until, in recent years, electric railways have tended more and more to purchase power from central stations. To secure operating economy, large power plants and super-power plants have been developed to generate electric power on a large scale, distributing it to all classes of customers. The electric railway makes an excellent customer for such a plant, and in many cases can buy power cheaper than generate it. This situation has naturally been reflected in the pages of the JOURNAL, which, of late years, have contained proportionately much less material on this subject.

ACTIVE INTEREST TAKEN IN ELECTRIFICATION

About the time that train resistance had become reasonably well understood, it happened that the electrification of steam railroads began to attract attention. The JOURNAL fortunately was in a position to be of great assistance in this development. The task of disseminating information on heavy traction fell naturally upon the paper because most of the pioneer work in this line was done by men trained in electric railway work.

The application of electric motive power in hauling heavy trains began, in this country, with the electrification of the Baltimore & Ohio Railroad tunnel in Baltimore in 1894, but it was nearly 10 years thereafter before railroad managers became seriously interested. Even then the railroads were very slow to recognize the electric locomotive as a coming thing, and made installations only as necessitated by tunnel conditions. In the meantime the JOURNAL kept hammering away, editorially and by the best of technical news service, to convince transportation men that there was a field for electric operation of trains. That this work was thoroughly done was indicated by the extended use of the paper for reference on this subject. A recent French work on electrification in the United States, as well as American bibliographies on the subject, are replete with references to the paper. From the beginning all important installations have been fully covered and their significant features have been pointed out.

CAMPAIGN FOR PUBLICITY

While, with the industry, the JOURNAL was becoming more technical, the publishers and editors of the paper did not confine themselves to engineering. One thing they early recognized was the need for publicity of electric railway affairs if good public relations were to be preserved. The JOURNAL took a leading position in this matter, far ahead of that occupied by railway managers generally. Editorially and in news articles it preached the gospel of frankness in dealing with the public. Progress was slow, but in time results began to come, especially as public service commissions increasingly required full information to be filed. Now, of course, publicity is accepted as the normal thing.

---

*James G. White was chairman of this commission; H. H. Vreeland, treasurer; Mr. McGraw, secretary; the other members were George F. McCullough and W. J. Wilgus.

In May, 1908, Mr. McGraw purchased from Hugh M. Wilson the only serious competitor of the STREET RAILWAY JOURNAL, the *Electric Railway Review.* With the first issue of June the two papers were combined as the ELECTRIC RAILWAY JOURNAL.

At the time of the consolidation of the JOURNAL and the *Review* the latter was in its eighteenth year. The paper was started in Chicago in 1891 as the *Street Railway Review* by H. H. Windsor, with whom was associated Fred S. Kenfield, Western advertising manager of the STREET RAILWAY JOURNAL. Ten years after the *Review* was started Mr. Windsor sold his interest in the paper to his partner, who organized the Kenfield Publishing Company. Mr. Kenfield in turn sold the property in 1906 to Mr. Wilson, publisher of the *Railway Age,* and left the publishing business.

The *Review* was improved in every way by Mr. Wilson and became an active competitor of the JOURNAL.

When the JOURNAL absorbed the *Review* its staff experienced a welcome increase. In addition the JOURNAL gained several editorial features, including the daily edition issued in connection with the annual convention of the Electric Railway Association and the annual statistical issue.

The Dictionary and the Directory

A FEW months before the JOURNAL took over the *Review* in 1908, Jan. 1 of that year to be exact, the paper had engaged as associate editor, Rodney Hitt, who for nearly 6 years had been connected with the *Railroad Gazette* and who had had valuable experience in compiling and revising several of the railway dictionaries which the Boardman Publishing Company issued in co-operation with committees of the steam railroad associations. Plans were soon laid to publish a similar dictionary for electric railways in co-operation with the American Street and Interurban Railway Association.

As an advisory committee on the proposed dictionary, the association appointed H. H. Adams, New York City; Paul Winsor, Boston, and Richard McCulloch, St. Louis.

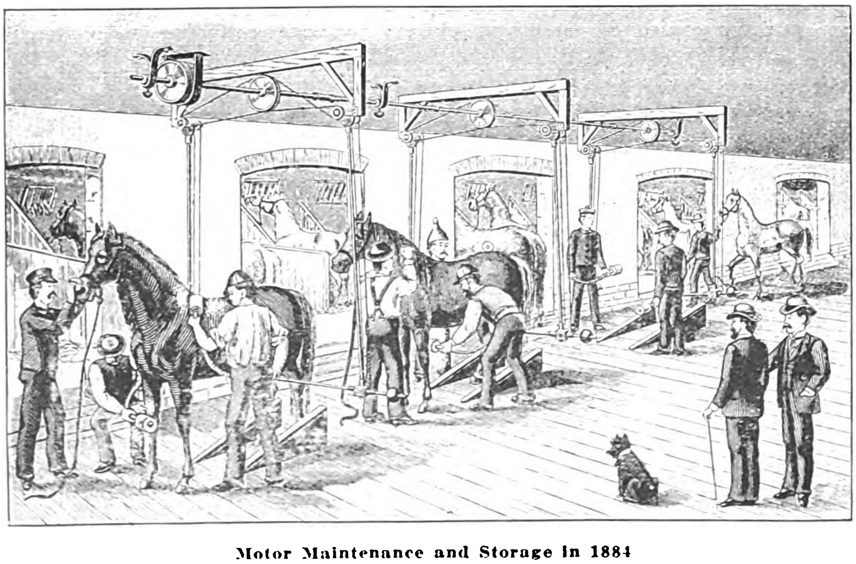
The preparation of the dictionary went along steadily during the ensuing two years, and it was completed during 1911.

The book comprised 355 pages, of which 63 contained definitions to the number of 2,200. The remainder was made up of illustrations—pictures and drawings of cars and parts of cars, with details of equipment. As stated by the committee, the primary purpose of the dictionary was to assist in bringing about standardization of the terms used in electric car building and maintenance. It was an outstanding service of the McGraw Publishing Company to the industry.

The present publication of an electric railway directory was the outgrowth of early work done by the paper. It dates back to June, 1885, for in the issue of the STREET RAILWAY JOURNAL for that month appears an official list of street railways of the United States and Canada. It continued to be printed monthly until June, 1892, after which it appeared only quarterly for a period of 5 years. By 1897 the directory had grown so that it was printed separately in the form of a booklet about 4 in. x 6 in. in size, as a supplement to the paper. This began the second stage of its development. The booklet was not circulated generally, but was printed mainly for advertisers. For each railway it gave the officers, track mileage, and numbers of motor and trail cars. There was no advertising in it. Beginning with the issue for February, 1904, the directory became essentially the McGraw Electric Railway Directory of today, with a page size of 4 in. x 8½ in.

The Journal from 1908 On

SINCE 1908 the most conspicuous single addition to the service rendered by the paper has been the improvement in the field of maintenance. The editors realized that the subject of maintenance had become so important in the eyes of the electric railway operator that they should give it more intense treatment. Consequently, a special maintenance number, the first of the annual series which has continued until the present time, was issued April 4, 1908. In 1913 the number and range of the articles on maintenance were increased and segregated in a special department.



Motor Maintenance and Storage in 1884
Reproduction of a wood cut in one of the early issues of the STREET RAILWAY JOURNAL

This equipment and maintenance section was well received in the field. It resulted in the further development of the maintenance service, by devoting an entire issue each month to mechanical and engineering matters, except for the timely news material which always has the right of way. Such a plan was started with the issue of February 23, 1918. The regular weekly equipment and maintenance department was omitted. Later, the weekly department was restored, supplementing for the weekly subscribers the service furnished by the monthly.

INTEREST IN BUS MATERIALIZES

The JOURNAL early foresaw that electric railway managers should be well informed on motor bus developments. It published articles on the place of the bus and advocated a proper co-ordination of bus and rail service. The paper was in a difficult situation because for the ultimate good of the electric railway industry it had to take an advanced position. The electric railway industry had suffered so keenly from jitney competition that it was in no mood to discuss the subject and in general resented the suggestion that electric railways should operate buses. The paper urged that, as transportation experts, the railways should control a complete co-ordinated system. But not all railway managers believed that buses could be operated at a profit and they hesitated to go into the business. They did not like to see their favorite paper advocating what seemed to them to be a suicidal policy. Yet it was clear to the JOURNAL editors that a great service could be done both the electric railways and the independent bus operators by showing the proper field of the bus and by preaching the principle of helpful co-ordination rather than destructive competition.

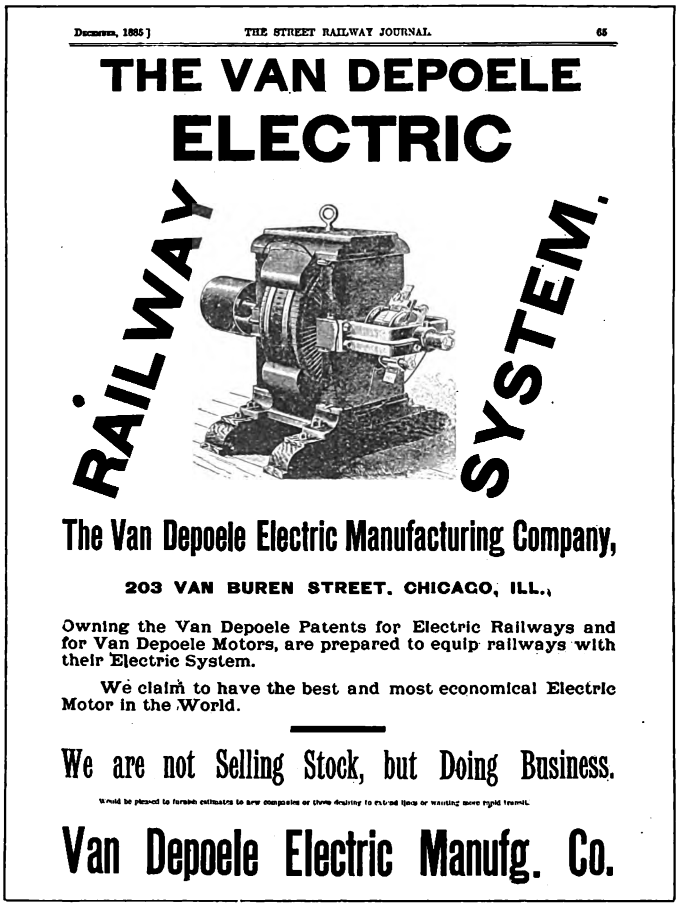
The logical answer could only be a separate paper with a bus appeal, which would reach both the bus operator and the electric railway interested in bus operation. Such a paper, named *Bus Transportation*, was started in January, 1922.

Harold V. Bozell, then co-editor of the JOURNAL was appointed editor of the new paper as well, and Carl W. Stocks, managing editor. Mr. Stocks became its editor on July 1, 1922, when Mr. Bozell was transferred to the *Electrical World.*

The starting of a bus paper by the McGraw-Hill company was considered by electric railway men generally as a wise move. The opinion was not unanimous, however. Without waiting to see how the publishing plan would be worked out, one of the state electric railway associations voiced extreme opposition in a formal resolution.

The JOURNAL continued its plan of treating the bus and opposition to the new venture soon died down. In due course the electric railways began to show a genuine interest in the bus, as was well illustrated at the 1923 and 1924 conventions of the American Electric Railway Association, where bus exhibits were the most conspicuous feature. In fact, several of the railways which objected to the publication of *Bus Transportation* are large users of buses today.

The depression in the industry resulting from the high costs attendant upon the war reacted unfavorably upon the JOURNAL from the business standpoint. Many advertisers stuck by faithfully, even when business was dullest, but the mounting costs of production had the same effect on publishing as on electric railway operation. Retrenchment was necessary, but even though the paper was losing money, the essential editorial service was maintained.



December, 1885.] THE STREET RAILWAY JOURNAL. 65

THE VAN DEPOELE

ELECTRIC

RAILWAY SYSTEM.

The Van Depoele Electric Manufacturing Company,

203 VAN BUREN STREET. CHICAGO, ILL.

Owning the Van Depoele Patents for Electric Railways and for Van Depoele Motors, are prepared to equip railways with their Electric System.

We claim to have the best and most economical Electric Motor in the World.

We are not Selling Stock, but Doing Business.

Would be pleased to furnish estimates to new companies or those desiring to extend lines or wanting more rapid transit.

Van Depoele Electric Manufg. Co.

The First Advertisement of Any Electric Railway Equipment to Appear in the Paper. This Was in the Issue of December, 1885.

SOME CHANGES IN THE STAFF

As Mr. Blake approached the end of a thirty-year period of service, with the JOURNAL, he appreciated the fact that he should have associated with him a younger man of the executive type of mind and trained to relieve him of details. Accordingly, Harold V. Bozell, in February, 1920, became associate editor of the paper. He was promoted to the position of co-editor with Mr. Blake a few months later, but in July, 1922, was transferred to the *Electrical World,* becoming co-editor of that paper with W. H. Onken, Jr.

When Mr. Bozell was transferred to the *Electrical World,* Harry L. Brown, who since 1915 had been first Western editorial representative, then associate editor and later Western editor, with headquarters in Chicago, except for 20 months of military service, was transferred to New York as managing editor. On Jan. 1, 1923, he was appointed co-editor with Mr. Blake and placed in executive charge.

During 1923 the editorial staff was increased with a view to rendering a more practical service to the industry. To permit this, three new men were secured from electric railway properties, Messrs. Charles Gordon, J. A. Miller, Jr., and M. B. Knox, and one from a consulting engineering practice, Morris Buck. G. J. MacMurray and C. W. Squier, in addition to Mr. Blake, also members of the present staff, had been with the paper for a number of years.

As executive editor, Mr. Brown believed that the electric railway industry, with returning prosperity could and would support this more comprehensive editorial service. Mr. McGraw was willing to back him up. The field has responded; the paper has won increased recognition, and the revenue from advertising has grown so that this standard of service can be maintained and improved upon in the future.

"Souvenirs" a Series of Text Books

THE story of the ELECTRIC RAILWAY JOURNAL would not be complete without further reference to the annual which has been published since 1891 just prior to the convention of the American Street Railway Association, later the American Street and Interurban Railway Association, and still later the American Electric Railway Association. The purpose of this publication at the outset was to acquaint the members of the association with the local street railway situation in the convention center, and to give them full information regarding the association officers and their activities.

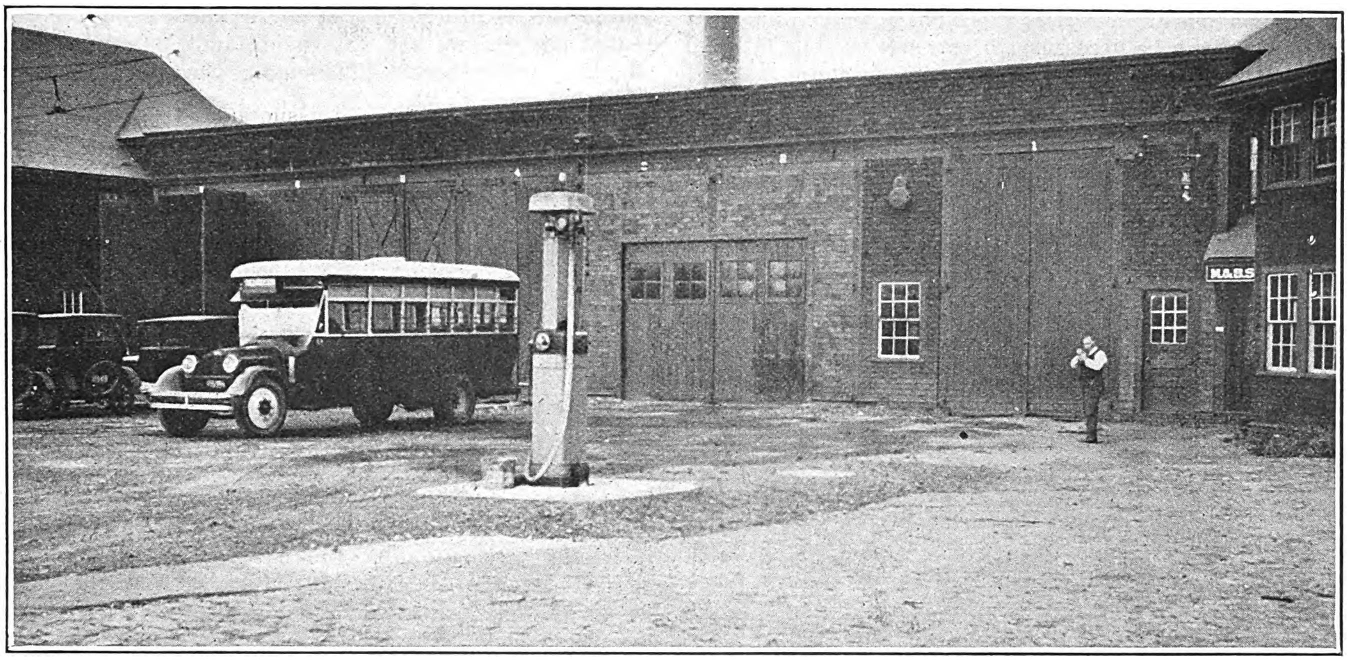
The annual was distributed long enough in advance of the convention to permit those who expected to attend it to receive their copies before starting, and thus prepare them to make the most of their opportunities. Those who remained at home benefited also, through being furnished with unusually complete information regarding railway conditions in a particular section of the country.

The annual was at first known as the "Souvenir," and it was issued as a supplement to the paper. It was printed on stock of finer quality than the regular issues and no expense was spared on illustrations and text preparations. Later, the "Souvenir" became a section of a regular issue, printed and bound separately, but paged so as to bind in its proper place in the volume. Still later, as at present, one of the regular issues was enlarged to accommodate the articles appropriate to the occasion, the enlarged issue being known as the Convention Number.

In 1907 the electric railway association began the practice of holding most of its meetings at Atlantic City, N. J., thus obviating the necessity for the kind of a program which the Convention Issue had provided for 16 years. The plan was changed, therefore, for issues of Atlantic City convention years, at least, to one under which a review was given of the progress made in the art along some lines particularly active at the time. Examples are heavy traction, welfare work, interurban practice, one-man cars, and public relations. The table published herewith gives the full list of subjects.

The Convention Numbers of Electric Railway Journal

Year	Convention City	Contents of Convention Number
1891	Pittsburgh	History of American Street Railway Association—Articles regarding Pittsburgh and Allegheny railways — Articles about manufacturers — List of exhibitors (117) — Membership list of association.
1892	Cleveland	Articles regarding the association and the convention program — Biographies of local committee members— Descriptions of local railways — Manufacturers' section.
1893	Milwaukee	Extended articles on several local railway systems.
1894	Atlanta	Tenth anniversary. Elaborate article on Atlanta — Biographical notes of American Street Railway Association officers and committee members — History of the STREET RAILWAY JOURNAL — Other articles — Totaling 122 pages of text.
1895	Montreal	Electric railway systems of Canada — Long illustrated article on the American Street Railway Association.
1896	St. Louis	Signed articles by experts covering different aspects of local street railways — Statistical study of great street railway properties of America — Progress of the year — Section on new appliances and engineering development.
1897	Niagara Falls	Articles on electric railways of Niagara region — First article of a series by Dr. C. E. Emery on engines for electric railway power stations — Large number of short articles, some signed.
1898	Boston	Articles regarding the local situation and numerous general articles.
1899	Chicago	In addition to articles on local railway situation, electric railway practice in several foreign countries was covered.
1900	Kansas City	International engineering — Besides space given to local situation and to convention, the issue covered railway practices in several foreign countries and included high grade technical articles such as design of large railway generators, by H. F. Parshall; electric railway motors by John Lundie, etc.
1901	New York	More study of local transit situation in all phases, remarkably complete. The leading article was written by Frank R. Ford and contained, so far as is known, the first diagrams ever published, showing the location of cars on a street railway system.
1902	Detroit	Besides featuring the local situation, authoritative articles were given on interurban traction covering many roads. Notable article by Philip Dawson on suburban transportation conditions of London.
1903	Saratoga	While local situation was covered, principal contents were general articles on track, overhead, rolling stock, power equipment, and repair shop methods.
1904	St. Louis	Twentieth anniversary. Besides the local situation, history of the American Street Railway Association was given and the evolution of the industry was covered in a series of articles. Achievements in detail were given year by year and statistics presented in graphical form. There were notable articles on the New York subway, its power plant and distributing system.
1905	Philadelphia	Comprehensive study of Philadelphia street railway systems. New make-up adopted with text and line cuts on rough paper, halftones on coated paper in sections—commercial type face employed. This issue contained the first maps of a street railway published in this country, so far as is known, showing by the width of the lines the normal number of cars passing over that line within a definite period.
1906	Columbus	In addition to articles on the Columbus street railways and neighboring interurban railways, there were excellent articles on rolling stock, generation and distribution of power, carhouses, schedules, freight and express, interurban economics, etc.
1907	Atlantic City	First Atlantic City convention — Railroad electrification issue — All phases of electrification, including maintenance, were taken up — There was a feature article by Philip Dawson on electrical equipment of main line railways in Europe.
1908	Atlantic City	Operating practice — Articles dealt with employment of trainmen, welfare work, train dispatching, tickets and fares, track, overhead, carhouses, repair shops, etc.
1909	Denver	Twenty-fifth anniversary — Tramway situation in Denver covered, as well as interurban railway construction and practice in the West — History of preceding five years covered year by year.
1910	Atlantic City	Development of traffic — Articles took up promotion methods in different parts of the country —.As illustrations had to be scattered through text, coated paper was used throughout — It was lightly tinted in green.
1911	Atlantic City	The Public Service Railway system was exhaustively covered in all departments.
1912	Chicago	An elaborate study of the Chicago properties, going into many phases of their construction and operation.
1913	Atlantic City	Recent progress — The topics thoroughly covered were track construction, power generation, car design, repair shop methods, fare accounting, freight handling, signals and self-propelled cars.
1914	Atlantic City	Public relations — Articles, a number contributed, on three phases of subjects: Meeting the public, operating conditions, and regulation.
1915	San Francisco	Pacific Coast properties — Signed articles relating to various electric railway matters.
1916	Atlantic City	The development of electric railway cars was treated from different points of view.
1917	New York (Conference but no convention this year)	More service at less cost — This issue was devoted to the development of one-man car operation.
1918	New York (Conference but no convention this year)	Issue devoted to four subjects as follows: What war has meant to Canada's lines; How safety cars save fuel and men; British tramways severely affected by war; Disabled soldiers in electric railway service.
1919	Atlantic City	Selling transportation — Means for getting electric railways on a profitable basis, including several articles on the zone system. This was the year of the printers' strike, but the Convention Issue was out just in time to avoid it. The convention report number had to be published in Baltimore.
1920	Atlantic City	Mass transportation — Signed articles by experts on several phases of the problem of handling passengers in large groups.
1921	Atlantic City	Better salesmanship in transportation — The articles show how all departments can help in the sale of transportation, there being articles signed by several experts.
1922	Chicago	Chicago transportation experience—All phases of this subject were discussed by experts in signed articles.
1923	Atlantic City	Trends in car development — An analytical study of the different phases of car design tendencies.
1924	Atlantic City	Modernization — A group of signed articles on the introduction of modern methods into the work of every department of the electric railway, contributed by outstanding men of the industry.

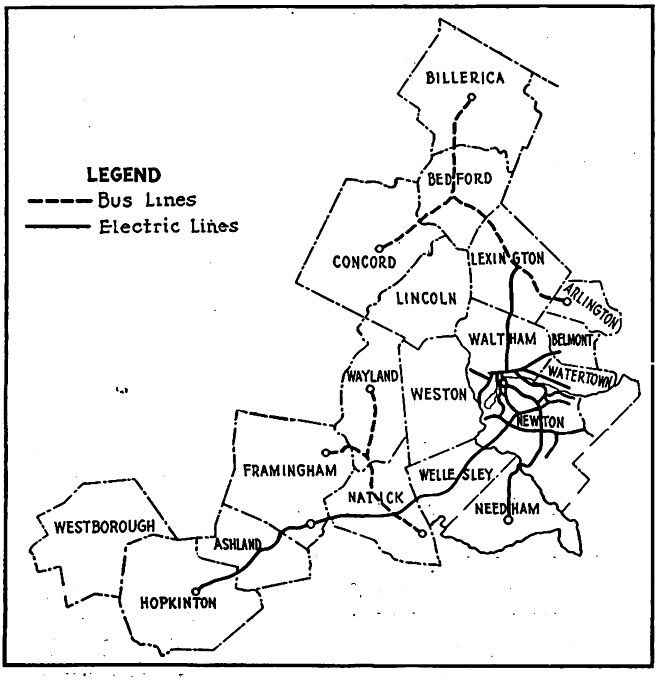


The North Lexington Carhouse Has Been Converted Into a Bus Garage

Buses Run Along Paul Revere's Route

Historic Towns in Eastern Massachusetts Formerly Served by Single-Track Lines of the Middlesex & Boston Street Railway Now Have Bus Service Operated by the Same Company—More Economical Operation Has Been Obtained on Routes Where the Traffic Is Light

LARGE areas in one of the oldest sections of the United States have recently been provided with modern bus service in place of street car service. In spite of its age, however, this district is one which has never been closely built up and the passenger traffic on the railway has always been comparatively light. When it became necessary some time ago to consider the problem of rebuilding several miles of its track, the Middlesex & Boston Street Railway, Newtonville, Mass., determined that under these traffic conditions it would be more economical to undertake bus operation. This has been done with the result that operating costs have been materially reduced without affecting the revenue at all.



Routes on Which Bus Service Has Replaced Car Service in a Historic Section of Massachusetts

The more important of two such routes recently established by the railway begins at Arlington Heights, where connection is made with the Boston Elevated Railway, and runs in a general northerly direction through Lexington and Bedford to Concord and Billerica. These towns are all in Middlesex County and the bus line in part follows the famous route taken by Paul Revere in 1775 when he rode to "spread the alarm through every Middlesex village and farm."

The new bus route follows the old car route from Arlington Heights through Lexington and Bedford. From the latter town one branch goes to Billerica and another to Concord as did the railway. From Billerica to Arlington is 13 miles and from Concord to Bedford is 4 miles, making the total trackage on which car service has been suspended in the last few months about 17 miles.

Formerly, a two-hour street car headway was run from Billerica to Arlington, and a similar two-hour headway from Concord. This gave hourly service between the junction at Bedford and the Arlington terminus. Short trips going only as far as the Bedford town line reduced the headway to a half hour through Lexington. For the most part buses are now operated on the same headway as the cars formerly had, except that on account of the small carrying capacity of the bus as compared with the street car some trips have been "doubleheaded." It is expected, however, that next summer it will be necessary to increase the bus mileage considerably to take care of the heavier riding at that time of year.

The running time is the same as before, except that schedules are better maintained on account of having no turn-out delays. From Arlington to Concord or Billerica the round-trip time is 2 hours, which corresponds with the headway. One bus therefore suffices for each of these services. From the Bedford line to Arlington two more buses are used to supply the half-hour headway required between these points. These four buses are run all day. During rush hours, however, extra trips are run from the center of Lexington, providing a 15-minute headway between there and Arlington. In this area standing loads are permitted.

COLONIAL PHARMACY
LEXINGTON HARDWARE & S

Where Bus and Car Lines of the Middlesex & Boston Street Railway Connect at Lexington

The last car was operated on this route on Sept. 15, 1924, and since that time the traffic has been handled entirely by bus. So far there has been no notable increase or decrease in the number of passengers carried. Fares are the same with the buses as they used to be with the cars. There are three 10-cent zones between Arlington and Billerica and the same number on the branch running to Concord. No fare box is used. Fare is handed directly to the operator when the passenger enters the bus, and its receipt is recorded on an International cash and ticket register. At the end of each fare zone the operator stops the bus and goes through to collect second or third fares. This method of collection is feasible because the second and third fare points are far out in the country and the number of bus passengers is small. Free transfers are issued at Lexington between the railway's cars and buses.

When bus operation was undertaken in this district the North Lexington carhouse of the railway was converted into a garage. The cars which continue to operate in Lexington were transferred to the Waltham division, and are now housed at, and operated from, that carhouse. For greater convenience the swinging doors of the carhouse at Lexington were converted into sliding doors of smaller dimensions, as large entrances were no longer needed. The pits in the carhouse were filled in and the necessary changes made in the tool equipment to permit the repair of the motor vehicles. It is planned in the future to concrete the floor of the carhouse, but this has not yet been done. A gasoline filling station is located in front of this building.

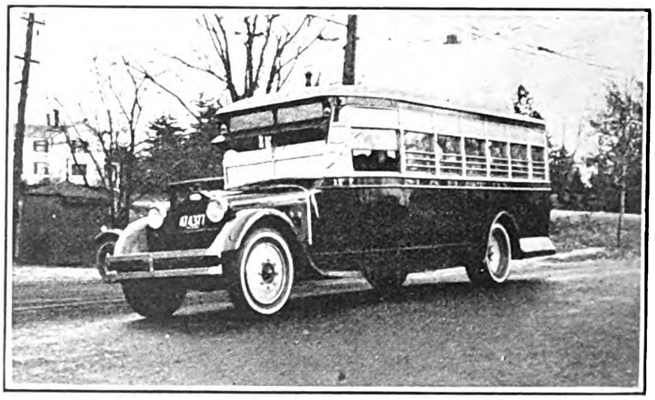
The new automotive equipment of the Middlesex & Boston Street Railway consists of 12 White Model 50-A buses with Bender bodies. Of these seven are at Lexington and five at Natick. Slight modifications have been made in the design of two of the most recently purchased in order to give more knee room for the seated passengers, and to provide additional space for standing passengers. This change has increased the over-all length about 7 in. An interesting feature of the design is a rear bumper which has been put on to prevent damage to the body if the operator backs into a tree, pole or other obstruction.

The four all-day buses operated from the North Lexington garage and three trippers cover altogether about 800 miles per day. Each bus is inspected daily at any convenient time when not needed for service. An experienced auto mechanic who formerly was connected with the White Motor Company in Boston has been engaged to supervise bus maintenance for the railway. The fact that the White company maintains a large and well-equipped service station in Boston has been helpful in reducing the amount of repairs which it is necessary for the railway to take care of in its own shop.

Various kinds of tires have been tried to determine which is best suited to the particular conditions of operation. All tires are bought outright, however, and no tire supply contracts arranged on a mileage basis have been made. The railway expects that each tire will give at least 12,000 miles service.

As October, 1924, was the first full month of bus operation, the management feels that it is too soon to draw definite conclusions regarding the financial success of the experiment. The cost of operation has not yet been accurately determined, but the railway believes that the final figure will be between 25 cents and 30 cents per bus-mile. Even if the cost should reach the maximum believed likely, that is to say about 30 cents per bus-mile, it will be less than the previous cost of railway operation per car-mile. Moreover, it will also be lower than the present revenue per bus-mile, which is, as already mentioned, approximately the same as the old revenue per car-mile.

Among the advantages resulting from the substitution of buses for cars in this instance were the release of track and line maintenance gangs formerly required for the Lexington division and a reduction in the supervisory force at the carhouse. No power need now be purchased from the Edison Electric Company, as the car line which has continued to operate in Lexington can be supplied with power over the railway's own feeders from other stations. Some of the cars which were released when bus operation was inaugurated have been placed in service elsewhere. Others, however, were considered too old and too heavy to be used any longer, and these were scrapped. Accidents have been fewer with the buses than they were previously with the cars.



One of the Extra-Length White Buses on the Road from Lexington to Concord

To protect itself in this respect the railway carries liability insurance.

In so far as possible the trainmen who formerly operated cars in this division have been retained by the company in the capacity of bus operators. Those who were thought to be temperamentally unsuited for conversion into operators of motor vehicles were transferred to other divisions to operate cars there. Two car mechanics who formerly worked in the pits at the North Lexington carhouse have been converted into auto mechanics, and one extra man has been hired. A few shopmen were laid off.

At Natick, the Middlesex & Boston Street Railway operates five buses on a crosstown line. Here the situation is similar to that at Lexington, and the same general method of operation is followed. Service on 10 miles of railway route has been suspended. Buses operate from South Wayland to Natick, a distance of 8 miles, and a branch line covers 2 miles more. Because of very light traffic at the ends, the bus routes have been shortened a little from what the car routes used to be. The motor vehicles are housed here in a converted carhouse similar to that at Lexington.

Contracts have been made with the town of Wayland for the regular transportation of school children and with the Roxbury Carpet Company for carrying its employees. In order to handle this service properly the railway has just purchased an additional bus.

METROPOLITAN ELECTRIC TRAMWAYS LIMITED
LONDON UNITED TRAMWAYS LIMITED
SOUTH METROPOLITAN ELECTRIC TRAMWAYS & LIGHTING COMPANY LIMITED
55 Broadway, Westminster,
London, S.W. 1.

Nov. 19, 1924.

I have to acknowledge receipt of your letter of the 11th inst. and am very glad that you and your deputation, while having a very strenuous time in this country, enjoyed your visit. Any little thing that I was able to do to make your visit useful and enjoyable I was very glad to have the opportunity.

I received some few weeks ago a copy of your report and should like to congratulate you and your colleagues on its excellence.

In a very short time you seem to have got at the essentials of our problems in this country, especially in London, and I consider that your conclusions. while being frank and in consequence all the more valuable, are in the main, correct.

It is true, as you state, that in this country there has not been any considerable change in design of tramcars for the last 20 or 25 years. We are, I suppose, instinctively conservative. On the other hand, it is only fair to realize that the zone system of fares, or rather the stage system of fares in this country, has prevented the development of the "pay as you enter" system which is so well known in the States.

The time taken to collect fares, issue tickets, etc., on the platforms has been a difficulty preventing the introduction of "pay as you enter" principles.

Personally I believe that these difficulties are capable of solution, and some progress is being made on these tramways with platform fare collection.

Another point that you raise in your report is the question of the low average speed in this country as compared with the average speed on American systems.

I am, of course, not in a position to defend all the undertakings in this country against the charge of slowness of operation, but I think you will agree with me that in London at any rate the average speed of tramcars both on our systems and on that of the London County Council is, at least, as high if not higher than the average speed of your American systems operating under similar conditions.

C. J. SPENCER,
General Manager.

METROPOLITAN DISTRICT RAILWAY COMPANY
LONDON ELECTRIC RAILWAY COMPANY
CITY & SOUTH LONDON RAILWAY COMPANY
CENTRAL LONDON RAILWAY COMPANY
55 Broadway, Westminster,
London, S.W. 1.

Nov. 21, 1924.

I received with unusual pleasure your letter of the 10th inst., and am very glad that you found your visit to the Old Country both interesting and edifying.

The report of your peregrinations was almost crowded with useful and informative data, much of which will be very handy for future reference. In the short space of time at your disposal I think that your report could hardly have been more complete, and your kindly personal references are appreciated. But the pleasure was not only on your side. Our several meetings with you were most enjoyable, and the interchange of experience and thought must necessarily stimulate and widen our interests in transportation from an imperial point of view.

J. P. THOMAS,
Operating Manager.

Tire Failures Can Be Reduced

THE GOODYEAR TIRE & RUBBER COMPANY
AKRON, OHIO, Nov. 19, 1924.

We wish to express our appreciation for your timely comments in the Nov. 8 issue of the ELECTRIC RAILWAY JOURNAL, under the heading "More Attention to Tiring Will Save on Re-tiring."

The rapid strides being made in the bus industry call for a close co-operation between the bus engineers as well as the actual operators of the buses. In cases where mass transportation is a factor and standees are permitted, the tires are badly overloaded and go out of service prematurely.

It has been our experience that manufacturers have equipped their units with tires of the proper size based on the seating capacity of the bus, but where overload is a factor the use of larger tires is very desirable, and is a distinct advantage for the operator.

Continuity of service is of great importance to the bus operator. When delays occur on the road due to tire failures, the loss of revenue is a serious factor, while the interruption in operating schedules seriously affects the good will of the service.

We have endeavored to assist members of the American Electric Railway Association by making analyses of their operating conditions and making impartial recommendations regarding their tire equipment. This service is always available to members of the association.

J. M. LINFORTH,
Manager Highway Transportation Department.

Association News & Discussions

Midwest Has Good Meeting in St. Louis

Association Hears Papers on Street Congestion, Noise Reduction, Bus Operation, Freight Haulage, the Future of the Interurban and Many Phases of Electric Railway Work of Current Interest

ON NOV. 24 and 25 approximately 150 members of the Midwest Electric Railway Association, embracing the states of Colorado, Nebraska, Oklahoma, Kansas, Arkansas and Missouri, assembled at St. Louis, Mo., for the midyear meeting of the association. Subjects of current interest, ranging from an analysis of city street congestion to a study of bus operation by electric railways, furnished a full technical program, which was supplemented by an inspection trip on Tuesday afternoon to points of interest on the property of the United Railways of St. Louis and a visit to the plant of the St. Louis Car Company.

The meeting was opened by President Charles W. Ford, general superintendent Kansas City, Clay County & St. Joseph Railway. He called on R. J. Lockwood, assistant manager for the receivers United Railways of St. Louis, to introduce, in turn, Hon. H. W. Kiel, Mayor of St. Louis, and Hon. Rolla Wells, receiver United Railways of St. Louis and former Mayor of the city. Mayor Kiel expressed a firm conviction in favor of providing rates which would make high grade service to the public possible. He warned railway men that they must keep abreast of the times and of changing conditions in their industry if they intended to continue handling the transportation facilities of the modern city.

Rolla Wells said that the primary thought of the receivers of the United Railways was to insure adequate and improved service to the public. He stressed the importance of making favorable public contact through employees. So far as the public's interest in the utilities is concerned, Mr. Wells went a step beyond Mayor Kiel in saying that the public is not only interested in the condition of the utilities, but is in a measure actually responsible for this condition because of the control which is exercised through public regulatory bodies. Restriction of the rate of fare below that necessary to render proper service involves a question of the right of any public official to restrict the quality of service rendered the public, which, he maintained, wants good service and is ready and willing to pay for it.

F. G. Buffe, general manager for the receivers Kansas City Railways, responded to the addresses of welcome. He said that the optimism expressed by the speakers relative to the future standing of the utilities in the public mind augured well for the prospects of the industry. The broadening viewpoint of railway men was held up as another encouraging sign and he pointed to the rapid crystallization of opinion in favor of fitting the motor bus into the general transportation scheme, wherever it is suitable, as an example of this. He also held that the public and the commissions are regaining confidence in the electric railways, and pointed to the popular sentiment in Kansas City in favor of the railway company operating buses, exclusively, in such locations as they are required.

Mr. Stoffel Shows Progress of Freight Haulage by Electrics

The technical program was opened by T. H. Stoffel of the Westinghouse Electric & Manufacturing Company, who read a paper on electric railway freight haulage. A comprehensive illustrated article on this subject by Mr. Stoffel was published in the Sept. 27, 1924, issue of the ELECTRIC RAILWAY JOURNAL. In his present paper Mr. Stoffel said that the transportation of freight by electric railways has now reached a stage where it has become an important part of their business. It can no longer be considered an experiment, either from an operating or revenue producing standpoint. The results obtained from freight operation in practically every case where a consistent plan of development has been laid out and followed have more than met expectations. The gross income from this business during 1923 was three times what it was in 1913 and amounted to more than $50,000,000. In addition, the progress made in the development of freight business during the current year is greater than for any similar period in the past. Net earnings vary from 15 to 30 per cent of the gross, after paying in full all items directly chargeable to freight operation and allocating other items, including taxes, on a prorated basis.

Some of the advantages which accrue to certain classes of shippers from the service made available by electric railways were outlined by Mr. Stoffel and specific examples of such situations were described. This included instances of jobbers and manufacturers extending their markets by being in position to make electric railway deliveries in territory formerly monopolized by competitors more favorably located geographically. He also cited instances of the development of profitable merchandise business by electric lines not able to handle heavy or long-haul tonnage. This was done by active co-operation with chambers of commerce and other civic bodies in the towns for the purpose of locating new industries on the road, and by working with farmers' associations to aid them in reaching or developing new markets for farm products.

Mr. Stoffel described one situation in which the railway had been instrumental in inducing farmers to raise tomatoes on land which had formerly yielded only poor grain crops and was rewarded by the development of a thriving new canning industry that produces a very profitable freight business for the road. In another case a profitable business from handling fruit direct from grower to market was built up as the result of the railway taking the initiative in bringing the farmers and the commission men together.

The place of the motor truck in building freight business for electric lines was analyzed. Mr. Stoffel went into this subject both from the standpoint of using the truck as a feeder for extension of service into territory beyond the rail line and also for various terminal purposes. The present status of pick up and delivery service was discussed and some of the problems connected with this subject were outlined. He said that complications arise when the railway attempts to give pick up and delivery service. Shipments are forwarded subject to delivery on presentation of bill of lading only, and usually such bill of lading is at a bank attached to the draft and is not available when the shipment is delivered. This makes it necessary in many cases to haul the shipment back and forth several times before delivery can be legally effected. A consignee, such as a large department store, which may have two or three warehouses in addition to the retail store, requires shipments to be moved twice or more before correct delivery can be made. A consignee may be only a broker having desk room in an office building, in which case shipment would have to be taken back to the freight terminal and held until disposition is given.

Mr. Stoffel concluded that all rail lines will eventually find it necessary and expedient to furnish pick up and delivery service, but expressed the belief that when that time comes the service can be most economically and efficiently rendered by employing a single responsible and dependable agency to do the work for all lines in a given terminal community.

In answer to a number of questions Mr. Stoffel explained some of the various phases of pick up and delivery service in connection with freight traffic. He said that on the basis of experiments conducted by the steam railroads at Baltimore the actual cost of such service would require a charge of approximately 15 cents per 100 lb. in excess of the regular tariff. Under the experiment being conducted there, the shipper pays the 15-cent charge at his end of the movement and the consignee pays the same charge for the delivery at the other end. He said further that where such pick up and delivery service was made optional with shippers it had not proved to be successful, as most heavy shippers were equipped with their own motor trucks and preferred to keep these busy handling their shipments to and from freight houses rather than to pay the extra charge for this service by the railroad. He said that such optional service was used most by the infrequent shipper, and that the tonnage on this class of business was very light and did not pay for the service. Another objection to optional pick up and delivery service was held to be the delay caused by the necessity of the agent to determine whether or not such service is desired on each shipment.

DISCUSSION ON STREET CONGESTION REMEDIES

City transportation and congestion were treated in a paper by C. E. Smith, consulting engineer city of St. Louis, which is printed elsewhere in this issue. In the discussion of the paper Mr. Bennett of the United Railways said that although he was heartily in accord with no parking regulations a large part of the short-haul riding produced on street cars by such regulation would come in the rush hour, thus increasing the peak on the railway. R. P. Woods, vice-president and general manager Kansas City, Clay County & St. Joseph Railway, said that marking of arterial highways was a forward step recently taken in Kansas City. He also felt that no-parking regulations should be made to meet the specific conditions existing at certain points in the business district. Raised safety platforms are impracticable on narrow streets, according to Mr. Woods, and are objected to by fire departments.

Samuel Weimer, chairman of the rapid transit committee of the St. Louis Board of Aldermen, expressed the belief that a subway for street cars in St. Louis would be beneficial and was practicable. He said that buses and street cars on the same streets increased congestion and that one or the other must be taken off.

The use of the bus in city transportation service was the subject of a paper presented by B. Hilburn, general manager Tulsa Street Railway, which will be abstracted in a later issue. Discussing the paper, A. E. Reynolds, vice-president and general manager Springfield Traction Company, said that the selection of the proper type of bus to meet the service requirements was a difficult problem. He expressed the conviction that there is a place and a future for the bus in the general scheme of city transportation.

E. R. Kinsey, president of the Board of Public Service of St. Louis, said that the bus is here to stay and that it has a useful field to serve. He maintained that every rapidly growing city needs some form of flexible transportation to give service in new communities where railway extensions are not practicable financially. It is not reasonable to expect the railway company to speculate on the development of a new community to the extent of making the heavy investment required to put in an extension of the rail service, and consequently he felt that during the period of development the bus is the logical form of transportation until the community grows to a point where the increased traffic justifies the extension of the rail line. Buses should be on the same footing as railways in regard to regulation, according to Mr. Kinsey, and the existing utility company should handle the entire transportation service of the city, including the buses. This makes for economy and efficiency, he said, because of the elimination of unnecessary duplication of service. However, bus service should be given where there is a demand for it and where the people are willing to pay the increased fare necessary to support this service. Allowing independently operated buses to skim off the cream of the profitable traffic in competition with street cars works to the ultimate ruin of the entire transportation service of any city.

In answer to a question, Mr. Hilburn said that the company is operating 16 and 25-passenger buses in Tulsa and that the saving in cost of gas on the smaller vehicle is offset by the increased maintenance. Comparatively high maintenance is caused by lack of provision in the design for overloads. The total operating cost was given at 19 cents per bus-mile, including 3 cents for depreciation and 1¼ cents for insurance. He said that insurance was purchased on a mileage basis, the rate being the figure given. In answer to another question, he said that the total amount paid by the insurance companies in settlement of claims was less than the accumulated premium paid.

Mr. Woods outlined some of the experiences of the Kansas City, Clay County & St. Joseph Railway in going into the bus business to fight competition by independent operators paralleling the interurban line. He said that modern bus equipment in competition with the railway had caused a serious drop in the gross income, and that this had forced them to fight the competition by putting buses of their own into service. Study of the effect of a new hard road which was built parallel to the interurban, he said, disclosed the fact that 19 per cent of the passenger business lost was attributed to the use of private automobiles.

INTERURBANS MUST INTRODUCE NEW SERVICES AND NEW SELLING

A paper by D. W. Snyder, vice-president Illinois Power & Light Company, on the future of the interurban was delivered on Tuesday morning. This future, Mr. Snyder pointed out, is uncertain only in the same sense as that of any other business in process of evolution. The passing out of some of the smaller and weaker roads has created a false impression of the status of the electric railways. He attributed these failures to the natural reaction from a boom building period in which some roads were built that were not justified by density of population or conditions of competition.

The situation of the interurban road following the advent of the hard roads and the bus was likened to that of the barber shop when the safety razor was introduced. By making their shops more attractive and by pushing other lines like massages, shampooing, hair singeing, etc., the barber has actually put his business on a higher plane and has become much more prosperous than when his very existence was threatened by the safety razor. It was pointed out that the barber accomplished this by first putting his business in better position to serve his customers, and then adopted modern methods of selling this improved service to the public. Similar methods, it was held, would assure a useful and profitable future for the electric railways.

Results accomplished by the North Shore Line in going from receivership to the first Coffin prize in seven years were held up as a shining example of what can be done by proper management. Although the North Shore Line is in a special situation, he maintained that the same fundamental methods would apply to the industry as a whole. He advocated building on the principle that the first essential in selling service is to have good service to sell.

Mr. Snyder felt that more publicity should be given to the comparative cost of travel by automobile and interurban, and cited experience on the Illinois Valley division of the Illinois Traction System as an example of what could be done in inducing traveling salesmen to use the interurban. He said we have heard much about modernization, but that as a whole the industry has not yet grasped the full significance of what modern equipment and methods will do in reducing operating costs and attracting new business.

INTERURBANS ESPECIALLY CAN UTILIZE THE BUS

Although the motor bus can be and has been ruinously destructive to interurban electric railways when allowed to compete unrestrictedly, this vehicle is only another transportation tool, Mr. Snyder said, which in the hands of competent transportation men can be profitably applied to improve existing facilities and attract new business. He felt that there are few interurban railways that cannot make use of the motor bus, and none that can afford to ignore it. He sounded a note of caution, however, by saying that even now the same ill-advised overexpansion that has marked the development in other lines of business is going on in the introduction of buses in some situations.

FREIGHT BUSINESS OFFERS GREAT POSSIBILITIES

Referring to the growth of freight and express business, Mr. Snyder said that the future is far from gloomy. He cited the recent completion of a $1,000,000 freight terminal in Indianapolis as an example of the proportions which this business is beginning to assume. Last year's gross freight revenue on the North Shore Line exceeded its total revenue of eight years ago from all sources. Statistics prepared by the A. E. R. A. showed an increase in electric railway freight business during 1923 of 35 per cent. The Illinois Traction System freight business is now greater than its passenger business. He said that 32 electric locomotives are now in service on his road for handling this business and that the first of six new 80-ton locomotives of the articulated type has been put into service. Long-haul freight business is being developed, M. C. B. standard equipment is used and is interchanged with steam roads. Through rates, switching agreements and physical connections have been established with practically all steam railroads.

In the discussion, he advocated development of local trucking business by short interurban lines serving a number of towns. He pointed out that inefficient methods and improper maintenance make present independent truckers very wasteful, whereas an organized trucking service would attract business and make substantial savings in operating costs. He said the time has come for the small interurban lines to go into the trucking business, and unless they do so other interests will organize the terminal trucking within the towns they serve, and will then expand this service to duplicate that given by the railway between the towns.

A paper by R. W. Bailey, superintendent of the power and equipment Kansas City Railways, on the subject of noise reduction will be published in an early issue. In the discussion it was brought out that the practice of casting graphite plugs into comparatively hard brake shoe material is being tried out and seems to reduce materially the squealing of such shoes.

BUS SUBSIDIARIES OF RAILWAYS ELIGIBLE TO MEMBERSHIP

In the business session that followed the prepared papers Mr. Lockwood brought in a report prepared by a special committee on revision of the by-laws, which changes the rules of the association so as to admit bus subsidiaries of railway companies as active members and allows the representatives of bus manufacturers to join the association as associate members. This report was adopted. The resignation of Charles W. Ford as president of the association to take effect Dec. 1, at which time he will sever his connection as general superintendent of the Kansas City, Clay County & St. Joseph Railway to become a member of the sales organization of the Yellow Coach Manufacturing Company, was accepted by the executive committee. A special committee was appointed to draw up a resolution of appreciation of Mr. Ford's services to the association, and he was also elected to honorary membership. The executive committee elected Ernest Stenger, receiver Denver Tramway, president, to fill the unexpired term of Mr. Ford, and elevated R. B. Campbell, secretary and general manager the Arkansas Valley Interurban Railway, to the office of vice-president. Bruce Cameron, vice-president and general manager Joplin & Pittsburg Railway, was elected to fill the place made vacant on the executive committee.

At the banquet on Monday evening J. C. Hall, legal representative Missouri Public Utility Association, advocated increased interest on the part of utility men in legislative activity. He said that such interest should be directed toward supplying members of the legislatures with authentic information regarding the utility business. There has been a woeful lack of such activity in the past, with the result that indiscriminate competition and many other conditions detrimental to the service and growth of the utilities have been permitted to exist.

E. F. Wickwire, vice-president Ohio Brass Company, told of the work that is being carried on through the American Association for "friendlyizing" the public and also told of the publicity given the pleasant good-natured "Traction Tom" conception of the electric railway industry to take the place of the despotic "Traction Baron" attitude which had been allowed to develop in the minds of the public and the press. Mr. Wickwire closed a humorous and entertaining presentation of this subject with the serious admonition that anything can be accomplished in the work of improving public opinion providing personal ambition is subordinated to the general objective of promoting the welfare of the industry. This thought was summarized in the words, "Anything can be accomplished if no one cares who gets the credit."

City Transportation and Street Congestion*

Importance and Permanence of the Street Railway in Any Scheme of Local Transportation and Various Methods of Relieving Street Congestion, Speeding Up Cars and Attracting Patronage

By C. E. Smith
Consulting Engineer City of St. Louis

TRAFFIC congestion came on suddenly with the automobile and will continue in varying degree depending on the success of relief measures. Business men are not yet thoroughly awake to a realization of the importance of the traffic congestion evil.

It is axiomatic that the transit lines should offer the smallest possible interference with other traffic, should be least interfered with, and should promote comfort and convenience to the greatest number. Nevertheless, the street car has been the worst sufferer from the increasing use of the automobile, because: (1) The normal increase in street railway business has been interrupted; (2) accidents and consequent costs of operation have increased; (3) service has slowed down, and as the automobile has educated the people to higher speeds they have been less tolerant of the speed of street cars; (4) there is a popular idea that the street car should be taken out of the way of other traffic and that it should be superseded by other means of transit. That the latter is not true is proved by the fact that each year the street railways of the country establish new records for passengers carried, showing that in spite of the auto bus and automobile which will supplement and not supersede the street cars, they are here to stay and must be provided for.

Even in New York City, which has the greatest measure of rapid transit and bus service, the street car business continues to increase. In 1923 more than 1,000,000,000 passengers were carried on street cars there, rapid transit lines carried 1,500,000,000, and the buses about 100,000,000. Even in London, where buses are used to the greatest practicable extent, the street cars carry more than half the surface travel.

There is ample evidence that street cars carry more than other agencies of transportation and take less space on the streets. Thus, in the Chicago Loop district 50 per cent of the traffic consists of automobiles that carry 19 per cent of the traveling people, while street cars that constitute about 2 per cent of the street traffic carry 74 per cent. In Baltimore a traffic census showed that street cars, less than 15 per cent of the traffic, carried 89 per cent of the people, while other vehicles constituting 85 per cent of the traffic carried only 11 per cent. In Los Angeles during a rush hour street cars constituting 4 per cent of the traffic carry 66 per cent of the people, while other vehicles constituting 96 per cent of the traffic carry 34 per cent. Similar figures might be continued indefinitely. A conservative estimate would place the street car riders at not less than 75 per cent of the traveling public. It would seem that their interests should have at least 75 per cent of the consideration.

City transportation for the great masses of people must continue to be provided by street cars. The peculiar nature of this business, requiring a large investment in proportion to the revenues, and preventing expenses from being increased or decreased in proportion to changes in volume of business, makes it peculiarly susceptible to changes in business conditions.

Nothing is clearer today to those familiar with the problem than that competition in street transportation is wasteful and must be eliminated so that facilities may be best co-ordinated with the traffic. Particularly must street car service be protected from unfair competition of favored, subsidized or unregulated agencies of transportation. Otherwise the mainstay of the public's transportation system will break down and the great mass of the people will struggle along with inadequate transportation facilities.

Until the advent of the automobile the street car was the fastest means of transportation for general use in cities without rapid transit facilities, and it is still and will continue to be the preferred vehicle for mass transportation, properly co-ordinated with bus service as may be expedient. But people are less tolerant of slow motion than ever before, and the average of 10 m.p.h. made by city street cars no longer seems attractive. Speed is the slogan of the day and it seems that people are intolerant of even a moment's delay. The automobile is responsible for this speed mania.

---

*Paper presented before meeting of Midwest Electric Railway Association at St. Louis, Nov. 24-25, 1924.

It is most irritating to car riders to drag along while the motorman kills time in slack hours because his schedule time is too long or for other reasons. Slack time and needless stops and waits should be rigidly eliminated from the schedules of both city and interurban properties. The drift of street car passengers to automobiles will decrease and may actually turn back if the service can be speeded up and generally made more attractive.

There are many places where, by reason of former competitive and duplicate railway service, street car lines are unnecessarily long and may be shortened and reduced in number by a carefully studied plan of rerouting. Such a study in St. Louis indicated that 25 or 30 miles of track might be done away with and service improved by rerouting. This is being carried out a little at a time. When handled properly the cost is small. Another way in which service may be improved, where conditions are favorable, is to run street cars express through areas of light business between areas of heavy loading and unloading, the intermediate business being handled by buses. This is being done successfully at Providence, R. I. (see ELECTRIC RAILWAY JOURNAL for March 15, 1924, page 411).

Both relief of congestion and improved transportation service in cities will be secured by the following measures:

1. Unification of all systems of transportation within a city, including street cars, buses and other agencies of mass transportation.
2. Single fare and free transfers within a single-fare zone, with appropriate charges beyond.
3. Expansion of facilities in amount and character best suited to the service.
4. Route through traffic so as to avoid the congested business areas.
5. Speed up service whenever possible; shorten schedule time in off-peak hours.
6. Establish loading platforms on busy streets for protection and convenience of car riders.
7. Provide storage yards for cars in or just outside business districts to store peak-hour cars during day and thus avoid interference with other traffic and dead mileage when taking them out empty in the morning and back empty before the evening rush.
8. Reduce looping of cars and turnbacks in congested districts and operate through runs to the greatest possible extent.
9. Avoid crossing of busy lines in congested districts.

City planners are quite free in recommending as one of the ways of reducing or rather avoiding increased congestion in business centers that building heights be restricted. The right to do this has been amply sustained in the courts. Boston is a notable example in this country. There building heights have been restricted for about 25 years. But that precaution would seem to safeguard the interests of succeeding generations rather than to offer any measure of relief now.

Building heights may not be so easily controlled. Regulations to that end are welcomed in the abstract but not in the concrete. In a large mid-Western city the City Plan Commission recommended an ordinance to restrict building heights to 120 ft. The Board of Aldermen after public hearings and over the protest of the City Plan Commission established 150 ft. as the maximum height. Shortly thereafter the chairman of the City Plan Commission, as the architect for an owner, defended and helped to secure the passage of an ordinance for a new building 280 ft. high, although he had previously appeared in protest against the ordinance allowing 150 ft. in the same location.

Whether traffic congestion is increased more by high buildings than by the increased travel made necessary when business is transacted in smaller buildings spread over a larger area is still worthy of further discussion. Certainly the cost of transacting business over a larger area is more expensive and raises the question of whether concentrated business or traffic congestion shall control. The tremendous investments for aggregations of large buildings would appear to justify the concentration of business; the property values and concentration of travel resulting therefrom create conditions that permit expenditures for rapid transit and other expensive means of transportation that would be impossible if they had to be spread over a great area.

Boston has had a stringent law restricting building heights for many years, the result of which has been to spread the business district over a large area. Apparently this has brought into the district many automobiles that might not be used if business were transacted in a smaller area. Notwithstanding the low buildings and the enlarged business area, Boston traffic congestion is so bad that recently a new street through the business district was recommended for relief at a cost of about $30,000,000. There is nothing in the Boston situation that would indicate that the restriction of building heights has ameliorated traffic congestion.

On the other hand, in New York City, where there has been no control of building heights, the surface traffic congestion in the districts containing the tallest buildings is no worse than in Boston. True, there is terrific crowding and congestion of the underground transit facilities, but that is because the facilities have not been provided to keep pace with the volume of traffic, by reason of a deplorable controversy between state and city authority. Engineers long ago determined on additional facilities, and New York can well afford to provide them. The annual charge on each $100,000,000 of public money spent there amounts to only about $1 per capita of population per year, so the end of New York's spending capacity for the improvement of local transportation is quite far off.

Decentralization has been suggested by many as one permanent solution of the traffic problem; that is, the development of a number of outlying business districts. This is apparently taking place to a greater extent than ever before in most large cities, but there is no indication that it will materially decrease the importance and expansion of the main business center, where most of the congestion troubles are experienced. Rather it appears that each additional outlying district creates new centers of congestion and raises problems which may cost more in the aggregate to solve than if more intensive remedies be applied to a centralized area. There is no doubt in my mind that decentralization will result in increasing the amount of automobile traffic between the various centers while at the same time street car travel may also be increased correspondingly. In spite of traffic congestion and in spite of the growth of outlying business centers, surveys of downtown business show conclusively that business there continues to increase. In the case of the large department stores, this is much greater even than would normally be expected.

Traffic conditions in the congested central business district can be relieved by moving out of it certain lines of business or trades that can be transacted as well or better elsewhere. Thus the writer recently recommended, after a careful survey, that the fruit and produce merchants be moved from the most congested part of the retail district at New Orleans to a much more suitable location 2 miles away. Similar results are about to be realized in Chicago by the movement of that business out of the congested Water Street district. This method may be applied to other lines of business, always, however, with the possibility that there may be a drop in property values in the old district that may or may not be recovered.

EVERY CITY SHOULD HAVE A CITY PLAN

Every city large enough to have a street railway system should have a city plan, the foundation of which, from a traffic standpoint, should be a major street plan. As the great majority of the people depend upon street cars for their transportation, the interests of these car riders should be represented by the street car company's officials taking a keen and continuing interest in the planning as it affects street car service and traffic control. The ELECTRIC RAILWAY JOURNAL of March 8, 1924, after the American Electric Railway Association meeting in St. Louis on March 4, said: "To emphasize the importance of railway men taking part in the broad planning for relief of street congestion, it may be said that while they are only indirectly interested in some of the planning, they will directly profit or suffer by the success or failure of the broad relief plan considered as a whole."

In city planning more attention should be given to the improvement of marginal streets around the edge of the congested districts so that traffic may be detoured. At present, streets leading directly into the congested districts are being widened and improved at a cost of millions of dollars, while smaller expenditures on marginal streets would in many cases give better results. Such streets will be of particular importance in providing free routes to and from garages on the edges of such districts, thus keeping many automobiles out of the area of congestion.

In addition to providing for proper street circulation, the city plan should give attention to transit, railroad facilities, grade crossings, zoning, etc. In planning for the future it is well to keep in mind that all the needed improvements will not be made at once. Wherever cutoffs and street widening projects have been carried out, the benefits have usually exceeded the cost. While the cost for some of these improvements seems high, it does not amount to much per capita when spread over the entire community. In fact, city government is one of the cheapest benefits we possess, as it costs only from 10 to 20 cents per capita per day, and very considerable public expenditures can be undertaken without being felt very seriously.

Many palliatives have been suggested for the relief of traffic congestion. The Midyear Meeting of the American Electric Railway Association held at St. Louis on March 4, 1924, was devoted to this subject. Abstracts of the papers presented are contained in the March 8 issue of the ELECTRIC RAILWAY JOURNAL. It was brought out in that meeting that means should be found to secure the best use of present facilities before making large expenditures for new construction. Mr. Bartholomew, engineer of the City Plan Commission of St. Louis, said: "During the rush hour, when every available square foot of roadway ought to be devoted to movement, parked cars absorb 20 per cent of the roadway. The vehicular flow, thus restricted and confined to narrower channels, slows down to such an extent that from 50 to 100 more street cars accumulate in the district than should be there according to schedule. Two thousand vacant standing automobiles cause the street cars, carrying 75,000 or more persons home from work, to lose from 5 to 15 minutes of scheduled time."

One of the very best things that could be done to remedy this would be to stagger the hours of offices, stores and factories, but unfortunately it is difficult to do enough of this appreciably to relieve the congestion. City traffic control can help in the following ways:

1. Left turns should be prohibited as far as reasonably practicable.
2. Width of commercial vehicles should be limited to not more than 8 ft.
3. Automatic traffic signals should not be installed at intersections in congested districts, but such control should be effected by means of traffic officers. (It was thought that synchronized traffic control by automatic signals would serve well in such places, but where tried—as at Los Angeles—the results were disappointing because of the varying traffic at the different intersections.)
4. Traffic officers should be instructed to give right of way immediately to street cars when the gong rings ready to go.
5. Pedestrians should be compelled to move with the traffic and to wait for signal.
6. One-way streets should be established. (Excellent results have been secured from this in New York, Philadelphia, Boston, St. Louis, Pittsburgh, New Orleans and many other cities.)
7. Use of streets in congested districts should be prohibited to trucks and drays during rush hours.
8. Parades in congested districts should be absolutely prohibited.
9. Truck service to buildings during night hours should be encouraged, also during slack hours of the day.
10. Individual heating and power plants within the congested district should be shut down and service secured from central public utility plants removed from the congested area.
11. Building occupants who continually occupy street space for loading or unloading trucks should be compelled to use alleys or provide set-back spaces for trucks within their own buildings.
12. Where parking is permitted in the business district it is desirable to keep the automobiles off streets occupied by street cars. (A survey of all cars parked in the streets day after day may be used to ascertain the owner, his business, the necessity for his car downtown. If the car is not necessary in his business effort should be made to determine why it should not be kept at home. Good results were thus secured at Boston.)
13. Autos should be compelled to be parked within 6 in. of curb and provide not less than 5 ft. of space between parked cars to avoid delays to other traffic when getting in and out of parking place.

The movement of traffic within the congested districts is most seriously hampered today by the parked automobile and by moving automobiles that might be kept out of the district by proper planning and regulations. It is the practically unanimous opinion of all who study the problem that parking must be totally prohibited in such districts. Parking at the curb is an inheritance from the horse and wagon days and the hitching post. In those days the street widths were generally in excess of the traffic requirements, and no harm was done by such hitching. But the same streets are totally inadequate for present-day traffic that could not have been foreseen when they were laid out, and automobile parking in them causes great harm. The provision of parking space for automobiles is not a public duty and there is no equity in thus withdrawing valuable street space that is needed to expedite moving traffic.

Parking in the congested district will soon be a thing of the past. There is no justification for it. The automobile owners would never think of paying taxes, upkeep and a fair return on the value of the property occupied by standing cars. Why should they have its use free, especially when this space is imperatively demanded for more important use? There would seem to be no more equity in allowing this parking than to allow merchants to set up booths for the sale of goods in an equal area of the streets. By forcing owners to store their cars at points that may be somewhat removed from their offices, fewer automobiles will be driven downtown. This will still further help other necessary traffic movement.

Where no-parking rules are enforced, it should be done after and to the extent to which garage facilities are provided, and over a considerable area. Such a rule cannot be enforced on a single street within a district without upsetting the balance of trade. Automobiles will continue to be parked around the corners and on the next streets. The cleared street will be used as a thoroughfare on which there may be less local business transacted than when parking was permitted. Where the no-parking rule has been applied to a single street it has been modified later at the request of the merchants to permit parking for short periods up to one hour. This gives little permanent improvement in conditions. The curb is soon full all the time, and in fact, the movements to and from the curb interfere with and delay traffic more than all-day parking, and create dangers of collisions and accidents. A considerable part of the automobile traffic in congested districts is due to cruising around looking for parking places.

A better treatment is gradually to enlarge the no-parking area as fast as garage facilities are available. In the larger cities it will not be possible to support the most expensive property by garage rentals, and the storage will be somewhat removed from the centers of the district. In St. Louis a number of private garages have been constructed around the business district, but they are generally about five city blocks from the center. This distance and the rentals will discourage idle driving of autos downtown and confine it to those whose business demands will afford that cost. In the medium-sized cities it will be possible to locate garages and storage places at various strategic points in and around the business district to the great convenience of the drivers. Kansas City is a good example of this; there are numerous parking places which are so scattered as to be convenient to every part of the district.

In smaller sized cities, where there are many one and two-story buildings in the business centers, there is no good reason why the basements or roofs of such buildings cannot be made available for auto storage by means of ramps and advance preparation. In such cities there is the same parking problem as in the larger cities, but of course over a smaller area.

Traffic outside the congested district may be expedited and simplified by separating it into classes. It is desirable where several parallel streets are available for traffic to have car tracks not more frequent than on alternate streets, the other streets to have wide smooth pavements to attract automobile traffic away from the street cars.

Where such parallel streets are not available, a study of the city plan will frequently show how sections of streets may be connected by extending them across private property and widening them when necessary to get an adequate through street system. Streets occupied by car tracks should be paved for not less than 40 ft. between curbs where there is no through traffic, and preferably 60 ft. between curbs where there is through traffic and parking is permitted. Autos should be compelled to stop before entering or crossing streets with car tracks.

Minimum speed as well as the maximum should be specified for slow moving vehicles on certain streets. Trucks should be prohibited from certain streets where they would interfere with the free movement of street cars and other traffic.

In isolated cases where intersecting traffic is very heavy and the topography is favorable, it may be desirable to separate the grades of intersecting streets, either for street cars or all traffic. This has already been proposed for several cities. Where streets are wide enough to divide into three parts, traffic will be expedited and accidents reduced by providing a street car space between curbs in the center of the street and a roadway on each side, not less than 25 ft. wide and preferably not less than 30 ft. On Delmar Avenue, St. Louis, where the car tracks occupy a separate space curbed off in the middle of the street for about a mile, a saving of 3 minutes results in the rush hours, and accidents have been much less than where the tracks are in the open street beyond each end of the curbed space, as indicated by the following figures: 3,800 ft. in the open street to east in 5 months had 80 accidents; 5,400 ft. in the curbed space in 5 months had 15 accidents; 5,000 ft. in the open street to west in 5 months had 39 accidents.

Most of the accidents in the curbed space were at street crossings. As far as possible it is a good thing to compel different kinds of traffic to follow different lanes, and in some instances this might be carried so far as physically to separate them by curbs or other devices.

The enforcement of traffic regulations requires a large police or traffic squad with persistence and determination. This enforcement of traffic regulations should be under a separate department with adequate laws, funds for checking and enforcement, court backing and determination. An important feature of traffic control should be the examination of automobile drivers for age, knowledge of traffic rules, hearing and good sense before a license is issued.

It is simpler to enforce a no-parking rule than a limited-time rule. The latter requires more policing and careful records of arriving and departing cars. In either case the law should provide for impounding the cars of violators, and they should be hauled to the pound just as soon as they violate the laws. Kansas City and New Orleans, in particular, have had good results from such positive enforcement of the law. Such rigid enforcement is more effective than toleration, reminders and light penalties.

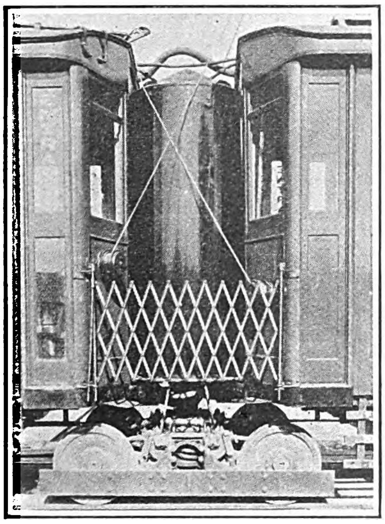
The Articulated Car*

A Résumé of Existing Designs of This Type of Car for Surface Line, Rapid Transit and Railroad Service

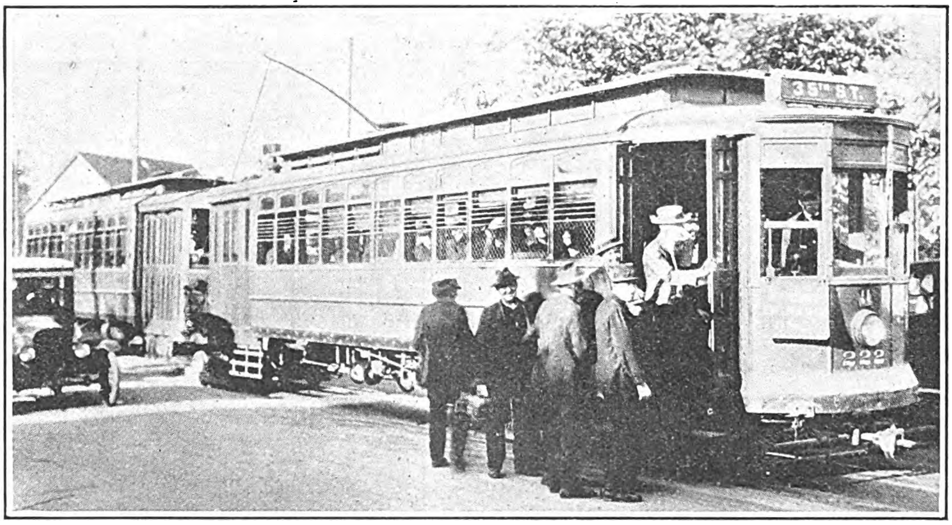
By W. G. Gove

Superintendent of Equipment Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

THE introduction of the principle of articulating steam railway cars is said to have originated in England, the first trains being placed in service on the Great Northern Railway. There are now more than 200 sets in service. These English articulated cars range in length from two-body suburban cars to a five-body car which includes a dining section permanently incorporated in the middle of the unit. A two-body articulated sleeping car has also been introduced. In September 1924, a three-body articulated car was placed in service on the London & North Eastern Railway, consisting of a kitchen body articulated with a dining saloon body at either end. A two-body articulated car has also been introduced in the Royal Mail Service, Great Indian Peninsula Railway of India.



Detailed View of Drum Connection on Milwaukee Articulated Car



Recent Type of Milwaukee Articulated Car, Using Drum Connection

All these cars were built from designs furnished by the Leeds (England) Forge Company under the British patent No. 4512 of 1907, issued to H. N. Gresley, chief engineer Great Northern Railway. On April 11, 1922, United States Patent No. 1,412,053 was issued to Mr. Gresley, who described a form of articulated car support combined with draft springs. We understand that this patent is controlled in this country by the Commonwealth Steel Casting Company of St. Louis. The objective on the English roads was primarily reduction in weight and in first cost. This depends upon the number of bodies composing the car. The principal items omitted from a two-body car are one truck, two drawbars and couplers, two draft gears, two sets of buffers, two end sill constructions, various parts of brake rigging and sundry incidental items of equipment. The saving accomplished by articulating five bodies on six trucks, as in England, is said to have amounted to 20 per cent in weight and 8 per cent in first cost.

Nomenclature Proposed

In preparing this paper I have been confronted with the difficulty of employing appropriate and brief terms specially characteristic of the articulated car. For the purpose of brevity and accuracy I will use the following terms:

Articulated Car — A multiple-bodied vehicle having the adjacent ends of the bodies supported by a single truck. In this connection an articulated car having two bodies is a *duplex car*, one having three bodies is a *triplex car*, one having four bodies is a *quad car*.

The Pilot Truck is at the outer end of the car. *The Pivot Truck* is at the point of articulation. The inclosed passageway at point of articulation when cylindrical is a *Drum;* when with an expanding canvas diaphragm, it is a *Bellows.*

---

*Abstract of a paper presented before the New York Railroad Club, Nov. 21, 1924.

At the present time the design and operation of articulated cars in the United States is in the early state of development. Considerable progress has already been made, but the practicability of some features remain to be demonstrated under prolonged operating conditions.

Details of Connections and Passageways for Articulation in the Principal Designs

The most prominent examples of articulated cars in this country are on the following railways: The Milwaukee Electric Railway & Light Company; Department of Street Railways, city of Detroit; Brooklyn-Manhattan Transit Corporation, surface division; United Railways & Electric Company, Baltimore; Brooklyn-Manhattan Transit Corporation, subway division.

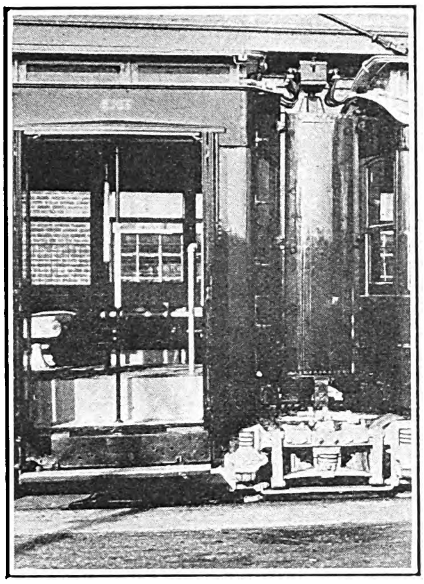
The Milwaukee Electric Railway is now engaged in a rebuilding program which will ultimately couple 384 bodies into 192 cars. Of these there are now in service 103 articulated cars of two bodies each, connected at the point of articulation by a weathertight passageway mounted on the pivot truck. On the first articulated cars in Milwaukee the passageways were of the bellows type, while the latest cars are fitted with steel drums. The pivot truck is an idler and each of the two pilot trucks has two motors. The cars are arranged for double-end operation. Each platform controller is connected with a full set of resistance on its own body of the car, thus reducing the number of wires carried from body to body across the pivot truck. [This car was described in the issue of ELECTRIC RAILWAY JOURNAL for Jan. 15, 1921, page 131.—EDS.]

The Department of Street Railways, city of Detroit has in operation an articulated car giving excellent service on the most congested route in the city. The car is composed of three center-entrance, center-exit steel bodies mounted on four trucks and arranged for single-end operation. The pilot trucks are fitted with motors, the pivot trucks are idlers. The distribution of the weight is such that 56 per cent of the total weight without passengers is on the driving wheels. [This car was described in the issue of ELECTRIC RAILWAY JOURNAL for arch 8, 1924, page 357.—EDS.]

In February, 1924, the Brooklyn-Manhattan Transit Corporation placed in service a two-body, three-truck articulated car. This vehicle, known on the road as the "duplex car," was constructed from the bodies of two cars which had been in service for some years. The bodies are connected by a drum of ample size to permit of a clear passage while the car is operating on the shortest radius curve. The over-all length of the car is 63 ft. 10 in., with seats for 71 passengers. The standing room will accommodate about 100 more passengers under rush-hour conditions. [This car was described in the ELECTRIC RAILWAY JOURNAL for Feb. 16, 1924, page 252.—EDS.]

THE BALTIMORE CAR

The United Railways & Electric Company of Baltimore has recently placed in service a two-body articulated car formed from two standard semi-convertibles. It is fitted for double-end operation with four motors. The over-all length is 74 ft. 8 in. The total weight of the car without passenger load is 67,800 lb. The total seating capacity is 87 and there is standing space motor leads are carried from body to for 78 passengers. The passageway between cars is of the drum type. The



The Center-Exit Door Is Retained in the Baltimore Car Immediately to the Rear of the Center Drum

body by way of a junction box supported on the top of the drum. Nine more articulated cars are to be built at once by this road.

BROOKLYN CAR FOR RAPID TRANSIT SERVICE

Constantly increasing density of traffic has led the New York Rapid Transit Company to place an order with the Pressed Steel Car Company for four cars, each consisting of three articulated body sections, for service in the subway. The bodies and trucks closely conform in design to those in use on this system. The three bodies will be mounted on four trucks, with an over-all length of 137 ft. The unit has seats for 160 passengers and a total capacity of 550. The total weight light is 175,000 lb., or about 1,100 lb. per seated passenger. This compares with the weight of 1,230 lb. per seated passenger of the single body type of cars in this same service.

A drum type passageway connects the bodies, affording opportunity for free circulation of passengers. These cars are equipped for operation in trains and are fitted with wide doors at their ends. The overhang is reduced to permit free passage between cars throughout the train even on the shortest radius curves of the system.

Each car is fitted on each side with six doors, each opening 4 ft. in the clear. The conductor operates all doors from his position at the rear of the car. When two such cars are coupled together one trainman operates the doors of both cars from his position at their adjacent ends.

The two trucks at the outer ends are fitted with motors, and the two intermediate pivot trucks are idlers. The equipment is also distributed to balance the weight on the trucks to the greatest advantage, the two air compressors being located on the intermediate section and a multiple-unit control equipment located near each motor truck. The hand brake and foundation brake rigging is all placed on the end sections.

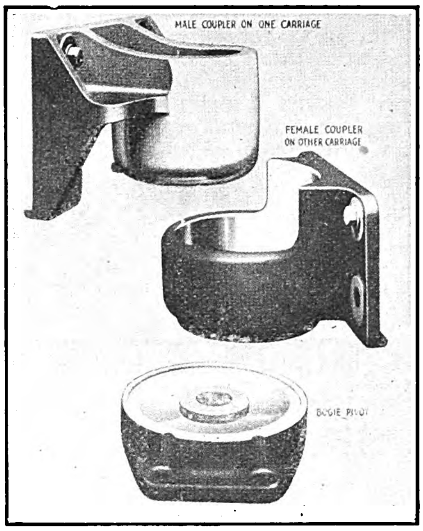
The bodies and trucks are being built by the Pressed Steel Car Company. The air brake equipment will be furnished by the Westinghouse Traction Brake Company and will include the latest form of empty and load brake which automatically adjusts the brake shoe pressure and the current input to the motors to correspond with the total weight of the passengers in the car.

Two of the four cars will be equipped with motors, control and air compressors made by the General Electric Company; the other two cars will have corresponding equipment furnished by the Westinghouse Electric & Manufacturing Company. Other items of equipment will also be furnished by competing manufacturers to determine by actual equivalent service the comparative operating reliability of their respective products.

ADVANTAGES EXPECTED

It is confidently expected that when fully developed the system of car articulation will result in a number of desirable improvements in the operating characteristics of passenger cars either in subway, surface or interurban or steam suburban service. The hoped for improvements may be briefly outlined as follows:

Comfort of Passengers.—It is claimed for articulated cars in service both in Europe and this country that there is a notable improvement in their riding qualities, the lateral motion or side rolling of the body having practically disappeared. This is accounted for by the fact that the articulated car body is supported at its extreme end where it rests on the bolster of the pivot truck and consequently has no overhang. As the articulated ends of the bodies are in close contact, there can be no slack between bodies, and consequently the cars start and stop smoothly. The passageway between the articulated bodies provides at all times for free and safe movement of passengers throughout the car. This passageway is also weatherproof and draftproof.

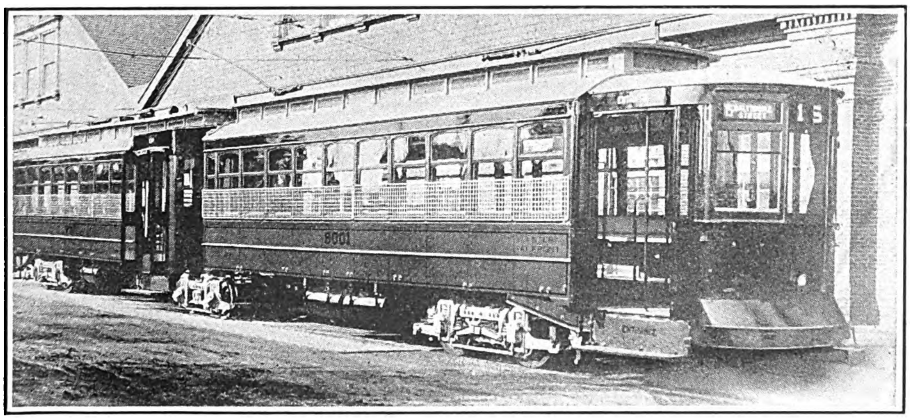


MALE COUPLER ON ONE CARRIAGE
FEMALE COUPLER ON OTHER CARRIAGE
BOGIE PIVOT

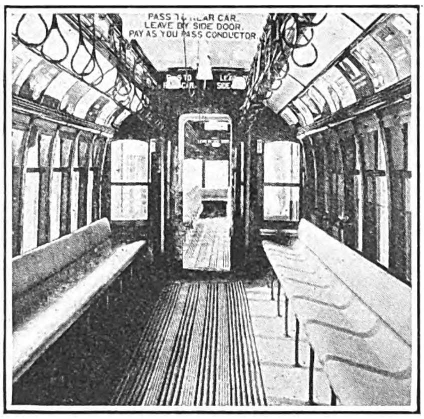
Details of Articulation Connections, London & North-Eastern Car

Noise.—One of the most disagreeable features of rapid transit subway service is noise, which is a composite of many sounds emanating from the wheels and other moving parts of the trucks, motors, gears and gear cases, as well as drawbars, safety gates and other connections between cars. These sounds are echoed and merged into an almost intolerable racket or roar by the walls of the subway or tunnel. The use of articulated cars will reduce the number of trucks, eliminate drawbars and safety gates and in consequence the noise of operation of such cars should be considerably less than a coupled train of single cars.

Reduction in First Cost.—The articulated units should cost less per passenger than the equivalent capacity of single cars. When forming articulated cars by rebuilding bodies of existing equipment, the salvaged material, consisting of trucks, motors, controllers and other parts of equipment, amounts to a considerable item either when returned to stock or applied to the equipment of new cars.



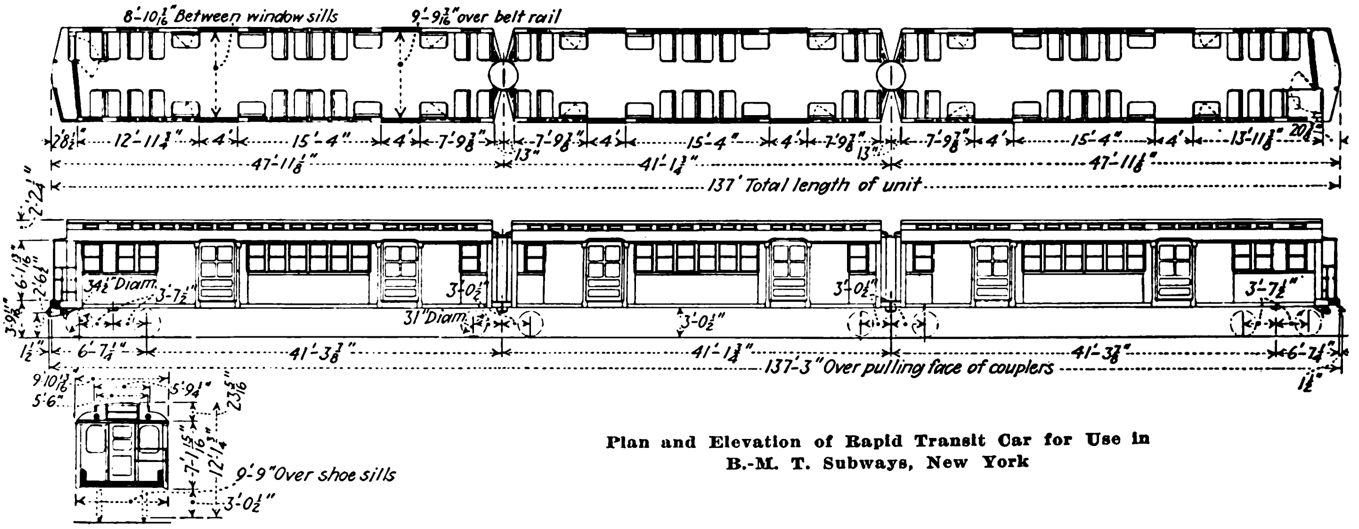
Type of Articulated Car Developed in Baltimore for Surface Operation



Interior of Baltimore Car, Showing Continuous Passageway Through the Drum

Reduction in Weight.—The greatest saving in weight will of course be realized when cars and trucks are specially designed for articulation and when every feature is given careful consideration from the point of view of economy in weight combined with reliability of service.

Reduction in Operating Cost.—There will be a direct saving in cost of energy required to operate the lighter cars with fewer trucks, a direct saving of labor in the inspection and maintenance of the consolidated units and also a reduction in the platform expense. These savings will vary according to the extent of the consolidation.



Plan and Elevation of Rapid Transit Car for Use in B.-M. T. Subways, New York

FEATURES OF DESIGN

The items of cars and truck construction involved in the system of articulation can only be briefly referred to in this paper. The function of the members is the same in most of the cars, though the details of design may vary in accordance with specific requirements of clearance, door arrangement, etc.

Bolsters. — In the first articulated cars in England the outer trucks were of the usual type, but the single truck was fitted with two bolsters, the theory being that the two bodies in passing over uneven track and around curves would have a tendency to rock independently of each other and would therefore have to be supported on separate bolsters fitted with separate side bearings. Actual experience disclosed that, under the conditions prevailing, the rolling movement was actually so slight that a truck with a single bolster could be used.

Center Plate Design. — The design used on the English cars is such that the center plate load of one body is carried on the upper surface of the center plate of the adjoining body, the lower surface of which engages the center plate of the truck. The early designs in this country followed this arrangement. More recent designs arrange for twin car body center plates, each with a separate bearing on a common truck center plate casting. This latter arrangement provides a better opportunity for lubrication and for disengaging the articulated bodies from the pivot truck when in the shop.

Side Bearings. — The design of side bearings for the pivot truck will require careful attention to provide for the proper support of the pivoted ends of the bodies and at the same time permit of the necessary freedom of each body to conform to the canting caused by the elevation of the outer rail on curves, change of grade and all the various combinations of these factors. The method of support must be such that there will be no tendency to produce torsion in the bolster of the pivot truck.

Vestibule Design. — The articulated cars in England operate on comparatively long radius curves and consequently the flexible vestibule connections consist of accordion-like diaphragms with the edges in some cases permanently attached to the respective bodies, while in other cases the diaphragms are fitted with face plates.

In the United States the development of the articulated unit was first applied to surface cars operating on short radius curves. This has led to various forms of passageways having semicylindrical side walls mounted on top of the pivot truck and maintaining free communication between the bodies even when on curves of the shortest radius. These cylinders are of steel, usually with the walls lined with a temperature insulating material. The space between the cylinders and the car bodies is fitted with rollers or other devices to provide weathertight joints. The top head of the cylinder is formed to shed water and the inside of the bottom head forms the floor of the passageway.

Mass Transport Is Cure for Parking Evil

THE National Highway Traffic Association met on Dec. 2 in New York City to consider better uses for the streets. Prof. Arthur H. Blanchard of the University of Michigan was re-elected president of the association. Traffic congestion has reached such a point, it was said, that highway authorities are now worried about minimum speed rather than maximum. The problem now is to find ways to make the speed of the stream of vehicles higher so as to facilitate movement and get greater use of the highways.

Several speakers suggested that mass transportation was the principal remedy for the parking problem. This was urged by C. M. McCreery, vice-president Six-Wheel Company, Philadelphia. He believed there would be practically a revolution in mass transportation if the parking evil was eliminated. Faster schedules could be made, more and better transportation supplied. The thing to do, he said, was to keep the private automobiles out of congested areas. To make this possible street cars and buses must provide fast, comfortable, flexible and safe service.

Prof. Roger L. Morrison, in his

paper, while favoring greater use of street cars, buses, taxis, or other forms of public transportation as one method of solving the parking problem, called attention to the effect of stops at the curb. On streets where parking is not allowed, he would not permit any stops of either public service or private vehicles. If necessary, buses could be rerouted, he said, to keep them off the restricted streets.

A vehicle has no right to stop anyway, it was held by several speakers. Fundamentally the highways are for passage, and vehicles may be stopped to let off or take on passengers, or to park for various times, only at the sufferance of the public, through the legal authorities.

Ernest P. Goodrich favored a 30-second parking ordinance. He said this would prevent parking but would permit momentary stops to take on or let off passengers.

In an address on methods of forecasting future traffic and the saturation point in the utilization of motor vehicles, Mr. Goodrich told of studies made by the Russell Sage Foundation in its monumental investigation of the future of New York City and its environs. Figures collected from all over the country indicate that the number of automobiles is rapidly approaching a saturation point. In the future, residential sections of cities should be laid out with main thoroughfares about 6,000 ft. apart. On these, street cars and buses would be operated alternately. That is, the trolley and bus should work on alternate thoroughfares. The Russell Sage studies have also shown that there is an economic limit to the amount of traffic carried on any one street for the benefit of the community. Vehicular and pedestrian movement may become so dense that it would be better economy to build other streets, instead of trying to provide more space on the ones crowded. With increase in the number of lanes of traffic, even where these lanes are separated by a parkway or a line, the efficiency falls off. From the center toward the outside each successive lane carries less traffic at a given time, so the effective width of a thoroughfare is definitely limited.

Professor Blanchard, in discussing state fees for motor common carriers, said that these should consist of two parts: first, a charge based on the wear of the highways due to such carriers; second, a charge based on the direct cost of regulation.

New England Motor Transport Conference

A CONFERENCE of those engaged in or dependent on the transportation business of New England has been called under the auspices of the National Automobile Chamber of Commerce. It will be held on Dec. 8 and 9 at the Copley Plaza Hotel, Boston, Mass. Morning and afternoon sessions will be held each day beginning at 10:30 a.m. and 2 p.m.

The problem of highway transportation in New England, both freight and passenger, will be discussed, as will co-ordination of highway transportation with other forms.

Banker Urges Caution in Customer Ownership Financing

SPEAKING before the New Jersey Public Utilities Association at its convention in Atlantic City this week, Ralph S. Child of Bonbright & Company, New York, indicated the enormous magnitude of the funds now required annually to finance extensions and improvements in the public utility field. For the first 9 months of 1924, $1,181,434,112 of new corporate issues were brought out by power, gas and railway utilities. This is 42 per cent of the total issues for all new corporate securities. The amount for the full year in 1923 was $1,138,396,000; in 1922, $980,433,000; in 1921, $671,085,000, and in 1920, $496,822,000.

He spoke also of the now general practice of issuing "open end" mortgages with additions against new construction.

Perhaps the principal point of interest to electric railway men was Mr. Child's comment about customer ownership financing, as follows:

"I would like to dwell upon the question of 'Customer Ownership.' This method of financing has been so generally taken up by public utility companies, and has almost universally been so successful that it appears to some in the investment banking business that there are certain elements of danger which may be lost sight of.

"This success has perhaps led the managements of some companies to the conclusion that selling stock is one of the easiest things in the world to do. Statistics on customer ownership sales show that the great majority of sales are made to people of small or moderate means who have had little or no previous experience in the matter of investment. They are sold, as a rule, through the personal contact of some employee of the public utility company and on the strength of a 6½ or 7 per cent return, and because of the ease with which the stock may be purchased on the partial payment plan. These buyers of stock know little about earnings statements or balance sheets—little about property values, rate of return, or margin of safety. In fact, many companies, in their customer ownership campaigns, never show an earnings statement, the meaning of it not being understood by the average stock purchaser. The customer generally becomes a stockholder or partner in the business through sales persuasion and the fact that the investment is a local one, and that the local banker speaks well of it.

"It goes without saying that the investment banker, interested in the senior securities of public utilities, has been most favorably impressed with the development of customer ownership. Naturally the placing of this equity back of the senior securities improves just that much the position of the senior securities that the banker has marketed to the public. This may be looked upon as a selfish viewpoint on the part of the investment banker. However, it may be said that with a broad view of the public utility business, the investment banker recognizes in the customer ownership movement something of value beyond that of added equity. He sees the growing list of customers who are partners in the business making for improved public relations for the utility. He sees that this experience in investment may well develop among these customers habits of thrift which can be of national benefit, and he sees an improved understanding on the part of utility employees of the problems of their company in the conduct of its business and of the importance of their company's position in the economic life of their community. These factors mean a great deal and are looked upon by the investment banker as elements that will give added strength to the position of public utilities in the coming years.

"The banker also sees certain other angles to the question of customer ownership which from his viewpoint are equally important, though perhaps not held quite so clearly in mind by the public utility companies themselves.

"It is generally recognized that there is a definite responsibility upon a public utility to give good service. However, the responsibility assumed by the company when, through its own employee organization and its own representations, it sells stock in its enterprise to its customers, is of quite another character. That utility company has invited its customers to become partners in its business and has taken on a definite responsibility which cannot be shirked or evaded, if through a succession of circumstances something should occur to impair the value of the investment and make necessary dividend cessation.

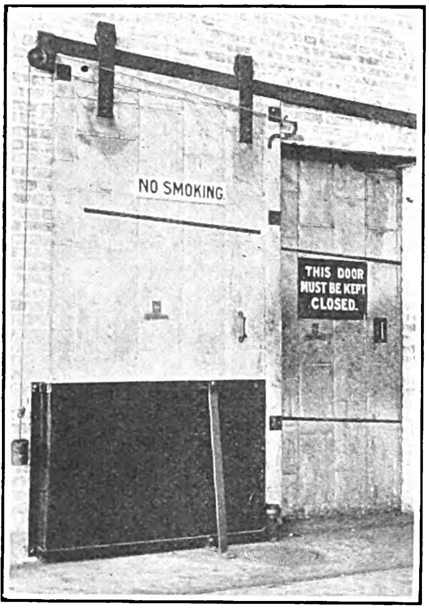
"Obviously, in the sale of senior securities there are safeguards, such as a mortgage lien on the property and a claim on earnings prior to dividends, which are not enjoyed by the investor in preferred stock. It is vitally necessary to the continuance of the strong position of the public utility industry that there be no failure in the payment of dividends on the part of any company which has sold preferred stock to its customers. Should such a failure occur it would reflect on the entire industry and might bring about complications which would be very far-reaching and possibly have disastrous results.

"It might be added that it has been noticeable in some quarters that in view of the readiness with which stock has been sold to customers by almost every public utility company which has undertaken this kind of financing, the public utility managements have naturally been much pleased with themselves. They have perhaps not taken sufficiently into consideration that the success of their initial campaign was due to a considerable extent to the fact that the people sold were new investors, who as a rule put in money out of earnings instead of out of surplus funds, and that the employee organization entered into this work with energy and enthusiasm because it was a new and unusual job, one in which the spirit of competition and personal accomplishment counted for much."

Maintenance of Equipment

Keeping Fire Doors Free and Clear

IN THE Wheaton shops of the Chicago, Aurora & Elgin Railroad sheet steel screens have been made so that the operation of fire doors cannot be impeded by material carelessly placed against them. A shield of 1/16-in. steel, reinforced at the edges and corners and braced by means of 1½-in. x ¼-in. steel, is set up around the fire door in its open position. This shield is 3 ft. high and long enough completely to protect the door. The offset at one end is fastened to the brick wall by means of expansion bolts, while the other end is fastened to the floor and braced at the top by means of a 1½-in. x ¼-in. steel bar. It is painted black and gives a very neat appearance to the shop as well as being an efficient means of preventing materials and equipment being piled against the fire door.

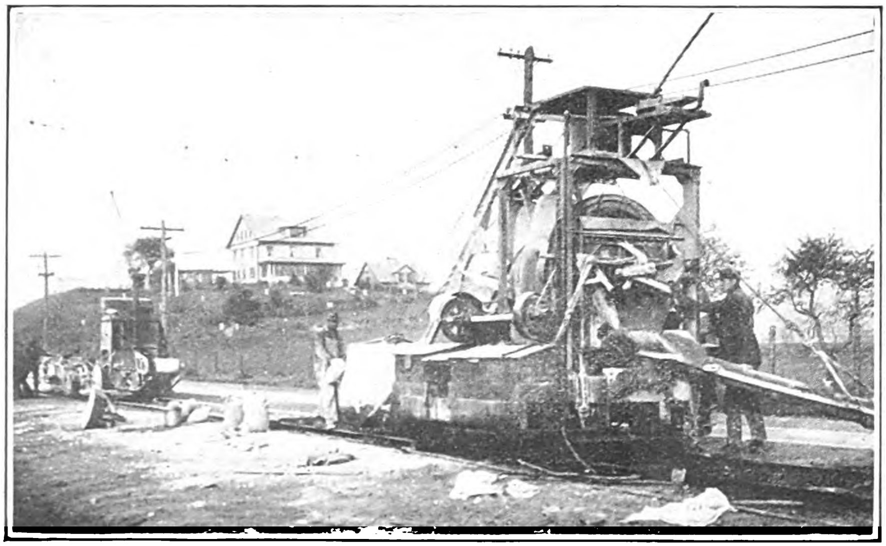


Sheet Steel, Reinforced Shield Protects the Fire Door from Materials and Equipment Which Might Render It Inoperative

Paving Old Track in Private Right-of-Way

UNTIL recently the tracks of the Boston Elevated Railway on Bright Road, Belmont, were in a reserved strip in the center of the roadway. A short time ago, however, it was desired by the municipality to pave the street, including the track area. The existing construction of the railway was with 70-lb. T-rail with bolted joints. Wood ties and rock ballast were used. The track structure was in good shape and it was felt that it was unnecessary to take it up or rebuild it when paving the streets. For this reason the company simply retamped the ballast and tightened up the joints. The latter was accomplished by driving wedges between the rail end and spot welding them in position.

Concrete was then poured inside and outside of the rail right up to the level of the rail head. Flangeways were made by means of an arch-shaped wooden form placed between the rails while the concrete was soft and moved lengthwise of the track. In this way the desire of the municipality to have the entire street paved was accomplished without the necessity of expensive track reconstruction by the railway.



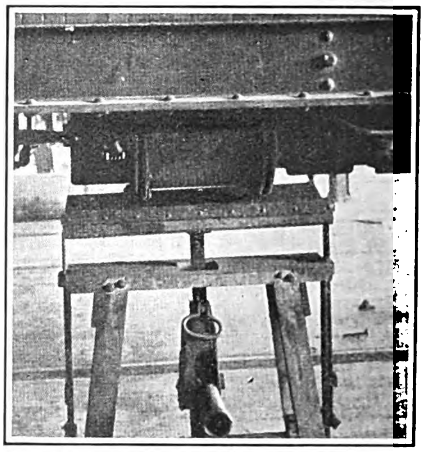
Laying a Concrete Pavement Along Tracks Which Used to Be on Private Right-of-Way

Jack for Brake Cylinder Mounting

By R. S. Neal

Assistant Superintendent of Equipment
Kansas City Railways

WHEN it is desired to change the brake cylinder on a car for any reason such as repairing or overhauling of the old cylinder, these heavy castings are found to be hard for even two men to handle. Even then it becomes necessary to block the cylinder up into place while it is being fastened to its supports. All this takes considerable time, makes it a difficult physical task, and in addition introduces an accident hazard.



Brake Cylinders Are Mounted or Removed Conveniently and Safely by Means of This Simple Device Constructed in the Shops of the Kansas City Railways

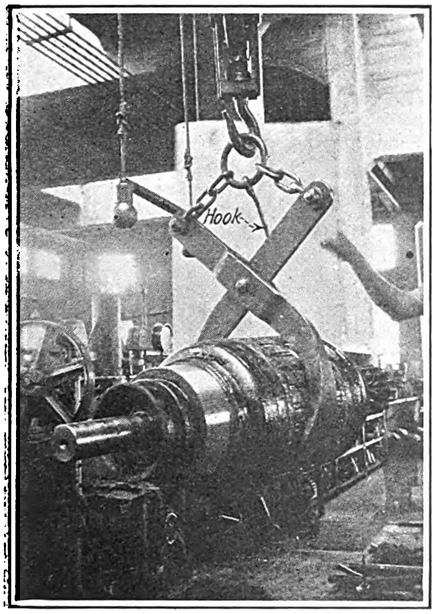
In the shops of the Kansas City Railways a simple and inexpensive jack has been designed and constructed for holding brake cylinders in position while they are being either removed or replaced on a car.

This jack is shown in the accompanying illustration. It is simply a trestle with a false top which can be either raised or lowered by means of an ordinary car jack. The false top is guided in its movement by strap-iron guides on the ends.

The 10-in. and 12-in. brake cylinders which are being installed on all cars of the Kansas City Railways weigh 200 lb. and 300 lb. respectively, and this jack has been found to be very convenient for the use of workmen when installing these cylinders.

Armature Tongs Speed Up Handling

MANY methods and devices have been developed in various railway shops for handling armatures from place to place. The specially designed pair of tongs which was developed by the mechanical department of the Twin City Rapid Transit Company has proved to be an unusually efficient tool for this purpose.

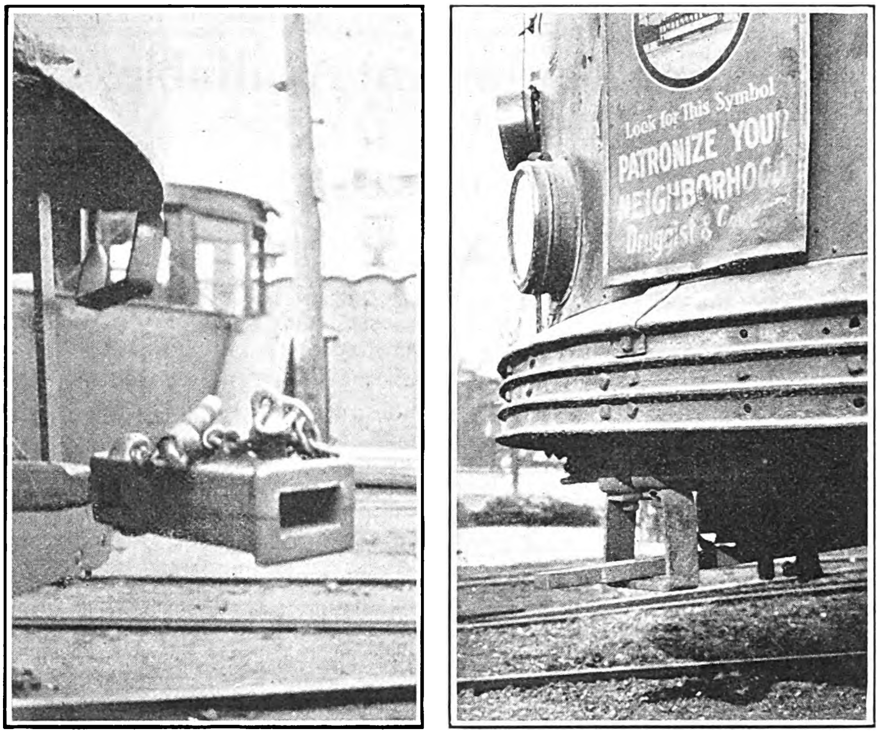


These Tongs Have Proved Very Useful for Handling Armatures About the Twin City Rapid Transit Company's Shop

These tongs are arranged so that they are simply dropped over the armature, and when raised by the two short lengths of chain and the ring above grasp the armature securely between the two curved jaws.

It is evident that an armature can be picked up from any position on the floor by means of this device, without the necessity of passing a band under the core, as is the customary method. When the armature is to be placed down on a bench or in a machine, the tongs are released as soon as they are relieved of the weight.

In order to keep the jaws open when the tongs are suspended without a load, a small hook is provided on the suspension ring shown at the ends of the two short sections of chain. This hook drops under the center joint and holds the jaws apart until the operator is ready to pick up an armature. By this arrangement the tongs are readily manipulated on a hoist or crane by one man, when moving armatures from place to place in the shop.

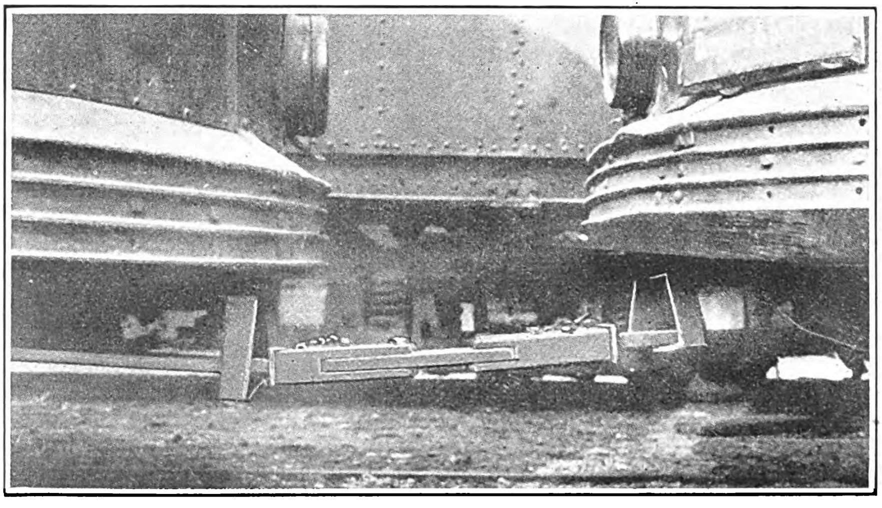


At Left, Old Coupling Head Which Protruded Beyond the End of the Car. At Right, the New Coupling Bar Does Not Extend Beyond the Bumper

Coupling Modification Reduces Accident Hazard

WHEN a change in the laws of the state of Massachusetts permitted the Eastern Massachusetts Street Railway to remove the old-fashioned fenders from its cars the change left the coupling heads protruding at the ends of the car in a way that was not only unsightly but also dangerous. A number of accidents occurred on account of these protruding couplings striking pedestrians on the street. To eliminate this danger the railway decided to remove the shackling blocks and use a shortened coupling bar which is entirely underneath the car platform, as shown in an accompanying illustration.

Each car carries two old coupling heads permanently held together by a short bar. They are loosely connected to allow freedom of movement. Cars are coupled by putting this piece between the two drawbars and dropping pins in place to take the tension. Two cars thus coupled are shown in one of the illustrations.

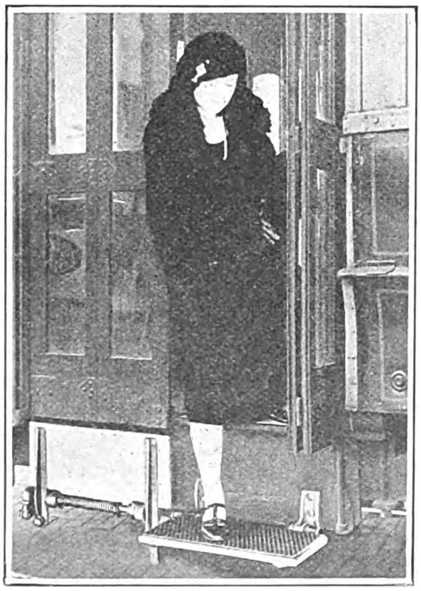


Coupler Composed of Two Coupling Heads and a Bar in Position Between Two Cars

New Equipment Available

Electric Treadle-Controlled Doors

TO MEET the demand for automatic control of exit doors by use of a treadle, the Consolidated Car Heating Company, Albany, N.Y., has developed a mechanism for controlling the operation of the door engines electrically. Standard electro-pneumatic control features have been applied to the treadle, the construction of which is greatly simplified through use of electro-magnetic valves. With this construction the treadle pan can be made very shallow, so that it can be set in a platform with the ordinary type of flooring construction without the need for extensive modifications.



Depressing the Treadle Automatically Opens the Exit Doors, Which Continue Open Until the Passenger Is Off the Step

In regular operation the treadle pan is held in its raised position level with the platform floor by springs. A passenger stepping onto the treadle presses it and forces the plunger of the electric door switch down so as to make contact; this energizes the magnet valve, admitting air to the door engine, so as to open the doors and lower the steps. The lowering of the step actuates another electric control switch, which closes a circuit in parallel with the magnet valve. The doors will then remain open as long as the step is held in its lowered position, even though weight is removed from the treadle, so it returns to its normal position. As soon as the passenger leaves the step, this is raised slightly by spring pressure and the electric switch opens the door engine circuit, so that the doors are closed and the step is raised. The closing motion is delayed sufficiently so that after the passenger has left the step there is plenty of time for him to get clear of the car before the door starts to close.

The accompanying illustration shows the treadle mechanism on a one-man, two-man car. In this case, the pair of folding doors next to the car body is used for exit. With one-man operation the treadle mechanism provides automatic control of the exit doors, while with two-man operation, both the entrance and exit doors are controlled by the conductor from his operating station.

Edgewound Resistor

A RIBBON-TYPE resistor, wound on edge, has recently been developed by the Monitor Controller Company, Baltimore, Md. The resistor unit consists of a high-resistance alloy ribbon wound in helical form and mounted on a steel-reinforced porcelain support which passes through the unit. This method of construction relieves the resistor ribbon from mechanical strain and permits of thorough ventilation. The ribbon can operate at any temperature up to red heat without sagging.

A system of terminals and taps enables a unit to be connected into a circuit and to be interconnected with other units. Two simple forms of clamps are provided. One is a bridging clamp which makes mechanical connection between two adjacent units and serves as a terminal when the units are connected in parallel. The other may be used as a terminal clamp or as a tap.

Monitor edgewound resistors are made in standard units and mounted in frames so that they can be employed like the usual cast-iron grids for use with car motors or wherever heavy currents are handled.

The News of the Industry

Favorable Move at Chicago

City and Companies Appear Now to Be Closer to Agreement on Some Points

The city of Chicago has receded from its previous position and has arranged to get a list of disinterested engineers to evaluate the surface lines, and possibly the elevated lines, with a view to purchase at the valuation price. The city did not commit itself to a deal, but the bankers went on record as recommending to traction security holders the acceptance of the city's notes, known as Schwartz certificates, in exchange for traction securities should the city buy.

Frank O. Wetmore of the First National Bank, who attended the semi-public traction conference of Dec. 2, stated to the committee of Aldermen that the bankers could not sanction a recession from the capital account value of the surface lines of $162,000,000, unless experts appraised the lines at less. With him were John J. Mitchell of the Illinois Merchants' Bank and Melvin A. Traylor of the First Trust & Savings Bank. Leonard A. Busby, head of the south side lines of the Chicago Surface Lines, also was present.

The city had offered slightly more than $142,000,000 prior to the conference. The appraisal was consented to with the provision that if agreement was made for a sale, the price should not exceed $162,000,000 regardless of any excess in the evaluation. This the bankers said was satisfactory. Alderman Fick was ordered to get city and traction lawyers together to agree on three engineers from a list submitted by R. F. Kelker, Jr., city traction expert.

Mr. Busby declared a satisfactory evaluation could be arrived at within six weeks from a list containing every item of surface lines equipment which is on the records of the Board of Supervising Engineers. The city, however, agreed to stand the expense of an appraisal.

Six public hearings beginning Dec. 5 were ordered with a view to getting the demands of each section of the city on record regarding the transportation facilities afforded each of the six zones in the city's traction plan.

Wages Cut in Bloomington, Decatur and Danville

Simultaneously with the wage reduction in Peoria, Ill., from a maximum of 57 cents an hour to 50 cents the wages in Bloomington, Decatur and Danville, Ill., were reduced a proportional amount. As these wage scales are based on the Peoria scale, the high rate in Bloomington was lowered from 50 cents to 47 cents and in Danville and Decatur from 51 to 49 cents an hour.

As explained in the ELECTRIC RAILWAY JOURNAL for Sept. 21, page 461, with the expiration of the contract between the Illinois Power & Light Corporation and the railway men in Peoria on May 1, the company entered into negotiations with the men for a new agreement. After conferences between the local manager at Peoria and a committee of employees, at which a satisfactory wage scale could not be agreed upon, it was decided to submit the question to an arbitration board of three members for decision. It required 90 days before the arbitrator for the company and the one for the men could agree upon the third member. Following another period of 30 days, during which time every phase of a "living" wage was considered, the board recommended a reduced wage scale. This recommendation was set for hearing on Sept. 15 and the wage reduction adopted as of Oct. 1. The new wage scale was not made retroactive to May 1, the time of expiration of the contract, but took effect on Oct. 1. During the period of negotiation and arbitration the railway men received the former rate of pay. The new agreement expires on May 1, 1925.

Investigator Becomes the Investigated

Tables Turned on Mayor Hylan, New York, Who Sought Partisan Arraignment of Commission—Grave Political Consequences Are Seen Ahead

TONGUES have been set to wagging again in New York over the transit situation. More traction letters are being written and they are attracting more attention than did the previous correspondence, that between Mayor Hylan and G. M. Dahl, chairman of the board of the Brooklyn-Manhattan Transit Corporation. It is not a matter of the vivacity of the correspondence, but rather the personalities of the participants and the seeming deep significance of the possible future political aspects of the matter. The participants are Mayor Hylan and Governor Smith.

In this connection a little local history may not be amiss for the especial benefit of those outside of New York not acquainted with the recent local political events. Governor Smith, a Democrat, was recently re-elected to office by a big vote. He was the only one of his party on the State ticket so put into office. Back of him are a Republican Assembly and a Republican Senate. Mayor Hylan, a political anachronism and a Hearst partisan, gunning for the scalps of the members of the New York Transit Commission, filed charges with the Governor against the commission alleging dereliction of duty and misconduct in office. He demanded that the commissioners be removed from office. It was really a pre-election backfire which the Mayor started.

Mark the celerity with which the removals might be accomplished—if the Governor was willing! There's the rub. All the Governor had to do or all that Hylan undoubtedly thought he would do would be to constitute himself a judge, summon the commissioners before him, question them and then if he saw fit dismiss them. The Governor pondered the matter for two weeks. At least, he didn't reply to the Mayor for that period. When he did, the answer he gave was one that startled the Mayor and set all New York to talking. Instead of following the procedure demanded by the Mayor the Governor named Justice McAvoy, another Democrat, as special commissioner to sit as referee with almost unlimited powers and "report the actual facts regarding the transit situation." He indicated that with that information before him he would determine how to proceed. That flabbergasted the Mayor. He then threatened not to play. More of that later. In naming Justice McAvoy, the Governor said:

> The transit problem in New York City has become a matter of sharp controversy between the city administration and the Transit Commission. Charges against the commission have been made by the Board of Estimate and filed with me. Other charges against the city administration made by the Transit Commission have appeared in the public press. The problem is acute. The present intolerable conditions must be remedied at the earliest possible moment. The people must have the facts.

It appears, according to Mr. Hylan, that the Governor completely misunderstood him. He says that neither he nor the Board of Estimate has requested "an investigation of anything." They are "substantial, formal charges" against the commission that the Mayor has filed. He has said so himself. Of them a trial was requested. At the end of a letter which took almost two solid columns of newspaper space, the Mayor says the Smith plan "neither has my approval nor will it have my participation, save to the extent required by law." He pretends to see ahead "an investigation from which nothing can come except reports and no decision." He wants in place of the present transit commissioners, of whom two are Democrats and one a Republican, "a commission free from present or former railroad or utility affiliation." He concluded:

> When news of your appointment of Judge McAvoy first came to me I assumed that he was named to hear and try the charges and I welcomed such appointment. I now understand from your reported statement that such is not the fact and he is only an investigator, and apparently I misapprehended the scope of the appointment.

Governor Smith was quick to reply. Best of all he did so in just 176 words.

The kick is all in the last 35 words. To the Governor it was quite clear that "the welfare of the people requires complete investigation to ascertain and report all the facts." Then came the 35 words, deeply significant in their portent. Arranged as the Governor put them they follow:

> I am confident that upon reconsideration you will change your decision to participate in the investigation only to the extent required by law and conclude to co-operate with Justice McAvoy fully in the public interest.

On Dec. 5 the Mayor declared that he still believed that a general inquiry by a Moreland act Commissioner was not the proper procedure and that the proper way would have been to proceed under the Public Service Commission act so that proof of the charges against the commissioners might have been presented properly.

It is expected that Judge McAvoy will begin the inquiry as quickly as possible. It was said that he probably would begin to hold public hearings for the taking of testimony in the Aldermanic Chamber at City Hall immediately after the adjournment of the Appellate Division for the holiday period and would continue the hearings through the holidays.

As for the Transit Commission it is reported to be ready and waiting to lay all the cards on the table before an impartial judge. Big doings and more interesting reading about the seven years of delay during the Hylan hierarchy appear to be ahead.

George Van Slyke, who writes politics for the *Sun* and is regarded as being unusually well informed on his specialty, said in the *Sun* for Dec. 3 that Mayor Hylan by his repudiation of the transit investigation by the Governor "has brought Tammany Hall to the verge of the greatest political warfare New York has experienced since the historic battle between Charles F. Murphy and Mayor McClellan 20 years ago." Mr. Van Slyke said in part:

> The Hylan bolt has shaken Tammany Hall from cellar to attic, but the leaders appear to be standing together today in their demand that Smith go through with the investigation regardless of the outcome. Not the slightest doubt was entertained anywhere that such a clash could mean only a knockdown fight between the Smith-Tammany and the Hylan-Hearst factions.
>
> The Mayor will not risk losing his pet issue by submitting it to the test of an impartial investigation. His plan of action is made clear. He seeks to buttress his position by ousting the Transit Commission, getting control of a new commission and putting through his own scheme of transit with a city owned and operated line and extensive bus routes.
>
> The Mayor is fighting with his back to the wall. He is desperate, and even his political enemies are crediting him with displaying real courage in risking an open fight with Tammany on uneven terms. Should the split come it will mean the alignment of Tammany Hall and its allies in the several boroughs on the Governor's side, and Hearst, Copeland and a remnant of the Democratic organization in Brooklyn, Queens and Richmond on the Mayor's. The test would come probably in the primaries, when Hylan would appear for renomination against a candidate picked by Smith and Tammany.

Hearings on New York Central's Electrification Projects

The Public Service Commission of New York has fixed Dec. 15 for a hearing on the application of the New York Central Railroad for approval of equipment and location to bring about the necessary electrification of its road other than the west side tracks, in New York City, as required by the Kaufman law of 1923. The hearing will take place at 30 Church Street.

Proceedings for the electrification of the company's freight lines on the west side of New York are now under way before the commission, which has authority over changes which may be necessary to street grades in New York City prior to the approval by the commission of the electrification plans.

The hearings scheduled for Dec. 15 are on the proposed electrification of the Putnam division of the New York Central, from Sedgwick Avenue, the Bronx, to Getty Square, Yonkers, and the Port Morris branch on the Harlem division.

On Dec. 16, at 30 Church Street, New York City, the commission will conduct a hearing on the petition of the New York Connecting Railroad Company for the electrification of its tracks within the city of New York from Bowery Bay Junction on Long Island to Fresh Pond Junction.

Madison Railways Must Have More Income for Improvements

Dudley Montgomery, vice-president of the Madison Railways, Madison, Wis., at a recent meeting in the office of the Railroad Commission made it clear that more income must be derived in order to carry out the program of improvements, and that the only source of revenue was the street car fare. The prospective improvements were outlined in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 25, 1924. Company officials declared that they had not decided on any fixed increase in fares, but all were satisfied that the recent audit of its books made by Harry H. Wilson, accountant of the commission, confirmed the need for more income to insure further development of the system.

Officials of the company volunteered the information that the employees had not been fairly treated on the wage question during the past 10 years, not because the company did not realize that they were entitled to higher pay but that with the present income it was impossible to pay any more. Several years ago the men accepted a reduction of 3 cents an hour after it had been explained to them that a cut was necessary if the system was to be kept in operation. Officials of the company are now anxious to grant an increase to the men. The average salary paid to the employees is $135 a month. Men are not paid for their days off and they are not allowed vacations with pay.

To carry out the physical improvements called for in the plan would cost approximately $700,000. The program is to be spread over a period of 7 years and the major portion of the expense is to come out of the company's revenues. The audit of the railroad commission for the year ended Aug. 31 last showed a net income of $36,934 before providing for depreciation. A large amount of the net income must be used to pay off loans which have been made in order to carry on improvement work, and according to the company officials practically only $7,000 would be left for the program as outlined.

Various types of fares were discussed at the meeting. Officials of the company informed the committee that three-fifths of the income of the company was derived from cash fares and two-fifths from the sale of tickets. The company now sells nine tickets for 50 cents. The cash fare is 6 cents.

Foreign Bus Lines Entering Detroit to Be Regulated

Action is to be taken by the city of Detroit to regulate the increasing number of bus lines entering the city. Steps looking toward this end were first advocated by John W. Reid, Commissioner of Public Works. Interest in the matter on the part of city officials was aroused by the announcement that the Detroit United Railway would transfer interurban passengers at the city limits to buses which will be operated to downtown Detroit in place of the interurban cars. The idea of the railway is that the buses can make better time inside the city than can the interurbans. A hearing is to be held on the matter.

The D. U. R. already operates a bus line from its downtown station to Trenton and several bus lines are operated from points downtown to suburban cities. Temporary revocable permits were issued to these operators by the Detroit Police Department. It is the opinion of John C. Lodge, president of the City Council, that the city must regulate these buses and be properly compensated for the use of the pavements.

The withdrawal of the D. U. R.'s interurban cars from the city will result in a loss of revenue to the Street Railway Department as the railway now pays the City Department rental for the use of the municipal tracks. It is proposed by Mr. Lodge that a tax be considered by the Council, similar to the one required from companies operating buses within the city. One cent per bus-mile is collected by the city from the Detroit Motor Bus Company. This tax is considered as part compensation for the wear and tear on the city pavements. It is levied against other bus companies operating in the city.

The fixing of routes for the buses is also to be considered.

Accidents Reported

No fewer than four accidents have been reported within the past few days from various parts of the country. On Nov. 30 six persons were injured in a fire in a one-man car of the Public Service Railway at Kearny, N. J. The following day 18 persons were hurt when a bus of the same company was overturned through the recklessness of the driver of a private automobile. On Dec. 4, as a result of a collision between a one-car train of the Sacramento Short Line and a three-car Key Route System train in Oakland, six persons are reported dead and seven probably fatally injured. The day before that five people were burned to death in a fire which followed a collision between a two-car interurban train and a motor truck in Wyandotte, Mich., the truck being loaded with turpentine, which took fire.

Jitney Candidate Defeated at Springfield

Fordis C. Parker, Republican, was elected Mayor of Springfield, Mass., on Dec. 2 by 925 votes over Robert W. King, Democrat, with Josiah Dearborn, independent, and Richard J. Talbot, jitney candidate, weakly trailing. The vote was as follows: Parker, 9,691; King, 8,766; Dearborn, 3,780; Talbot, 2,583. It was an exciting contest, and Parker's victory was clinched only by the last three precincts reporting. The vote, 26,935, nearly doubled that of any preceding city election. Mr. King, a young lawyer, made a most remarkable bid for the office.

The election is of special interest because all four candidates had committed themselves on the transportation subject, particularly with respect to the future place of the bus in the city. As a matter of fact, one of the candidates, as explained in the ELECTRIC RAILWAY JOURNAL for Nov. 15, page 857, is counsel for the jitney men ruled out of Springfield last May by Mayor Leonard.

Mr. Parker, the successful candidate, takes the stand that the first duty of the city is toward the street railway. Previous to his nomination he said that if he were elected it was his idea to appoint an expert to look into the transportation situation, but that he would favor a return of the jitneys only if it were shown that the Springfield Street Railway did not appear disposed to do all it could to furnish such service.

Co-ordination Talk Continued in Chicago

Universal transfer negotiations are going forward between the Chicago Surface Lines and the elevated roads. Samuel Insull, chairman of the board of the Chicago Rapid Transit Company, announced this fact to the City Council committee on local transportation. Like Henry A. Blair, head of the Surface Lines, Mr. Insull has submitted himself to questioning in an effort to help the city frame a traction policy.

Mr. Insull joined in Mr. Blair's contention that co-ordination of the lines is necessary, but he differed from Mr. Blair as to the extent. The universal transfer negotiations are a definite step toward his idea of co-ordination. It is expected the companies will soon announce whether they can make the plan practicable from a financial standpoint.

The scheme embraces 136 points where passengers would be permitted to transfer between elevated trains and surface cars. Whether this can be accomplished with a single fare or whether a transfer charge or a higher rate of fare would be necessary are points for the experts to determine.

Mr. Insull took occasion to rebuke the city for not acting on his request for authority to build $23,000,000 of extensions in outlying and crosstown districts and to lengthen platforms in the loop district so as to accommodate 8-car trains. He said he had ordered 100 subway-type cars costing $2,300,000 for delivery next fall. This will permit a 15 per cent increase in loop service.

If the city builds a subway, Mr. Insull will increase rush-hour service from 1,200 to 2,400 cars an hour. He said private companies will give the city all the transportation it needs if the city will cease its dilatory consideration of petitions. As to city ownership of lines, he said: "Take away the incentive for profit and you lose efficiency."

It was Mr. Insull's first appearance in seven years before a body of this kind and he did not lose the opportunity to demand fair treatment from the city. He objected especially to Mayor Dever's reiterated statement that the elevated lines cannot get the money for extensions. Mr. Insull said:

"Credit is like a woman's reputation; a whisper and it's gone. Quit talking and give us the authority and you will get rapid transit enough in a hurry."

3,000,000 Messages Distributed in Philadelphia

Three "Read as You Ride" Service Talks were distributed during the week ended Nov. 22 on the cars of the Philadelphia Rapid Transit Company, each for a period of two days. Each approached the 1,000,000 mark in distribution. Dash signs were used in calling attention to the message. They were entitled "Better Wages, Better Service," "Your Fare and Others" and "Why No Fare Boxes." In each case the admonition was added: "Ask for Service Talks."

Railway Preferred to Bus in Eastview, Ont.

The ratepayers of Eastview, Ont., voted on Dec. 1 in favor of granting a franchise to the Ottawa Electric Railway by a majority of 247 over that in favor of granting a franchise to the Eastview Transit Company for the operation of buses. The railway has offered to lay the tracks for a distance of 1½ miles without cost to the town and to charge a fare of 10 tickets for 25 cents to city limits. It was agreed that if the city of Ottawa at any time purchased the company's lines the town of Eastview would be given the opportunity to purchase at the same terms and for the actual cost of the line within the town limits. The Eastview Transit Company offered to run four buses from ½ mile east of the town limits to the Ottawa main post office, 2¾ miles, at a 5-cent fare and a 10-cent rate on Sundays. The bus and railway tangle in Eastview has been referred to previously.

New Agreement in Dallas Expected

The present arrangements between the city of Dallas, Tex., and the Dallas Railway whereby a 6-cent fare is charged in the city will expire on Dec. 27. Unless a new agreement is made and authorized by a city ordinance the fare will automatically return to 5 cents as specified in the city charter. It is expected that an application for a continuance of the 6-cent fare will be filed shortly by the company.

The present 6-cent fare was extended for 18 months from June 27, 1923, on condition that the railway spend $705,915 in extensions, rebuilding and repairs and in the purchase of 30 additional cars during that period. This proposal made by the City Commission is known as the Everman Plan No. 2. The agreement constituted an understanding between the city officials and the traction company and was negotiated by John W. Everman, supervisor of public utilities for the city. At the time the extension was authorized it was agreed that the improvements and extensions would not be required until after the completion of improvements in the Everman Plan No. 1 of 1922, which gave the company eight months for completion of the program.

The railway extensions that may be projected now as a commitment on the part of the company for the increased fare have not been made public, but have been under discussion. When the agreement expires on Dec. 27 the railway is to take over operation of the Trinity Heights line from the Texas Electric Railway under the franchise agreement.

One-Man Operation Started in Cleveland—Arrests Made

One-man car operation on important lines in Cleveland, Ohio, during non-rush hours was started by the Cleveland Railway on Dec. 1. It was followed immediately by arrests of the operators by authorities in the city of Cleveland, Lakewood and Newburgh Heights, who invoked police ordinances forbidding running of street cars with fewer than two men. During the first two days of operation twelve of the operators were arrested, but the Cleveland Railway insisted that one-man operation would be thoroughly tried. The hearings for those arrested are to be held within the next two weeks. The city ordinances prescribed penalties of fines ranging from $5 to $25 for each violation.

Railway men insist that one-man car operation was started as an economic measure because not sufficient funds are allowed for two-man operation on lines that are losing money. Secretary Wilson said that if operation of one-man cars interfered with or impaired service, they would be discontinued.

An interesting feature of the arrest of the operators lies in the fact that if any of them are fined, the fines will be paid by the railway out of the pockets of the car riders, because under the Cleveland arrangement, any money made by the company over and above the 6 per cent paid to stockholders goes into a fund to reduce or increase fares.

Aldermen Act Against One-Man Cars in New Haven

Primarily for the purpose, it seems, of determining the extent of the jurisdiction of the city of New Haven, Conn., over the railways operating within its limits, an ordinance to this effect was passed by the Aldermen on the evening of Dec. 1, which would ban the use of one-man cars. Up to Dec. 3 the measure had not been approved by the Mayor. It is pretended that the purpose of the ordinance is "to prevent accidents in the streets of the city and the highway district of New Haven, facilitate traffic therein and preserve good order and secure the safety of persons using the city streets."

In passing the act the Aldermen proceeded on the advice of Assistant Corporation Counsel Thomas R. Robinson. The intention of the Connecticut Company is to appeal to the State Public Utilities Commission for relief from the terms of the measure if the Mayor signs the ordinance. Its contention is that the city has no such power as it is now seeking to wield.

This is not the first time that a similar issue has been raised in Connecticut. Last January the Council of Hartford passed an ordinance against the use of one-man cars in which the time limit was fixed at July 15. When the expiration date rolled around a resolution was passed giving the company permission to continue one-man cars until it received a month's notice to withdraw them. It was pretended at the time by the city that the ouster measure was involved with a tax measure then pending determination by the courts.

The position of the railway in that case was the same as it has taken in connection with the New Haven matter, namely, that the Public Utilities Commission has jurisdiction.

Suit to Reduce Nashville Fare Fails

Chancellor John R. Aust recently dismissed the bill filed in Chancery Court by a citizen in which it was sought to enjoin the Nashville Railway & Light Company, Nashville, Tenn., from charging a 7-cent fare. In dismissing the bill the chancellor said that reliance was put solely on a city ordinance which fixed the fare at 5 cents, but no reference had been made to the act of the General Assembly creating the Utility Commission, nor did the complaint raise the question of the validity of that act.

The opinion further stated that the railway rested its defense upon the order of the commission which, after a full hearing, permitted the railway to charge and receive a 7-cent fare; that the commission's order must stand unless the ordinance of the city is superior to the legislative act, or the act is contrary to the constitution of the state or of the United States. Chancellor Aust said that it would be an anomaly if the city could deprive the people from exercising jurisdiction through a legislative body.

He referred to the situation in Memphis, where the order of the commission there permitting a 7-cent fare had the effect of overriding and of superseding an ordinance of that city fixing the fare at 5 cents.

New Franchise Proposed at St. Louis

A new franchise from the city of St. Louis to cover a period of 50 years is proposed in the interest of the successor company to the United Railways. Mayor Kiel wants the franchise bill to go through as initiated by the people. He apparently doesn't want the responsibility of accepting a franchise for the city. As Mr. Kiel is a tentative candidate for re-election to a fourth term as Mayor his attitude is regarded as most important. The Mayor and fourteen Aldermen come up for re-election in April. Fourteen other Aldermen and President Walter Neun of the board hold over for two more years.

The new franchise will provide for service at cost and a co-ordinated bus and railway line. Provision will also be made for the subway system the city contemplates building. The railway is expected to agree to use the subways on a leasing arrangement, the city to furnish the capital to build them if present plans are consummated. The city is making a survey to ascertain the best means of solving its rapid transit needs. A special aldermanic committee has recommended the expenditure of $100,000,000 for a subway system in the congestion sections of the city.

The city under the new franchise measure would have direct representation on the board of directors of the railway and it is very probable that a plan for a gradual purchase of the system by the city will be worked out.

A special election on the franchise together with the cost of conducting an educational campaign would probably run the bill to $100,000. It is regarded as imperative to vote on the bill on a day different from the one on which officials are elected to public office in order to keep the element of politics out of the election. In any event it would probably be impossible to prepare the franchise measure in time for submission at the Spring election. While the various financial interests have accepted the plan for the reorganization of the railway many steps remain to be taken before the franchise can be acted upon. The present franchises expire in about 15 years.

The program of the reorganization committee provides for full, open and public discussion of all questions involved in the new franchise.

Bus Fares in Michigan Advanced —Accounting System Likely

The Michigan Public Utilities Commission recently authorized a temporary fare increase of half a cent per passenger-mile on buses operated between Detroit and Pontiac by the Star Motor Coach Company, between Detroit and Mount Clemens by the Wolverine Motor Bus Company and on the electric cars of the Detroit United Railway's Pontiac and Mount Clemens divisions. The new rates went into effect on Dec. 1. They represent half of what the three companies asked in their recent petition. It is said that the 1½-cent mileage rate just instituted was a makeshift order because of lack of evidence submitted at the recent hearings. It is expected that the commission will order the bus companies to install a system of accounting more complete with respect to details so as to enable the regulatory body to learn exactly how much loss or profit per passenger-mile is being encountered.

Promptly following the decision of the commission fixing the temporary rate of fare the Detroit United Railway announced its plans for the co-ordination of bus and rail service wherever possible. The trolley and bus service between Detroit and Pontiac will be co-ordinated. The rail fare will be a straight fare at the rate allowed, while the bus fare will be in increments of 5 cents. The minimum rail fare is 5 cents and that on the buses 10 cents. The Detroit United is now charging 1 cent a mile on its Pontiac and Mount Clemens Division and has a petition before the commission for authority to charge 2 cents a mile.

Elliott G. Stevenson, president of the Detroit United Railway, recently stated in connection with the proposed fare advances for Mount Clemens and Detroit that the business rivalry between the railway and the interurban bus lines had led to a service very much in excess of that warranted by the combined volume of business, and at a rate of fare wholly inadequate to meet the costs of doing business. He said that the result had been a severe financial loss to both railway and bus operators. This, he said, had been particularly emphasized in the deterioration of bus equipment, most of which would have to be replaced.

Philadelphia Rapid Transit to Participate in Terminal Plan

Plans have been made for conferences between the Pennsylvania Railroad and Philadelphia Rapid Transit Company officials regarding the inclusion of elevated and other transit lines in the new railroad station. The intention is to remove the road's station to the west bank of the Schuykill. This plan involves the initial expenditure of $40,000,000 by the Pennsylvania Railroad and $12,000,000 by the city.

In this connection the Philadelphia *North American* has revived the story about plans for electrification of the principal divisions of the Pennsylvania Railroad. It says that this work will be started as soon as business conditions develop to a point where the financing of the giant project can be properly handled. It is probable that with the beginning of the work on the proposed new railroad terminal on the west bank of the Schuylkill River the railroad will institute the necessary preparations for the electrification of its lines between New York and Washington and across the Allegheny Mountains. The first step on the New York and Maryland divisions will be the use of electricity between this city and Wilmington, to be followed rapidly by transformation of the line between New York and Bristol.

Rules Governing Bus Operation Tightened

The Public Service Commission of New York has issued an order providing for certain safety equipment on buses after Jan. 1, 1925. The order reads as follows:

> The commission being of the opinion that public safety requires that gas tanks on buses operated on stage routes, bus lines and motor vehicle lines shall be located outside the body of said buses, and that an emergency exit is necessary on certain types of buses, it is
>
> Ordered that no person or corporation owning or operating a stage route, bus line or motor vehicle line under a certificate from this commission, granted pursuant to the provisions of the transportation corporation law shall, on or after Jan. 1, 1925, operate motor buses, unless said buses shall be equipped in accordance with the following requirements:
>
> 1. The gasoline tank shall be located entirely outside the body of the bus with an inlet for filling which shall permit filling from the outside exclusively.
>
> 2. In those buses having longitudinal seats or a longitudinal aisle between seats, in which there is a common exit and entrance, there shall be provided an emergency exit door located at the opposite end of the bus body from the regularly used entrance and exit, which emergency door shall be securely fastened in a manner which will prevent it being opened except when opened for emergency purposes.

The Public Service Commission has also prepared a set of rules applicable to operators of buses throughout the State of New York. The commission in 1922 required that all persons or corporations operating bus lines should adopt regulations for the guidance of employees, but the new rules of the commission provide for uniformity throughout the state.

Rules have been promulgated by the commission covering every phase of the employees' duty, divided under four general heads—general, personal appearance and conduct, garage rules and operation. Disregard of orders, violation of rules or neglect of duty will always be considered a sufficient cause for dismissal or discipline.

Emphasis is placed on the rule that all buses must be brought to a dead stop before crossing a railroad.

Buses must be operated under a schedule and under no conditions pass schedule points ahead of time; in case of delay operators may not make up lost time by reckless driving.

It is provided that operators before leaving the garage or when relieving another must inspect the motor bus to determine the amount of gasoline in the tank, amount of oil in the engine case, amount of water in the radiator, condition of fare box and tell-tale, condition of service brake, condition of emergency brake, condition of lights, cleanliness of interior of bus, and presence of a fire extinguisher. A record of such inspections must be kept on a daily inspection card provided for that purpose. All defects observed must be immediately reported.

Another rule provides that the maximum standing passenger load must not exceed 35 per cent of the seating capacity. Running lights must always be displayed at least 15 minutes before sunset and at such other times as existing conditions may require. In conclusion the order says:

> The safety of the passengers must at all times be the first consideration. Employees must exercise constant care to prevent injury to persons and property and in all cases of doubt must take the safe course.

In case of accident injured persons must not be left until arrangements have been made for proper care, and verbal and written reports of every accident must be made by the operator.

Copies of these rules will be mailed to all bus lines as soon as printed.

Subway Draft Under Way in Philadelphia

City Solicitor Gaffney of Philadelphia announced on Dec. 1 that the draft of an agreement between the city and the Philadelphia Rapid Transit Company for the building of the Broad Street subway would be submitted to the Mayor's Transit Commission before the Christmas holidays. It was made clear that under the terms of the loan bill through which funds for both projects were made available, $10,000,000 is definitely set aside for the Chestnut Street subway, while $67,000,000 is just as specifically allocated to the Broad Street line.

In the proposition submitted to the city several weeks ago by railway officials the company undertook to pay the interest and sinking-fund charges on a $50,000,000 50-year loan for the construction of the Chestnut Street subway. If work were begun at once, it was pointed out, the tube would be completed and ready for operation sooner, perhaps, than the Broad Street subway, which is scheduled to open late in 1928.

The proposition was placed in the hands of the Transit Commission by the Mayor and in turn the City Solicitor, the Transit Director, and Mr. Swaab were delegated to consider the drafting of an agreement which the city might present to the company.

Engineers Expected to Report Soon in Los Angeles

The comprehensive report of Major R. F. Kelker, Jr., outlining a complete rapid transit system for metropolitan Los Angeles, is scheduled to be filed with the Board of Public Utilities about Jan. 1. It is also expected that about the same time the board and the State Railroad Commission will receive the report of Richard Sachse and Chief Engineer J. O. Marsh, covering the proposed merger of the electric lines. A statement made by one of the commissioners said:

> Major Kelker's report will embody a practical working plan under which there will be no need of waiting for the city to vote a $100,000,000 bond issue in order to carry out the program. A rapid transit system will be recommended which can be established in units, and a financial program will be submitted so the city can begin at once on the system as soon as the plans have been approved by the proper authorities.

The report of the special engineering committee will recommend the formation of a holding company to operate the two lines until municipal ownership is an accomplished fact. If this is not found practical at the earliest possible moment, both Engineer Sachse and his associates are said to favor the purchase of the Pacific Electric metropolitan lines by the Los Angeles Railway.

Sixty-three Buses Wanted by Kansas City Receivers

The receivers of the Kansas City Railways, Kansas City, Mo., favor the purchase of 40 single-deck, 18 double-deck and 5 de luxe buses for use in service supplementary to the railway lines. Action to this effect was recommended in a report filed on Nov. 29 with Judge Kimbrough Stone. Judge Stone is asked to permit the purchase and service providing the railway obtains protection against bus competition from the city administration.

The report to Judge Stone is signed by Francis M. Wilson and Fred W. Fleming, the receivers. Its presentation follows a series of public hearings. Ten routes are recommended as follows:

> Four main lines in Kansas City, Mo.
>
> One parlor car line in Kansas City, Mo.
>
> Three cross-town, or feeder, lines in Kansas City, Mo.
>
> Two cross-town, or feeder lines in Kansas City, Kans.

A 10-cent fare would be charged on all lines except the parlor car line, on which a 25-cent fare would be required.

Transfers from cross-town lines to street cars would be permitted. Transfers from street cars to cross-town lines would be permitted with the payment of an additional 3-cent fare. No transfers to or from main line buses would be permitted.

Judge Stone has instructed the receivers to negotiate at once with the city to secure franchises that would protect its proposed investment in buses. When these reach a point where the court considers such an order justified it is expected that the receivers will be instructed to buy buses and begin service.

Will Suspend Auto Parking Agitation.—The subject of the degree at which automobiles shall be parked in the business district of Oklahoma City, Okla., is to be allowed to rest indefinitely, according to announcement of the Retailers' Association after a conference with John W. Shartel, president of the Oklahoma Railway. The merchants prefer 45-deg. parking as it permits more automobiles to park in the business district. The company prefers parallel parking as it reduces automobile monopoly of the company's rails to a minimum. The rule at present in effect is for 20-deg. parking, which Mr. Shartel says is a very substantial benefit to the company and the public using its cars, traffic having been speeded up materially and accidents substantially reduced in number since this rule became effective.

Jitney Lines Attacked.—Citation has been issued by the Alabama Public Service Commission, naming as respondents 32 individuals in Huntsville, and four bus and taxi lines in Gadsden, Attalla and Alabama City, requiring them to show cause why they should not be required to discontinue operation of jitney service for alleged failure to comply with the laws of the state. Under the Alabama law, when a jitney or motor vehicle is operated in competition with a railway, application to operate such jitney must be made to the Alabama Public Service Commission for a certificate of convenience and necessity.

Nine-Cent Fare in Effect.—The Des Moines City Railway, Des Moines, Iowa, instituted a 9-cent cash fare with a ticket rate of 8.5 cents Nov. 30. The rate for children, school children and owl car service is unchanged. F. C. Chambers, general manager of the company, reported that the stabilizing fund of the company, which was to be maintained at $150,000, had not only fallen below the $100,000 mark, which automatically brought a fare readjustment, but that it had been depleted, and that to meet operating expenses, fixed charges and taxes a loan of $25,459 had been incurred.

Acquires Bus Lines.—The Columbus, Newark & Zanesville Electric Railway, Springfield, Ohio, has acquired the bus lines operating in the city of Newark for $40,000 and will continue their operation with new equipment and universal transfer privileges on a 6-cent fare. The City Council recently passed an ordinance granting a 25-year franchise to the company. It was vetoed by the Mayor and passed over his veto on Nov. 17.

Bus Operation for Lockport. — The International Railway and its subsidiary, the International Bus Corporation of Buffalo, N. Y., have informed the City Council of Lockport that they will apply for a franchise to operate buses in Lockport as part of a new interurban bus line service from Buffalo, Lockport and Olcott Beach. A committee has been appointed by the Lockport Mayor and Board of Commerce to confer with President Tulley of the railway on the proposed bus line.

Granted Fare Increase. — Fare charged bv the Chickasha Street Railway, Chickasha, Okla., was increased from 7 cents to 8 cent effective Dec. 1 in accordance with permission granted by the State Corporation Commission following a hearing Nov. 26. The application for the increase was not opposed, the company's request having been indorsed by the Chamber of Commerce and the City Council. The Chickasha Gas & Electric Company, co-operating to keep the electric railway operating, has granted a substantial reduction in the price of power to operate the line.

Seeks Higher Fare.—The Manchester Street Railway, Manchester, N. H., announced on Nov. 22 that it would seek permission to increase cash fares from 8 to 10 cents. If granted, the increase will become effective Jan. 1. General Manager J. Brodie Smith claims that during the last six months the company has operated at an average loss of $10,710 a month. Ten months of this year, ending Oct. 31, show a loss of 1,093,646 passengers compared to the same period for 1923.

Will Accept Bus Lines.—The proposal of the Quincy Street Railway. Quincy. Ill., to substitute bus lines on State and South Eighth Streets for the car tracks will be accepted by the municipal authorities as a solution of the repaving problem which has been in contention between the traction line and the city. The railway has 3 miles of track on South Eighth and State Streets and to tear up the present lines, relay and repave would cost $120 000. The company, however, has agreed to pave between its tracks on lines on Chestnut Street from Eighteenth Street to Twenty-eighth Street. Ralph F. Carley, western division manager for the Illinois Light & Power Company, represented the public utilities in the conferences.

Ordinance Against One-Man Cars Unlawful.—Efforts on the part of the City Council of Buffalo to prohibit the operation of one-man cars on local lines of the International Railway are opposed by the city law department, which has handed down a decision saying such an ordinance would be unlawful. It was proposed to provide a penalty for violation of the proposed ordinance of fines of $100 to $250 for each offense. A ruling by the Public Service Commission on the operation of one-man cars in Buffalo is expected within the next week.

Alton Company Seeks Franchise.—The Alton, Granite City & St. Louis Traction Company, which charges a city fare of 10 cents in Alton, Ill., has proposed to the Alton City Council a reduction in fare in return for a 20-year franchise to operate on Broadway, Alton. The Broadway line has been operating without a franchise for some time. The Council has passed several new franchise bills which the company has declined to accept because of the special taxation provisions of the measures. The franchise proposal was made in the name of the receiver of the railway.

New Company to Operate Buses.—The Spartanburg Bus Company, a subsidiary of the South Carolina Gas & Electric Company, Spartanburg, S. C., has been granted a charter. Officers of the company are, R. L. Peterman, general manager of the Barstow interests in South Carolina; vice-president, J. H. Axtell, assistant general manager of the South Carolina Gas & Electric Company, and secretary and treasurer, A. S. Jolly, treasurer of the South Carolina Gas & Electric Company. The company is to be financed by the W. S. Barstow Management Association.

Will Operate One Man Cars.—Directors of the Fitchburg & Leominster Street Railway have decided to put one-man cars into operation on the company's line between Fitchburg and Ayer, Mass. President Wesley W. Sargent in disclosing the plan said the change was made to economize during the winter when traffic was light. The change will mean a considerable cut in expenses. This is the fifth line of the company to change two-man to one-man type of car.

Fight for Lower Rates.—The beach cities served by the Pacific Electric Railway have started action to bring about the improvement of interurban railway service from Los Angeles to Redondo, Venice, Ocean Park, Santa Monica and Alhambra. The cities at the same time demand a tariff reduction of approximately 40 per cent. A committee of fifteen has been appointed composed of representatives from all the cities affected. The petition, it is expected, will be filed with the State Railroad Commission by the end of this month.

Foreign News

Mexican Railway Being Electrified

Electrification of the branch line of the Mexican Railway between Esperanza, Puebla and Orizaba, Vera Cruz, a distance of 29 miles, is now in progress. The contract was secured by an American company, but the actual construction work is being done by the Mexican Railway under the supervision of American electrical engineers. The work is up-grade from 4.7 to 5.25 per cent.

The overhead construction will cost approximately $250,000; the substation, $250,000, and 10 electric locomotives, $1,250,000. The substation will be equipped to convert a 42,000-volt, 60-cycle, three-phase, high-tension alternating current into a 3,000-volt direct current. Power will be furnished by the Puebla Electric & Power Company, Tuxpan.

New Electric Railway for Guatemala.—A contract for construction of an electric railway from Santa Maria to Quezaltenango, Guatemala, and a power plant at Santa Maria has been signed by the Secretary of Finance and Public Credit of Guatemala. The work will be done by the Allgemeine Elektricitäts Gesellschaft of Berlin. Bonds to the value of $3,000,000 will be issued by the government to finance the work.

Croydon Tramways to Be Reorganized.—Croydon Town Council, England, is planning to reorganize the municipal tramway system, in an effort to meet bus competition. Being only a few miles from London, the Croydon tramways are subject to severe competition of buses owned by private companies. Bids have been asked for 30 additional street cars.

Speed of London Tramcars.—The average speed of the London County Council tramways is 9½ m.p.h., including stops, according to a report made at a recent meeting of the Council. This is said to be the highest average speed on any street lines in Great Britain, comparing with 7.57 m.p.h. in Glasgow, 8.5 in Birmingham, 7.87 in Manchester and 8 in Liverpool.

London Officer Resigns.—Ivor Fraser, publicity manager of London underground electric railway companies, has resigned that office in order to become manager of the *Morning Post*, London. A. L. Barber, commercial manager to the companies, will for the time carry on also the duties of publicity manager.

Equipment Contract Let for Australian Electrification.—A contract has been secured by the Metropolitan-Vickers Electrical Company, Manchester, England, to furnish electrical equipment for 150 motor coaches and 150 trail cars to be used on the Sydney, Australia, suburban railways which are being electrified. The price is about £500 000. The equipment for each motor coach includes two 350-hp., 1,500-volt motors with electro-pneumatic control. The overhead contact system will be employed.

Financial and Corporate

$3,986,059 Net in Brooklyn

First Annual Statement of Successor to Brooklyn Rapid Transit Reflects Great Increase in Traffic

A net income of $3,986,059 is shown in the first annual report of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., for the year ended June 30, 1924. This is after the deduction of interest, rentals and accruals to minority interest. After allowing for preferred stock dividends paid during the year the company earned $3.23 a share on the 769,911 shares of no par common stock. The consolidated statement shows that there were paid for the fiscal year ending June 30, 1924, two quarterly dividends on the outstanding preferred stock of the Brooklyn-Manhattan Transit Corporation, aggregating $748,404. No other dividends were paid on the B.-M. T. stock nor any dividends declared by any of the operating companies during the fiscal year. The figures in the consolidated statement include the result of operation of the Brooklyn Heights Railroad, still in receivership.

The report gives a condensed summary of the results of operation under the contract with the city for the year ending June 30, 1924, and also for the eleven-year period from the commencement of the contract, namely, Aug. 4, 1913, to June 30, 1924. Referring to these figures the report states that they indicate the extent to which, both for the year just closed and the period from the commencement of the contract, the operations of the rapid transit lines under the contract of the city on a 5-cent fare have failed to earn the stipulated return of interest and sinking funds of the company's and the city's contribution to the construction and equipment of the new line.

The contract with the city provides that the revenues derived by the company from the operation of the city-built and the company-owned rapid transit lines are to be pooled and from such pooled earnings certain deductions are to be made in the order specified, the balance being divided between the city and the company in equal parts.

The contract provides that the company is to receive out of the pooled earnings the stipulated interest and sinking fund on its investment before the deductions are made in favor of the city. The deductions stipulated in the contract are, in condensed form, and in the order of priority, as follows:

(1) Operating deductions, including rentals, taxes, operating expenses, maintenance and depreciation;
(2) The company's first preferential of $3,500,000, representing the average annual income for 1911 and 1912 from the operation of the company-owned rapid transit lines contributed to the pooled system, out of which the company must pay interest on its capital investment in such rapid transit lines;
(3) The company's second preferential of interest and sinking fund on its contribution to the cost of construction and equipment of the new lines and on cost of reconstructing and adding to existing lines;
(4) The city's preferential of interest and sinking fund on its contribution to the cost of constructing the new lines.

Each of these deductions is to be made in the order given and deficits in any period are to be cumulative and paid out of subsequent earnings before any deductions are made on succeeding items.

The relative volume of traffic handled on the rapid transit lines and street surface lines of the company is shown by the number of passengers carried for the year ended June 30, 1924, namely, on the rapid transit lines 539,069,076 and on the street surface lines 266,421,409. The great increase during the past seven years in traffic handled was shown in the report. In 1924 805,490,480 passengers were carried on both the surface and rapid transit lines compared with 520,969,604 in 1918. On the matter of traffic the report states that the problem is that of providing adequate facilities to handle the tremendous increase which is bound to result in the future under the limitations and restrictions imposed under the contract with the city.

In submitting the first annual statement of the company to the stockholders G. M. Dahl, chairman of the board of directors, gives the historical facts in connection with the organization of the property and the contract of the rapid transit lines with the city. He said that the city of New York had $150,000,000 invested in the subway and elevated lines leased to the New York Rapid Transit Corporation, which was controlled through stock ownership by the B.-M. T. He said that the prosperity or adversity of the subway and elevated lines was determined by the earnings of the New York Rapid Transit Corporation and not by the earnings of the Brooklyn-Manhattan Transit Corporation. The latter property has a substantial income from bonds and other indebtedness of the surface line companies owned by the holding company and those earnings contribute to the income of the B.-M. T. During the year ended June 30, 1924, the B.-M. T. owned 188,138 shares of stock of the New York Rapid Transit Corporation. During that same period, the revenues of the New York Rapid Transit Corporation failed by $5,148,948 to meet the annual interest and sinking fund of the company's and the city's investment.

STATEMENT OF EARNINGS AND EXPENSES FOR YEAR ENDED JUNE 30, 1924, BROOKLYN-MANHATTAN TRANSIT SYSTEM AND AFFILIATED COMPANIES

Revenue from transportation:	
Passenger revenue	$38,376,581
Freight revenue	650,172
Chartered car revenue	873
Miscellaneous transportation revenue	516
Total revenue from transportation	$39,028,144
Other street railway operating revenues:	
Advertising	$534,389
Other car and station privileges	297,475
Rent of buildings and other property	147,573
Rent of equipment	170
Rent of tracks and terminals	22,283
Miscellaneous receipts	42,289
Total other street railway operating revenues	$1,044,181
Total street railway operating expenses	$40,072,326
Operating expenses:	
Maintenance of way and structure	$3,742,677
Maintenance of equipment	5,671,801
Operation of power plant	3,428,726
Operation of cars—trainmen's wages	6,514,423
Operation of cars—other expenses	3,908,713
Damages	1,277,771
Legal expenses in connection with damages	174,478
General law expenses	105,333

Deficit representing amount by which revenue failed to equal interest and sinking fund on company's contribution to construction and equipment under contract	$1,072,029	$15,626,318
City's preferential representing interest and sinking fund on city's contribution to construction under contract, unearned and unpaid	4,076,918	32,917,231
Deficit representing amount by which revenues failed to equal company's and city's interest and sinking fund on contributions to construction and equipment	$5,148,948	$48,543,550

Hearing on Receivership Claims Closed

The second and closing hearing on claims growing out of the receivership for the Pittsburgh Railways, lifted last February, was held recently by former

Judge Henry G. Wasson, special master for the court in railway receivership matters. C. S. Mitchell, auditor, and Thomas Fitzgerald, general manager, for the railway, with others were heard, and Mr. Wasson announced he will now prepare his final report to the United States District Court, whose ward the railway was while in the hands of receivers.

It developed at one of the previous hearings that the receivers have paid no money out of the $500,000 left in their hands last April and that payment of their counsel and others ceased on Feb. 1, at which time the company took over the property. The receivers will be discharged officially when Mr. Wasson's report on the case is approved by the United States District Court.

$1,000,000 Detroit Equipment Trust Issue Includes Buses

Eight heavy interurban passenger cars with motors, 6 interurban passenger chair cars with motors, 15 double-truck, 52-passenger one-man cars with motors, 50 box cars each of 30 tons capacity, 25 29-passenger, single-deck, six-cylinder motor coaches, 10 66-passenger, semi-closed, double-deck, six-cylinder motor coaches and 40 29-passenger, single-deck, four-cylinder motor coaches have been pledged to the Union Trust Company, Cleveland, by the Detroit United Railway as security for an issue of $1,000,000 of general equipment trust 6 per cent certificates, series A. The securities are being offered to the public by Watling, Lerchen & Company, Detroit, and the Union Trust Company, Cleveland, at prices to yield from 5 per cent to 6 per cent, depending upon the maturity. The equipment pledged as security for the loan cost in excess of 133 per cent of the principal amount of the issue.

The equipment certificates are dated Nov. 1, 1924, and are due in equal semi-annual payments in annual amounts of $150,000 for the first five years and $50,000 for the remaining five years. Payment of principal and interest is unconditionally guaranteed by the Detroit United Railway by indorsement on each certificate. The equipment will be leased to the Detroit United Railway at rentals sufficient to provide for the semi-annual installments of both interest and the amount due to amortize the purchase cost.

Service Resumed in Kewanee

After a suspension of more than a year railway service was resumed in Kewanee, Ill., on Nov. 29 by the Kewanee Public Service Company. Cars in Kewanee and on the interurban line between Kewanee and Galva ceased to operate because of a combination of circumstances, prominent among which were jitney competition and the increased use of the private automobile. The property was then under the management of the Galesburg & Kewanee Electric Railway.

The intention was to scrap the line, but in June of this year the citizens of Kewanee, a town of 17,000 inhabitants, voted to accept suggestions made by B. F. Lyons, the new owner, for rehabilitating the property. All Mr. Lyons wanted was assurance that in the future the company would be dealt with fairly by the public.

The action of the voters granted the Kewanee Public Service Company a franchise to operate the electric and gas utilities in Kewanee for a period of twenty-five years. The railway franchise, granted at the same time, extended that grant for a period of twenty years, the longest term obtainable under the Illinois law. As a result of the negotiations conducted at that time the Kewanee Public Service Company was organized to own and operate the electric light and power, gas and street railway business in Kewanee, the gas business in Galva, and do electric light and power business in Sheffield and Neponset. The company, through its subsidiary, the Kewanee & Galva Railway, will also operate a short interurban line connecting Kewanee and Galva. The whole undertaking was financed largely through the sale last July of $1,200,000 of first mortgage 6 per cent gold bonds, Series A of the Kewanee Public Service Company, Kewanee, Ill. The proceeds of this issue was used by the company to take over the properties of the Consolidated Light & Power Company, the municipal plant built by the city of Kewanee and to acquire the street railway and interurban properties.

Status of Denver Viaduct Claims Fixed

The title "$200,000 Verdict Against Denver Tramway," with which an item about the Denver Tramway in the ELECTRIC RAILWAY JOURNAL for Oct. 25 was introduced, was somewhat misleading. The facts are that the city of Denver applied to the lower court for an order to have the monthly payments under the 1906 franchise declared to be in a preferred class. This plea was denied. The city then appealed to the Circuit Court of Appeals. That court held that the payments accruing subsequent to the receivership were in the nature of operating expenses and therefore entitled to preference, while those accruing prior to the appointment of the receiver were entitled to preference only over ordinary creditors but junior to lien holders which had attached. The only question involved in the proceedings was whether these payments were in a preferred class. It was never the contention of the railway that it did not owe the money.

The Sixteenth Street viaduct and the extensions thereto were originally constructed in 1889 and 1910 respectively by predecessor companies of the Denver Tramway at a total cost of $256,231 and deeded to the city under an agreement that the city was perpetually to maintain it. The steam railroads and other interests subsidized the construction of the old viaduct to the extent of $79,897.

It was decided by the city in 1921 to rebuild the viaduct, and in order to insure that the work would be done expeditiously and at the least cost to the city, it was decided to use the facilities of the tramway. An agreement was made with the city to pay on the basis of actual cost for such work as it ordered done by the tramway. The actual cost of the work performed for the city by the company was $67,677 and bills were rendered accordingly.

In addition to the work done for the city, the company expended for its own account $100,033 on track, overhead, paving, etc., and also suffered an increase of $76,444 in operating expenses by reason of the rerouting of service while the viaduct was under construction. No part of these two amounts was included in the bill against the city.

Mortgage Bonds Offered. — Dillon, Read & Company and Tucker, Anthony & Company, New York, are offering at 95 and interest to yield about 5.35 per cent $1,000,000 in first refunding mortgage 5 per cent sinking fund gold bonds of the Manchester Traction, Light & Power Company, Manchester, N. H. The bonds are dated Aug. 1, 1917, and are due Aug. 1, 1952. The company operates railways in Manchester and vicinity.

Auction Sales in New York.—At the public auction rooms of A. H. Muller & Sons there were sold this week $2,000 of Twenty-eight & Twenty-ninth Streets Crosstown Railroad, New York, first mortgage 5 per cent gold bonds due October, 1996; October, 1908, and subsequent coupons attached, $50 lot. Last week at the same offices there were sold 20 shares of West Virginia Traction & Electric Company 7 per cent cumulative preferred, $5 for the lot, and certificates of deposit for 116 shares of Kansas City Railways preferred; certificates for 26 shares Kansas City Railways common, $36 lot; also $12,650 Berwick & Nescopeck Street Railway first mortgage 5 per cent bonds, due 1944, $550 lot.

New Directors for Illinois Properties.—George F. Otis, president of the Central Trust Company of Illinois, Chicago, has been elected a director of the Illinois Power & Light Corporation, and George T. Buckingham, of the law firm of DeFrees, Buckingham & Eaton, Chicago, has been elected a director of the North American Light & Power Company, both of which are included in the group of properties of which the Illinois Traction System is a part.

Stock of Jamaica Company Increased.—Shareholders of the Jamaica Public Service Company, Ltd., Kingston, Jamaica, B. W. I., on Nov. 28 approved a resolution increasing the authorized capital of the company from $1,500,000 to $2,000,000, the increase to take the form of $250,000 in 7 per cent cumulative preference stock B of a par value of $5 per share and $250,000 in shares of ordinary stock of a par value of $50 each. Included in the property of the company are 26 miles of electric railway.

Restoration of Service on Proper Guarantees.—The Worcester Consolidated Street Railway has not entirely abandoned the idea of restoring service from Worcester, Mass., and Leicester and Spencer. Clark V. Wood, president, says that service might be restored if there was any indication of a sufficient demand or any assurances of support from town officials. The Spencer line at one time was one of the principal suburban lines of the company. It was discontinued several months ago when bus competition made it impossible to operate the route to advantage. At that time townspeople expressed preference for buses.

Discontinuance Expected.—The Medway & Dedham Street Railway, which runs through the towns of Medway, Millis, Westwood and Dedham, Mass., planned to suspend operations Dec. 1. The action was decided upon when it became apparent that the accumulating deficits could not be overcome. Last year each town which the road served appropriated $1,000 for assistance. The deficit kept growing, however, and the directors decided not to burden the towns any longer. The line has been in operation for 25 years. It originally ran to Franklin. Failure to show profit resulted in the junking of the Franklin line several years ago. Present plans call for early disposition of the entire property, including the carhouse and power station at Westwood. The road is 18 miles long. It was leased by the Milford & Uxbridge Street Railway for several years. That company gave up control three years ago.

Mortgage Bonds Offered. — Harris, Forbes & Company and Spencer Trask & Company, New York, are offering at 97½ and interest yielding more than 5.15 per cent $1,100,000 of first mortgage gold bonds of the Wisconsin Gas & Electric Company, Kenosha, Wis. The bonds, known as 5 per cent series A, are dated June 1, 1912, and are due June 1, 1952.

Deficit of $628,480.—The total revenue of the Interborough Rapid Transit Company, New York, N. Y., for the four-month period ended Oct. 31, 1924, was $18,422,630. This represented an increase of $465,524 over the similar period a year ago. The operating expenses, taxes and rentals paid the city for the old subway were $12,426,868, a decrease of $426,957 over the similar four months in 1923. The income available for all purposes for the four-month period of 1924 ended Oct. 31 was $5,511,379, an increase of $1,473,183 over a similar period a year ago. The balance after actual maintenance in 1924 was a deficit of $628,480, an increase of $1,168,234 over the four-month period ended Oct. 31, 1923.

Hearings on Abandonment Concluded.—Hearings on the proposed abandonment of the lines of the Pacific Electric Railway in Riverside, Cal., before the State Railroad Commission closed recently. The company provided statements to show that it had been losing money steadily on the local lines. The matter has been referred to before in the ELECTRIC RAILWAY JOURNAL.

Final Judgment in Receivership Case.—The Court of Appeals in Albany has handed down a decision confirming a judgment obtained in June, 1923, by Newton M. Hudson, receiver for the Central Park, North & East River Railroad, against the Forty-second Street, Manhattanville & St. Nicholas Avenue Railway. The amount of the judgment is $51,506. The decision will bring to an end a receivership dating back to 1912, and make it possible for the Central Park Company to pay to its creditors 100 cents on the dollar. The Central Park Company formerly was one of the leased lines operated by the Metropolitan Street Railway. In August, 1908, the United States District Court ordered it turned back to its stockholders, terminating the lease. George W. Linch, at that time receiver for the company, succeeded after a long legal battle, in reducing the claims against the company to $303,000. Finally there remained a claim on the part of the Central Park Company against the Forty-second Street, Manhattanville & St. Nicholas Avenue Railway under an old trackage agreement. This claim was prosecuted and resulted finally in the decision mentioned previously. Mr. Linch died in 1915 and John Beaver was appointed to succeed him. He died in 1917 and Mr. Hudson succeeded him.

Expenses Lower.—The Grand Rapids Railway, Grand Rapids, Mich., recently reported to the city manager that operating expenses were reduced $2,047 in October from the October, 1923, figure. The report shows the company failed by $11,853 to return its allowable 7¾ per cent on its valuation. There was only 1.13 per cent decrease in the passenger revenue and the gross income of $49,632 showed an increase of $2,584 over October, 1923.

$1,250,000 of Preferred Stock Offered.—Offering is being made by Pynchon & Company, West & Company and Jackson & Curtis, New York, of a new issue of $1,250,000 Broad River Power Company 7 per cent cumulative preferred stock. The Broad River Power Company was organized in July, 1924, in South Carolina for the purpose of acquiring the entire outstanding common and preferred stock of the Columbia Railway, Gas & Electric Company, which owns or controls all the outstanding common stock of the Parr Shoals Power Company and Columbia Gas Light Company, Columbia, S. C. In pursuance of this plan the company will now take over substantially all of such preferred and common stock of the Columbia Railway, Gas & Electric Company and of the preferred stock of the Parr Shoals Power Company.

Legal Notes

MISSOURI. — *Passenger Remains Such Until He Has Alighted and Is Entitled to High Degree of Care While Alighting.*

In this case, the conductor on an interurban road was assisting passengers to alight at a stop and after helping a woman down part way, turned to help another, and the first one fell and was injured. The court held that a passenger remains such until he alights and that a very high degree of care is imposed by law on the railway during the time that the passenger is attempting to alight. Since the conductor undertook to aid this passenger, he should have used due care in doing so. (Lackey vs. Missouri & K. I. Railway, 264 Southwest. Rep., 807.)

OKLAHOMA.—*Powers of Public Service Commission—Regulation Does Not Mean Management or Operation by Commission.*

This case was an appeal from a ruling of the State Corporation Commission of Oklahoma that persons who dine in the railroad restaurants of the Santa Fé Railroad must wear coats was unreasonable. The ruling was directed to Fred Harvey, a corporation operating the dining rooms, but the railroad company joined in the appeal. The Oklahoma Supreme Court, in deciding against the commission, laid down certain principles in regard to commission regulation which are of interest. One was that the commission has authority to deal with the servants of a public utility only so far as may be necessary to carry into effect a lawful order against its master or principal, and against such principal should all such orders be entered. A second was that while much power is by law given to the Corporation Commission in the regulation of public utilities, yet the utility is not the property of the commission or the state, but belongs to the company and its stockholders, and the officers and directors by them selected must, under proper regulation, be permitted to manage the property in such proper way as to earn and pay, if they lawfully can, just dividends to the stockholders. Regulation must not be so far extended as to constitute management or operation. A third was that a public utility has the right to prescribe and enforce reasonable rules and regulations for the government and use of its property, and no such rule should be abrogated by the Corporation Commission, unless it is contrary to the law of the state, or is clearly proved to be unjustly and injuriously discriminatory, or is so arbitrary and unreasonable as to be decidedly unjust to its patrons. A rule that is made applicable equally to all and with which all can comply with equal ease is not discriminatory. (Harvey et al. vs. Corporation Commission of Oklahoma, 229 Pacific Rep., 428.)

TEXAS.—*Duty of Railway Company to Warn Employees of Independent Contractor of Danger. Damages Collectible from Both Railway and Employer.*

A causeway which was used by an electric railway and several steam roads was destroyed in part by a storm, and its reconstruction was let to a contractor who agreed to be responsible for injuries developing in the work. An employee of the contractor while operating a derrick was killed by an electric shock when the cable on the derrick came in contact with the overhead trolley wire. The decedent's representatives collected a certain amount from the insurance company protecting the contractor under the workmen's compensation act and an additional amount from the electric railway, it being held that the railway had not sufficiently warned the employee of the contractor of the danger from its uninsulated wires. (Galveston-Houston Elec. Ry. Co. et al. vs. Reinle, 264 Southwest. Rep., 783.)

Personal Items

Stone & Webster Managerial Changes Announced

Walter M. Bird, formerly manager of the Keokuk, Iowa, Electric Company, has been appointed manager of the Paducah, Ky., Electric Company and the Paducah Railway, succeeding Alfred S. Nichols, who is now manager of the Jamaica Public Service Company, Ltd., at Kingston, Jamaica. Philip M. Wentworth, formerly manager of the Fort Madison, Iowa, Electric Company and Dallas City, Ill., Light Company, succeeds Mr. Bird as manager of the Keokuk company, and J. Bertram Hayes, for the past eighteen months assistant to the manager of the Jamaica Public Service Company, Ltd., is the new manager of the Fort Madison and Dallas City companies. All these utilities are under the executive management of Stone & Webster, Inc., Boston, Mass.

A. L. C. Fell an Outstanding British Tramway Figure

The duties of A. L. C. Fell, who will retire as general manager of the London County Council Tramways, London, England, on Dec. 31, will be carried on after that time, temporarily at least, by J. K. Bruce, traffic manager of the system. As explained very briefly in the ELECTRIC RAILWAY JOURNAL for Nov. 8, Mr. Fell is retiring owing to ill health. For 21 years he has occupied the post that he is now about to relinquish.

In a full-page appreciation of Mr. Fell which the *Tramway and Railway World* published in its issue of Nov. 20, that paper explained that during Mr. Fell's tenure of office in London, traffic receipts and the number of passengers went up rapidly for a long time, but that there was a slacking down during the war, followed by great increases of working expenses. Finally came the great development of omnibus competition. This same English authority points out that it is a notable fact that the average speed of the lines under Mr. Fell has been gradually increased until it is now 9½ m.p.h., the highest in Great Britain.

Mr. Fell is by training an electrical engineer. He was responsible for the installation of electric traction on the tramways of Cork. In 1900 he became tramway electrical engineer to Sheffield Corporation and superintended the electrification of the lines there. Thereafter he became general manager, and in 1903 he resigned his position at Sheffield to become general manager of London County Council Tramways.

A. J. Klatte in New Post at Chicago

A. J. Klatte

A. J. Klatte has been appointed assistant electrical engineer of the Chicago Surface Lines. There has been no such title in the Surface Lines organization since 1915, at which time H. M. Wheeler died. The electrical engineer, J. Z. Murphy, has not been in good health for some time past and during his absence the department will be under the supervision of Mr. Klatte.

Mr. Klatte was born at Milwaukee, Wis., on July 1, 1879. He received his preliminary education at Beloit College and was graduated from the school of engineering at the University of Wisconsin in 1905. His first work was as level man and transit man on steam railroads. He has been connected with the Chicago street railway properties since 1908. His first work there was as conduit engineer with the Chicago Union Traction Company. Later he was engineer in charge of conduits and since the Surface Lines was formed in 1914 he has been engineer of electrical distribution.

E. G. Dunlap Vice-President at Youngstown

Elton G. Dunlap was elected vice-president of the Pennsylvania-Ohio Power & Light Company and the Pennsylvania-Ohio Electric Company, Youngstown, Ohio, on Nov. 20 to succeed the late Randall Montgomery. The two companies operate the power and light properties in Youngstown and in New Castle, Pa.; Sharon, Pa., and elsewhere in eastern Ohio and northwestern Pennsylvania and the interurban and city railways and coach lines in the same territory. Mr. Dunlap was born near Youngstown on Oct. 20, 1881. He entered the employ of the railway and electric companies in 1901 in the accounting and treasury department and rose through various grades of accounting and treasury work till he was elected treasurer of the properties in 1910. He has held that office since and continues now as treasurer as well as vice-president.

E. G. Dunlap

Obituary

John Lyell Harper

John Lyell Harper, at one time operating and construction engineer for the Twin City Rapid Transit Company, Minneapolis, Minn., and recently vice-president and chief engineer of the Niagara Falls Power Company, Niagara Falls, died on Nov. 28. Mr. Harper was considered one of the leading hydro-electric engineers in the United States. In 1902 Mr. Harper became associated with the Niagara Falls Hydraulic Power & Manufacturing Company as assistant engineer to the late Wallace C. Johnson. Sixteen years later, when the various power interests at Niagara Falls were grouped into a new corporation, under the name of the Niagara Falls Power Company, Mr. Harper was made chief engineer. Upon completion of the war-time power plant, he was elected vice-president of the corporation. Mr. Harper was graduated from Cornell University. He was fifty-one years old.

J. M. McElroy, formerly general manager of the Manchester Corporation Tramways, Manchester, England, died on Nov. 16 in Lancashire. He retired from the managership in February, 1922, owing to ill health. Mr. McElroy had been in the Manchester municipal service in different capacities since 1880. In 1901 he was appointed manager of the tramway undertaking after it was acquired by the municipality. It was under his auspices that the Manchester system was developed. He visited the continent of Europe and the United States to study tramway matters and during the war was a consultant to the government on transportation questions. Mr. McElroy was an original member of the Municipal Tramways Association and in the position of secretary and later as president he contributed largely to the growth of that body. He was largely responsible for the formation of the National Joint Industrial Council for the tramway industry.

Dr. Charles A. Abbott, who for many years has been an examining physician and surgeon for the International Railway, Buffalo, N. Y., died Dec. 1 after an illness of less than two weeks. He was stricken after testifying in court in a negligence case for the railway company.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Order Placed for Experimental Buses in Detroit

The city of Detroit proposes to rent 25 buses from the Dodge Brothers Motor Company. Action to this end was recommended by the Street Railway Commission following a conference between the members of the commission and John W. Smith, Mayor of Detroit. Bids were asked for the rental of buses to the city for use in conjunction with the municipal railway. The City Council has informally approved the plan.

The commission also recommended the purchase of five buses from each of three firms: The Yellow Coach Manufacturing Company, Chicago; the Standard Motor Truck Company, Detroit, and the Gotsfredson Truck Company, Detroit. The idea is to make a comparative test of the various types of vehicles in actual service.

The commission's recommendation relative to the purchase of 15 double-deck buses, five from each of the two Detroit concerns and five from the Yellow Coach Manufacturing Company, was also approved by the Council in committee. Following a conference with Mayor Smith, it was announced that all were agreed that the city should encourage and support the motor bus industry in Detroit, but that orders should not be placed with local manufacturers on the basis of civic pride alone, particularly if the purchases involved equipment that carried with it the possibility of still further experimental work on the part of the manufacturers.

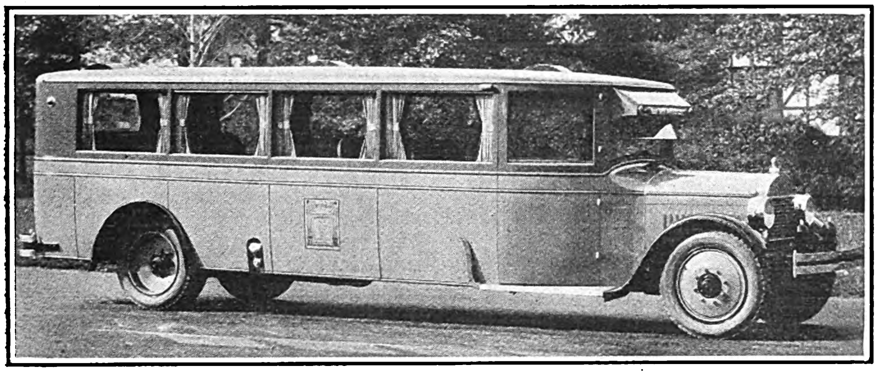
The buses which the commission proposes to rent will provide transportation facilities for stub-end lines in outlying districts during the winter months. Each bus will accommodate 21 passengers, whereas the buses which are to be purchased will carry approximately 60 passengers each.

According to the terms proposed the city will pay a rental of 29 cents per mile. This rental will be applied on the purchase price of the buses at the end of four months if it is decided to purchase them from Dodge Brothers.

Mack Parlor Car Buses on Rochester Run

The Third Avenue Bus Company, a subsidiary of the New York State Railways, Rochester, has recently placed in service two of the latest type of luxurious Mack parlor car buses. These buses are operating on a regular schedule between the downtown section of Rochester and the town of Browncroft. The fare charged is 25 cents.

The bodies were built by the Lang Body Company, Cleveland. They seat 22 passengers in comfortable individual wicker chairs upholstered in genuine leather. Space is provided over the rear wheel for housing passengers' baggage. Wide clear-vision windows, automatically operated by springs, are easily adjustable to any elevation desired.



Mack Bus Intended for De Luxe Suburban Service

The Mack bus chassis on which these bodies are mounted have a wheelbase of 230½ in. They are powered by four-cylinder bus engines of special design. having a 4¼-in. bore and 5-in. stroke. Each is equipped with two independent sets of brakes, one set operating on the rear wheels and the second set on the drive shaft just rearward of the transmission. Patented Mack rubber shock insulators on the spring ends support the unusually low frame.

Big Bus Order Divided

Decision has been made by the Public Service Railway, Newark, N. J., to divide its order for 100 new buses between the Yellow Coach Company and the White Motor Company. This order was mentioned in ELECTRIC RAILWAY JOURNAL, issue of Nov. 15, 1924. Of the new buses 50 will be type Z, 29-passenger Yellows, and 50 will be Whites, type 50-A with Bender bodies. It is expected that deliveries will begin within the next three weeks.

New Tramway System in Argentina

The municipal authorities of the city of Rosario, Argentine Republic, in May, 1924, sanctioned an ordinance calling for public bids for the construction of nearly 150 km. of a new system of electric street railway. This new installation will practically double the length of track now in service. The successful bidder will have 5 years within which to complete the contract, and is obligated to open for public service 25 km. of new lines each year.

In the descriptive matter sent out by the municipality it is specified that the gage of the track shall be 1 m. 435, that the trolley wire shall be of hard-drawn copper or phosphorus bronze at least 8.5 millimeter diameter and that the rails in all paved streets shall be of the type called Phoenix, weighing 45 kilos per lineal meter or of the Vignole type weighing 33 kilo per meter in unpaved streets.

Other things specified have to do with various phases of the technical and financial sides of the contract and the conditions under which they may be operated during the life of the concession.

The bids will be opened in Rosario on April 2, 1925. Requests for the usual data sheets and contract forms should be made to Senor Don Carlos Edwards, pro-secretario, Secretaria de la Intendencia Municipal, Rosario de Santa Fé, Argentina.

Mention was made of this project in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 22, page 900. Details covering the complete specifications may be inspected at the New York offices of this paper.

200 Gas-Electric Buses for Philadelphia

The Philadelphia Rural Transit Company, a subsidiary of the Philadelphia Rapid Transit Company, has placed orders for 200 gas-electric buses after a series of tests. All of the electrical equipment on the first bus and on the 200 now on order is supplied by the General Electric Company for the Yellow Coach Manufacturing Company, Chicago.

These are double-deck buses, seating 64, of the type usually equipped with mechanical drive. The bus on which the first electrical equipment was installed weighs 16,760 lb. completely equipped.

Power is supplied by a six-cylinder Herschell-Spillman engine with a 4-in. bore and 6-in. stroke. The clutch and change gear transmission which are ordinarily used are replaced by a generator, which is direct connected to the engine flywheel through an internal external gear coupling.

Two GE-1079 motors, rated 85 amp. at 125 volts and 1,650 r.p.m., mounted sire by side in the chassis, transmit the power to the rear axle through two propeller shafts, each geared to a rear wheel, eliminating the differential, and providing constant torque on both wheels. These motors are self-ventilated and have a relatively long frame of small diameter permit-

ELECTRIC RAILWAY MATERIAL PRICES—DEC. 2, 1924

Metals—New York

Copper, electrolytic, cents per lb.	14.25
Lead, cents per lb.	8.65

Hardware—Pittsburgh

Wire nails, base per keg	2.85
Sheet iron (28 gage), cents per lb.	3.50
Sheet iron, galvanized (28 gage), cents per lb.	4.60
Galvanized barbed wire, cents per lb.	3.65
Galvanized wire, ordinary, cents per lb.	2.60

Waste—New York

Waste, wool, cents per lb.	16
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–19
Colored	10–15

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), per gal.	$1.08
White lead (100 lb. keg), cents per lb.	12.00
Turpentine (bbl. lots), per gal.	$0.81
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4–6

* These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	16.375
Rubber-covered wire, No. 14, per 1,000 ft.	$6.25
Weatherproof wire base, cents per lb.	17.75

Paving Materials

Paving stone, granite, 4x8x4, f.o.b.	
Chicago, dressed, per sq.yd.	....
Common, per sq.yd.	....
Wood block paving 3½, 16 treatment, N. Y., per sq.yd.	$2.67
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.20
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	2.00
Sand, cu.yd., N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.75
Light copper, cents per lb.	10.00
Heavy brass, cents per lb.	7.375
Zinc, old scrap, cents per lb.	4.125
Yellow brass, cents per lb. (heavy)	6.125
Lead, cents per lb. (heavy)	7.75
Steel car axles, Chicago, net ton	$20.25
Cast iron car wheels, Chicago, gross ton	19.75
Rails (short), Chicago, gross ton	19.25
Rails, (relaying), Chicago, gross ton	26.50
Machine turnings, Chicago, gross ton	11.25

ting assembly under the body without sacrifice of road clearance.

After a series of exhaustive tests the bus using the electric drive was put into regular passenger service in August, 1924, and has been in constant operation since, averaging 150 miles daily.

Rolling Stock

Johnstown Traction Company, Johnstown, Pa., is considering the purchase of a number of light-weight, double-truck, one-man, two-man cars for city service.

Fresno Traction Company, Fresno, Cal., has received two of the new universal type cars; the remaining 10 are en route. They were built by the St. Louis Car Company and cost $13,000 each. The cars are 48 ft. long. Each has a seating capacity of 50 persons. They may be operated by one or two-man crews. They are the first Fresno cars to be equipped with four motors, each of 30 hp. The cars were ordered more than a year ago, but delay in construction was due, it was stated, to difficulty in obtaining the safety door mechanism with which the cars are equipped.

Key System Transit Company, Oakland, Cal., has placed orders for 12 new cars to be shipped within 60 days from the plant of the American Car Company, St. Louis, and will be assembled in the Oakland shops. They will be of steel construction, mahogany interior trim and monitor topped. The weight of each, including body, truck and equipment, will be about 68,000 lb. The cars are of the center-door type and each one will have a seating capacity of 68.

Power Houses, Shops and Buildings

Penn Public Service, Warren, Pa., operating an interurban line between Warren and Jamestown, N. Y., has work under way for a complete remodeling of its terminal at Warren. Under the terms of the new plan the company's general offices will hereafter occupy the entire second floor of the company's three-story building at Liberty Street and Pennsylvania Avenue West.

Detroit, Mich., Department of Street Railways, suffered the loss of $50,000 recently when its power plant "A" was crippled by fire. The damage was confined principally to machinery.

Trade Notes

Magnetic Signal Company, Los Angeles, Cal., announces that Ralph W. Payne has been appointed exclusive Southern representative for the company. His headquarters are in the Metropolitan Bank Building, 613 Fifteenth Street, N. W., Washington, D. C. He is in charge of sales and engineering for the Southern territory. Mr. Payne assumed his duties in Washington on Nov. 15.

Philadelphia Storage Battery Company, Philadelphia, Pa., together with the Roberts Battery Company, its New England distributor of starting, lighting and radio equipment, has moved its Boston office on Nov. 25 to occupy new quarters at No. 1 Brighton Avenue. Much-needed office space, parts and stock department and a good service station equipment will make it possible for the interests of all Philadelphia battery lines to be cared for much more efficiently than at any time in the past. George W. Holden is district representative.

A. C. Holden, formerly sales manager of the household appliance division of the General Railway Signal Company, Rochester, N. Y., has been appointed resident manager of the Pacific Coast territory, with headquarters at San Francisco, Cal. Mr. Holden's connection with the General Railway Signal Company began in 1910. Since then he has made a special study of installation and construction work and, in the capacity of field engineer, he had charge of the company's field office at St. Paul, and later was connected with the Chicago, Montreal, New York and Rochester offices. From June, 1916, to January, 1919, his entire attention was devoted to construction work in the eastern district, special attention being given to the signaling of the subway, tube and elevated construction of the New York Municipal Railway lines in New York and Brooklyn. Mr. Holden was born at Waterloo, Iowa. He was graduated from the electrical engineering department of Iowa State College. His first signal experience began in the summer of 1902, with the Hall Signal Company. During portions of 1904 and 1905 he was employed as laborer by the Taylor Signal Company, as paymaster by the Hall Signal Company and draftsman in the signal department of the Union Pacific.

Hyman-Michaels Company, Chicago, due to expansion in the railway equipment field, has engaged the services of F. W. Glauser, formerly associated with the Mid-Continent Equipment & Machinery Company, St. Louis, to assume the management of the equipment department for the Southern territory. Mr. Glauser has a wide and valued experience in railroad work. He will be located at St. Louis.

New Advertising Literature

General Electric Company, Schenectady, N. Y., has published "Pendant and Bracket Novalux," bulletin No. 43525, which describes and illustrates in 24 pages the different types of Novalux lighting units of the bracket and pendant types.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has just issued a new 40-page publication containing transportation hints. The subjects treated are: One-man operation, multiple-unit operation, articulated and permanently coupled cars, double-deck cars, the trolley bus, the internal combustion engine, schedule speeds, methods of fare collection, safety zones, multiple berthing, routing, the selective stop, queue loading, the traffic problem and the elimination of non-productive mileage. The purpose of the book is to summarize results that have been obtained on various railways throughout the United States, using equipment of various types, and to suggest ways of improving the operation by the use of special equipment and methods. It is well written and is in effect a textbook on the subject of improving city transportation methods.

Time to Tighten Up Toward Wage Increases

THE rising trend of wages in the electric railway field is causing uneasiness. There has been accumulating some doubt as to the fairness of the outcome of arbitrations, and the question is raised whether this method of settling wage disputes is falling down. Another question is whether fares, if further increased to meet higher labor costs, will produce the necessary increase in revenue. These are pertinent, vital questions.

Taking the long view of wage arbitrations, as seen in the data presented on page 992 covering the last five years, there does not seem to be justification for the fear that arbitration proceedings cannot be relied upon to produce on the average a fair decision. In this period practically as many cases have been decided for the companies as for the men. The disturbing thing perhaps is that nearly all arbitrations in the last two years have resulted in increased wages, despite the fact that the general trend of wages in all industry is not upward and that there has been no increase in the general cost of living. One or two recent arbitrations have notably disregarded the basic considerations and have no doubt given impetus to the questioning of the wisdom of submitting wages to arbitration.

However, the JOURNAL is inclined to feel that this five-year view of arbitration awards probably shows the matter up in about its true light, and that this need be discounted only to the extent that expertness on the part of the labor side in presenting its case may have come to have a bearing on the decisions of more recent years. This expertness results from an organized, experienced handling of the case on labor's part, as against the individual, largely inexperienced treatment on the part of the railway.

As to the question of fares, the present average for the street railways of the country is 7.17 cents. This compares with 6.95 cents a year ago, but with 7.24 cents in May, 1921, which was the high mark. In other words, the industry has already had an average fare 0.07 cent higher than that at present, which did bring increased revenue over previous rates. Hence, it is at least practical to say that fares could be increased some from the present level if wages necessitated. How much increase in fares would be productive of increase in revenue is problematical. For the individual companies whose fares are already up to about 10 cents, this question becomes extremely serious. If wages for these companies increase more, and the fare cannot be raised to advantage, then these railways have their backs to the wall, so to speak. They are without relief from fare adjustment and have only two courses open. They must be able to make other operating economies to offset the increased labor costs, or they must successfully withstand higher wage demands.

These situations at present are not numerous, but they do point to the necessity of a very determined resistance against further increases, especially where wages are already on such a level that average earnings are equal to or in excess of those in other industries.

Abandonments Are Not Always Justified

SOME replacements of non-paying trolley lines by bus lines have taken place and figures have been presented to show how economies have been effected and sometimes additional traffic developed by the new service. Such facts are established beyond dispute in many cases. But now and then one familiar with the history of the case may well wonder whether, had the situation been handled differently, the trolley line could not have been made to pay, and perhaps to earn a return even greater than that possible by the new service.

A case may be cited to show the situation as it sometimes exists. An interurban electric line some 30 miles long connected two cities, the smaller of which has about 100,000 inhabitants. The railway was equipped with cars suitable for city service, geared for a maximum speed of only about 30 m.p.h. The power supply was poor. The d.c. power plant was nearly 20 miles away from one end of the line with feeders far too small for economical operation. In fact, the voltage drop was so great that on days of heavy traffic, when extra cars were run to handle the peaks, the cars would scarcely crawl up the steeper hills. The writer has in mind one section of the line where he observed the motorman throw his controller handle all the way around—and the car stood still. Not until an inspector issued orders for one car at a time to start did the car move.

The railway location was alongside the highway, but was separated from it, and the opportunity existed for fairly high speed running. But with stops every few hundred feet, it was not surprising that the cars took nearly three hours to go from terminal to terminal, the schedule speed being barely 12 m.p.h. With all these handicaps the road did a good business in the old days, when there was no other means of travel save a steam road that operated indifferently.

Naturally, when the automobile came, traffic fell off until it was deemed wise to abandon through service, and even to tear up portions of the track. As there was a need for through service, a bus line was started, making a limited schedule of less than two hours from the center of one city to the center of the other. Patronage was attracted at once, and the line has been quite successful.

The disappointing part is that it would have been possible to overcome most of the defects of the old rail service. Purchased power with automatic substations properly located would have provided adequate power for a high-speed service without interruption and delay. Many local stops could have been eliminated and schedules as good as or better than those of the buses maintained. Light-weight, one-man interurban cars would have made possible ample service at much less cost than did the old cars. The new investment necessary would not have been excessive. The old investment in track and line, too, could have been preserved.

The case cited is one where inefficiency and indifference to the public's wants spelled the doom of the old line. It was not the failure of one kind of vehicle and the success of another; it was a failure of the management of the electric line. Such failures are too common, especially on the weaker properties. A bus line run the same way as the trolley line was run would have failed just as dismally.

Before deciding to abandon all service on non-paying rail lines, or to change the kind of system, it might be well to examine the defects of the present system. A correction of the faults in operation and the adoption of modern equipment and modern methods will perhaps save the property and make it profitable.

New Car Proposed to Increase Subway Capacity

MUCH publicity is being given in one of the New York picture newspapers to a method "for increasing the capacity of the subways 100 per cent," according to the announcements. The plan is, briefly, to substitute double-deck cars for the present single-deck cars. While it is easy to publish freehand sketches showing how such cars would look, it is quite another matter to build and operate them with the restrictions imposed by the present structures. The headroom in the older subways is only some 12 ft. 6 in., although it might be possible to drop the track 6 in.

It must be realized that the introduction of double-deck cars would not increase the carrying capacity anything like 100 per cent. In the first place, with the floor dropped as low as possible and clear of the rail, space would have to be provided at the ends for the trucks, wheels and motors. The control and braking equipment also take space, and become a real problem in a low-floor vehicle. As the present station platforms are approximately 3 ft. 6 in. above the rail level, the necessary stairways in the cars up to the upper deck and down to the lower deck would take considerable room. Making allowance for all these points, a double-deck car could scarcely carry more than 50 per cent passenger capacity in excess of the present cars. There is also an element of danger in the stairways.

A better type of double-deck car was proposed by John P. Fox, a New York transit expert, over 20 years ago and described in the Boston *Herald* for Oct. 16, 1903. This was a two-level car, with separate doors for each deck and without stairways other than for emergency. Entrance and exit were to be made by means of two-story station platforms. Such an arrangement would simplify the car design materially, and would double the door space, so that the double-deck cars would load and unload perhaps even more quickly than the ordinary single-deck cars. The headroom needed for such a car would be 14 to 15 ft., or greater than that available in the New York subways. The use of such special cars would be practicable now, were new and independent subways constructed for the purpose.

Even if there were sufficient clearance, there are several drawbacks to the use of such cars as are now proposed. If the station platforms were modified for double-deck cars, the existing single-deck cars could not stop at them. As there are several thousand of the latter type of cars in use, such a modification of the platforms would not be feasible. The routing is so complex, and so many different lines operate over the same tracks, that it is improbable that any important routes could be selected for this proposed type of car.

Another Way of Getting Subway Relief

ONE of the simplest methods of increasing the capacity of New York subways would be to use all tracks for express service. The principal rapid transit lines have four-track trunks through the heart of Manhattan, some of them continuing well out into the other boroughs before they divide into double-track branches. Express service is given on one pair of the tracks and local service on the other pair.

It has been demonstrated on practically all the lines that the local trains carry much smaller loads than the expresses. From the very nature of the service this must be so. The function of the locals is to pick up and distribute passengers who make one or both ends of the journey to local stations, but who combine it with a ride on an express. Even the plan which has been adopted in recent years of extending the local tracks into the suburbs has not served to fill the local cars, for all the riders who can, use the expresses until they are forced to transfer to the locals.

The local stations are patronized less than in proportion to the areas served by them. Where the walk is equal, the express station naturally is chosen. Patrons will sometimes walk past a local station to an express stop to avoid changing cars and the double wait.

Practically every rapid transit line in the city has directly above or below it a surface car line, many of which are not being used to capacity. By using such surface car lines as feeders and distributors for the rapid transit lines all or a large share of the local stations could be eliminated entirely so that the four-track subways could be converted into all-express lines. This would permit the present capacity to be nearly doubled, and without any additional expense whatever. In fact, there should be a saving on the rapid transit lines, as the schedule speed on the present local tracks would be increased materially, raising the car-miles to be obtained from a car-hour. Even some of the double-track elevateds and subways could be made express.

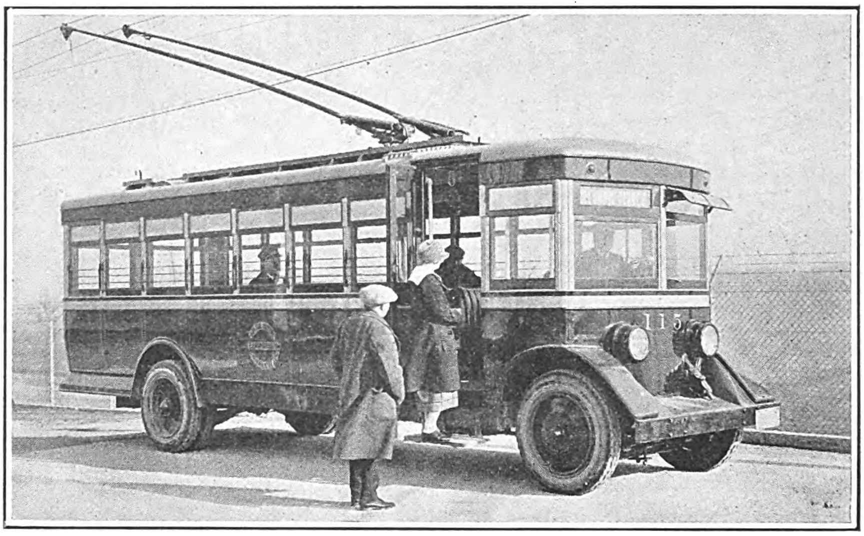
With the present state of chaos in which the surface lines have been thrown through receiverships and disintegration, the working out of such a plan would be beset by great difficulties. Then, too, traffic congestion is today at a point where drastic measures would have to be taken to speed up these surface cars. But with the rapid transit situation as desperate as it has become in New York City, a radical remedy must be resorted to if any kind of relief is to be obtained. Even though a comprehensive program of new construction is adopted, it will be years before the new lines can be made ready for service. Meanwhile anything that will aid in relieving the present intolerable conditions might well be given serious consideration, particularly when it involves no new construction or radical change in equipment or methods of operation.

Trackless Trolleys Give Improved Service to Cohoes, N. Y.

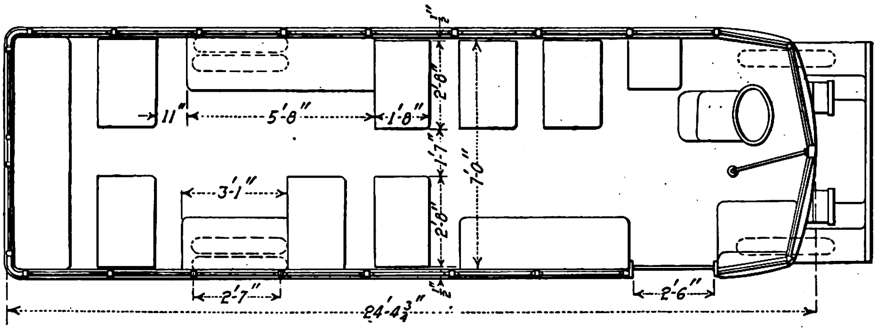
The New Route Passes Through the Main Business Section, Replacing a Railway Belt Line—Residents in a Large Area Now Can Reach the Central Section in 4 Minutes, as Against 15 Minutes Previously

OPERATION of trackless trolleys by the Capital District Transportation Company, a subsidiary of the United Traction Company of Albany, began in Cohoes, N. Y., on Nov. 1, as was announced in the Nov. 8 issue of the ELECTRIC RAILWAY JOURNAL. Four trolley buses are used in the initial service. The routes over which the trackless trolleys are operated and the electric car lines which they replaced are shown on on accompanying map of the district.

Electric car service was previously operated over a belt line which extended north as far as Manor Avenue, south along Columbia Street, west as far as Simmons Avenue and east along Main and North Mohawk Streets. The business section of Cohoes lies along Main and Remsen Streets and residents along the westerly part of the belt line had to follow a roundabout route if they took the electric cars downtown. In fact, residents along a large part of this route could walk across to the business section in less time than by taking the electric cars. The company was anxious to give improved service to this section and believed that this could best be taken care of through a change in route so as to operate west from the business center and give a quick service to the residents along the westerly part of the old belt line. This could be done more economically with the trackless trolley than by building new track.



Receiving Passengers at the Manor Avenue Terminus of the Cohoes Trackless Trolley Line



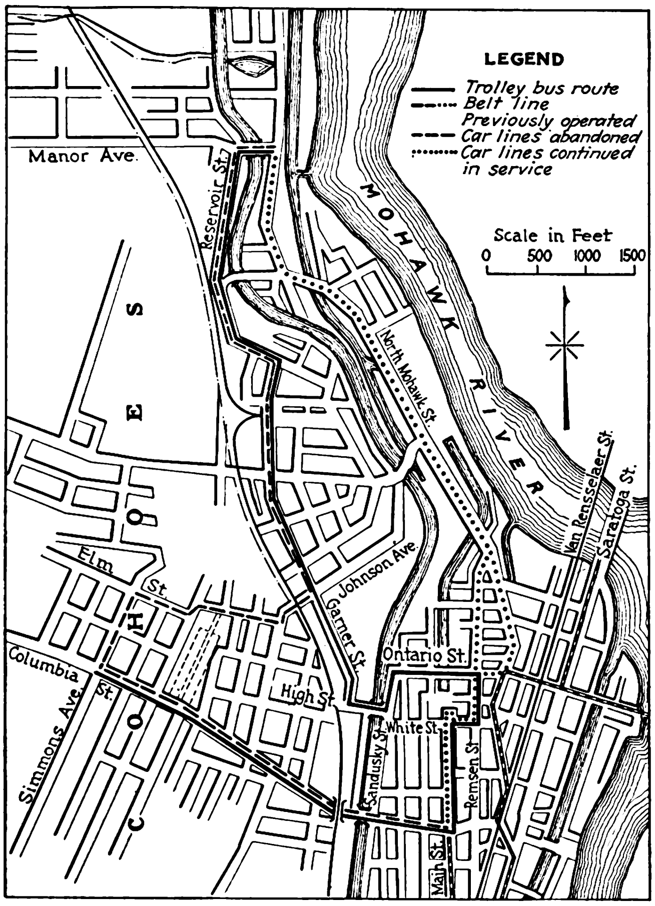
Plan by Which Cohoes Trackless Trolley Seats 31 Passengers

That the company was correct in its diagnosis of the routing is shown by the increased riding which has resulted. On Nov. 3, two days after the trackless trolleys started, they carried 804 passengers. Riding increased steadily and on Nov. 15 1,735 passengers were carried. Transportation figures of passengers carried by the belt line show that Nov. 14 a year ago, which was an average day, 940 passengers were carried. The riding on the new trackless trolley is now well above that of the old belt line, and the steady increase shows that additional vehicles soon will be required.

REASONS FOR DECIDING ON TRACKLESS TROLLEY

The use of trackless trolleys in place of electric cars has enabled the operating company to reduce its track and paving expenses. The city of Cohoes decided to reconstruct and repave streets on a considerable portion of the old belt line route. The revenue obtained from operation of railway service was insufficient for the company to assume this additional cost, but by the use of trackless trolleys this item of expense was eliminated, so that the company is in position to give greatly improved service. The fare charged is 7 cents, the same as on the cars of the United Traction Company. Free transfers are exchanged with connecting car lines.

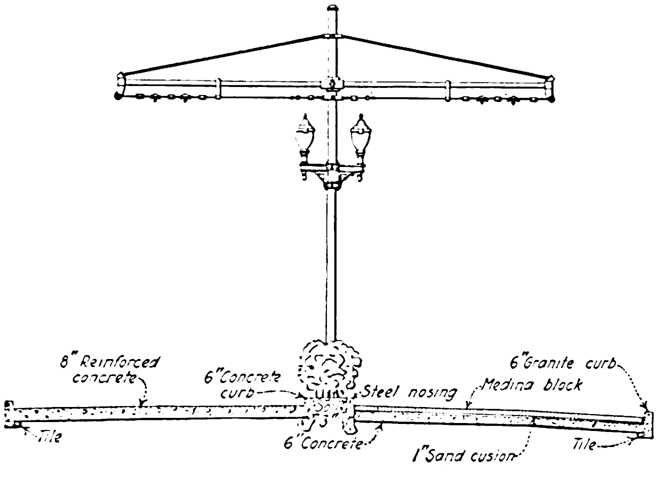
The length of the trackless trolley route from Simmons Avenue on the west to Manor Avenue on the north is 2½ miles. The running time in one direction is 18 minutes, with a 2-minute layover at each terminal. The original belt line mileage was 3.6 for northbound cars and 3.7 for southbound cars. The running time was 30 minutes. The trackless trolleys are thus making a schedule speed of 8.4 m.p.h., as against 7.3 m.p.h. for the belt line cars. More than 40 per cent of the trackless trolley route is over grades of from 5 to 8 per cent. This is another factor in favor of trackless trolley operation as compared with electric cars, since



Route of New Trackless Trolley Line and Belt Line on Which Service Has Been Discontinued

the 8 per cent grade is around a curve and trackless trolleys can negotiate the grade on a larger curve than would be possible with tracks. This is the first trackless trolley route through a business section that has been operated in the United States.

The car tracks along the westerly and southerly part of the old belt line route will be abandoned. Tracks on Columbia Street from Simmons Avenue to the railroad have already been removed and the street has been reconstructed and repaved. The tracks along Main, Remsen and North Mohawk Streets will be retained and electric service operated over these lines. The section along North Mohawk Street as far as Manor Avenue now has cars from Waterford, which previously operated around the downtown loop.



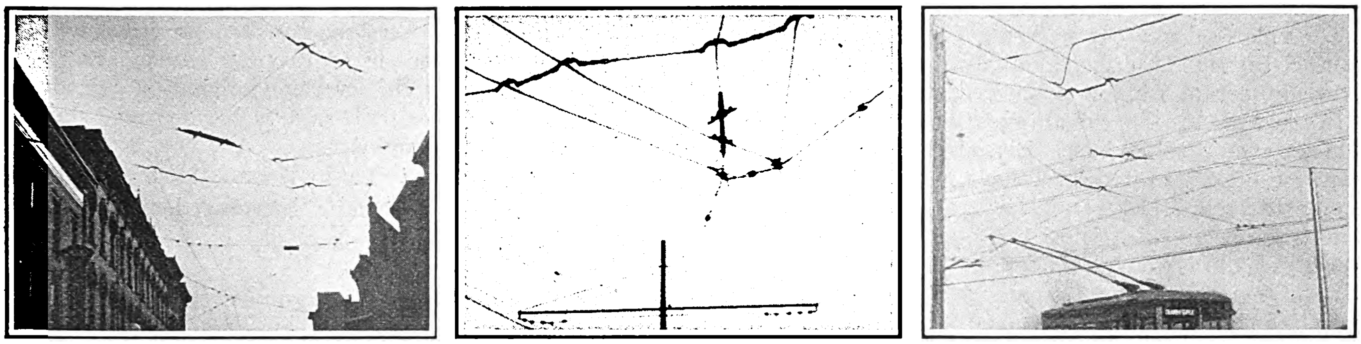
Center Pole Arrangement and Overhead Construction Used on Columbia Street

A considerable part of the route of the trackless trolleys is paved with granite block on a concrete base with cement grout, but brick, concrete, wood block and resurfaced granite block pavements are also found along the route.

The overhead construction for the trackless trolley is entirely independent of that for the railway. Two No. 00 copper trolley wires, spaced 24 in. apart, are suspended by ordinary ears and hangers to $\frac{5}{16}$-in. span wires. The section of the route along Main, White and Remsen Streets also has double-track electric car lines. Here the additional overhead lines for the trolley buses are run at the side of the street and no attempt has been made to use the trolley wire of the car lines. In all cases the negative wires are laid outside, and in order to decrease the drop in potential the two positive wires and two negative wires are tied together about every 1,000 ft. Approximately ½ mile of the entire route is new construction, the other part of the route being over what was previously the belt line track. The poles previously used for the railway are used for the overhead of the trackless trolleys except where the operation is through new territory and along Columbia Street from Simmons Avenue to the railroad, which has been entirely reconstructed and repaved. This part of Columbia Street is 40 ft. wide and the new construction has provided a boulevard arrangement with poles down the center in a reservation 3 ft. wide inclosed by concrete curbs. The city intends to plant flowers and a hedge in this section, so as to beautify the street. The poles also support lighting fixtures, resulting in a decrease in the total number of poles from 11 to 4 in a single 400-ft. block. The sides of the street are thus relieved of pole construction, and a very attractive arrangement has resulted, as is shown in an accompanying illustration. As land was not available for con-

DETAILS OF TRACKLESS TROLLEY BUSES OPERATED IN COHOES, N. Y.

Operating company	Capital District Transportation Company
Number of trackless trolleys operated	4
Chassis	Model J, Brockway Corporation with Clark axles
Wheelbase	197 in.
Tires	General pneumatic cords 36 x 6, dual rears
Front tread	5 ft. 6 in.
Rear tread	5 ft. 11 in.
Turning radius inside wheels	35 ft.
Body manufacturer	Wason Manufacturing Company
Length over all	26 ft. $1\frac{1}{8}$ in.
Heignt, pavement to top of roof	9 ft. $\frac{1}{2}$ in.
Height inside	6 ft. $6\frac{1}{16}$ in.
Floor height above pavement	2 ft. $4\frac{1}{2}$ in.
First step above pavement	15 in.
Second step height	13 in.
Width inside	7 ft.
Weight, total	12,500 lb.
Seating capacity	31
Seats	Hale-Kilburn 208 de luxe
Seating material	Spanish leather
Interior trim	Mahogany
Headlining	Haskelite
Sides	Plymetl
Roof	Canvas
Window sash	Wood lined with brass, arranged to be raised
Window guards	Stationary
Ventilators	Nichols-Lintern
Car trimmings	Brass
Signal system	Faraday
Curtains	None
Destination signs	Hunter, roller
Doors and steps	Folding, hand operated
Heaters (with thermostatic control)	Consolidated
Headlights	Ohio Brass
Lamps, interior	12 frosted, 36-watt
Lamp sockets	Lock type
Fare registers	Ohmer
Grab handles and rails	Porcelain
Hand straps	Sanitary
Gong	Consolidated, electric
Trolley equipment	Nuttall
Trolley catchers	Earll
Operator's curtain	Company's standard draw type
Motors	2 GE-264
Control	GE C-154-B
Painting	Red body, cream trimmings, buff roof



Overhead Construction Used with Trackless Trolleys. At Left, on Remsen Street, Where Trolley Buses Parallel Existing Electric Line. Center, Y Construction at Columbia Street Terminal. At Right, Overhead at Manor Avenue Terminal

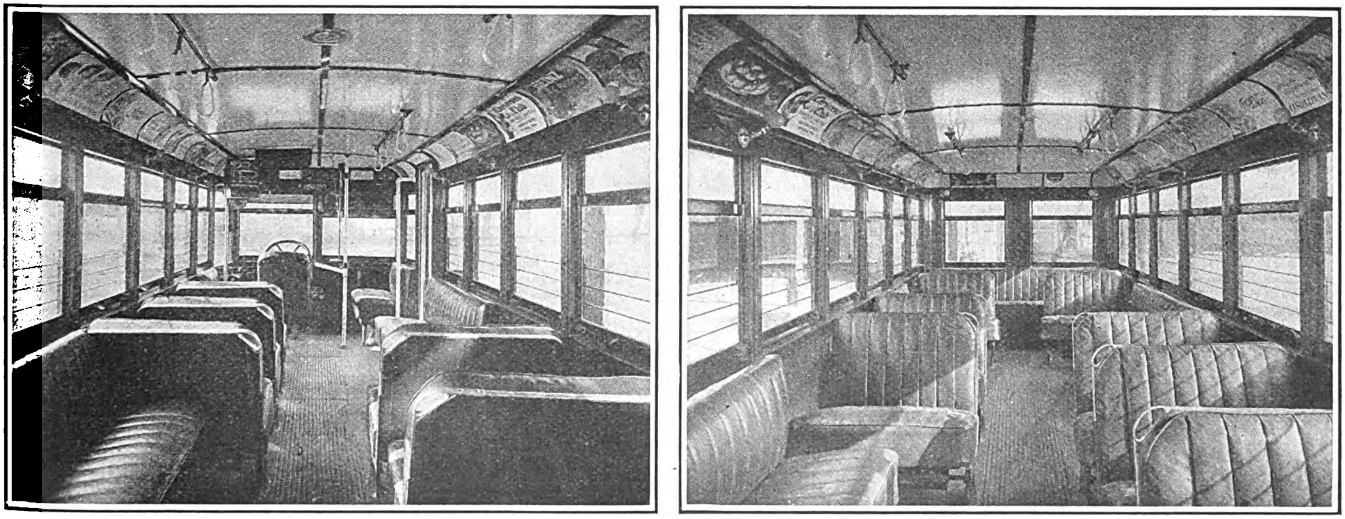
structing loops at the ends of the line a Y construction is used for reversing the vehicles.

In the design of the vehicles themselves, particular attention has been given to attractiveness and comfort. The bodies were built by the Wason Manufacturing Company, Springfield, Mass., and are mounted on Brockway chassis. The important details of construction and equipment are given in the accompanying table.

The over-all length of 26 ft. 1½ in. is the same as that of a standard 29-passenger gasoline bus. By extending the front part of the body, so as to utilize the space taken by the hood of a gasoline bus, a seating capacity of 31 has been obtained. An accompanying illustration shows the seating plan. Seats are comfortable, being of the de luxe type upholstered in Spanish leather. The longitudinal seat at the front end provides additional space for entrance and exit and is also convenient for standing passengers. The two longitudinal seats in the rear part of the body were necessary in order to utilize advantageously the space over the wheel housings. A clear height of 6 ft. 6$\frac{1}{16}$ in. inside is a convenience for standing passengers. Porcelain hand rails with sanitary hand straps are provided. The folding entrance doors provide a clear passageway of 2 ft. 6 in. Window posts are spaced 2 ft. 7 in. between centers, which gives eight large windows on the entrance side. Stationary window guards are installed, as the windows are arranged to be raised. The upper sash are stationary and glazed with white opaque glass. Interior illumination at night is provided by ten 36-watt lamps which have frosted globes and locking receptacles. The two rear lamps are located in front of openings in the rear wall fitted with colored lenses so as to serve as marker lights. While the lamps are along the side of the car over the windows, the type of fixture used brings them out for a distance of approximately 12 in.

The wiring for the signal system also runs in the same section with the light wiring. A push button is located over the center of each window. This location simplifies the wiring considerably, as splices are not needed at each window post, as would be necessary if the signal buttons were installed on the window posts. Electric heaters, equipped with thermostatic control, provide a comfortable interior temperature at all times. An emergency door in the rear right-hand side swings outward together with the window which occupies the panel. The latch for releasing the door is installed in a glass case within the body, so that it must be broken to open the door.

The power for propulsion is provided by two tandem-connected General Electric type 264 motors, which have a rating of 25 hp. each. The control equipment is General Electric type C-154-B contactor type. The operating company is now conducting tests of a control equipment with automatic acceleration and also of regenerative braking for this type of vehicle. The present motor control equipment is actuated by the left-hand pedal, while the right-hand pedal is for braking. A signal lamp of the Consolidated Car Heating Company's type is connected in the control circuit so as to show when the full series position of the control has been reached. Each bus is also equipped with a Consolidated electric gong, which is controlled by a push botton.



Comfortable Interior Attracts Riders to the Trolley Bus. At Left, Looking Toward Operating End. At Right, From Operating End

The color scheme for painting is the standard used by the United Traction Company and consists of a red body, cream window posts and a buff roof.

In regard to the advantages of trackless trolley vehicles over gasoline buses, Ernest M. Murphy, general manager of the United Traction Company, stated that due to the many curves and severe grades which this line contains and provision for rapid acceleration, the power demand is heavy. The motor equipment provided has a higher rating and a greater overload capacity than is ordinarily furnished for the corresponding gasoline-driven bus. There is also an advantage in that the motors used are of a type standard on some of the electric cars of the United Traction Company.

The trackless trolley vehicles have a low center of gravity, which permits an increased height, and thus gives increased comfort to standing passengers. The body has also been extended the full length of the chassis, so as to provide an increased number of seats with greater comfort to seated passengers. The present maintenance forces are familiar with the inspection and repair of electric car equipment and so the addition of the trackless trolleys required no addition to the company's maintenance forces. As power is supplied by a central station instead of from individual engines, as is necessary with gasoline-driven units, the trackless trolleys are cheaper to operate and to maintain. In addition, they are in the shop a considerably smaller portion of the time. There are many other conveniences, such as better lighting and heating, and convenience for control of the various operating devices that present a much simpler arrangement on the trackless trolley.

Determining the Average Length of Ride*

Method Proposed in Connection with Mail Pay Reduces the Number of Observers Needed to Take Field Data—Load Factor Can Be Quickly Determined

IN THE brief submitted by the railway mail pay committee of the American Electric Railway Association, which was presented in the railway mail pay case before the post office department at Washington, a new method of determining the average length of ride on urban railways was proposed. The plan was the work of W. H. Maltbie, special counsel of the United Railways & Electric Company, Baltimore, Md., as attorney for the railway mail pay committee.

Comparatively few accurate determinations of load factor have been made in the past for member companies, so that the amount of evidence which could be presented to the Interstate Commerce Commission as to direct determinations of load factor was relatively limited. A number of other companies, however, have made direct studies as to the average length of ride, and it was possible by a consideration of the configuration and area of American cities, supplemented by the experience of specialists who have worked in traffic surveys, to reach a maximum figure for the average length of ride for the average municipal area. Moreover, the figures furnished by the member companies in the mail pay study made it possible to determine the average seating capacity of the cars used by member companies; while the average number of revenue passengers per car-mile, representing the average number of persons who board each car per mile, is a well-known and daily constant figure for the industry.

These figures are connected by the relation:

$$\frac{\text{Revenue passengers per car-mile} \times \text{Average length of ride}}{\text{Average seating capacity of car}} = \text{Load factor}$$

This formula was used in the argument on the mail pay case.

It is evident at once, however, that the product of the average number of revenue passengers per car-mile by the average length of the ride is the average number of riders upon the car. This fact suggests at once a new method of determining the average length of ride and the load factor for the entire system, for any definite portion of the system, for any day of the week, for any definite hour of the day or even for a single trip.

This new method is extremely simple. It consists merely in placing a single observer on each car on a given line, in a position from which he can command a view of the interior of the car, and directing him to count the number of passengers actually on board the car at definite intervals on the system, that is, for each mile, half mile, or quarter mile. The sum total of his observations divided by the number of counts yields the average number of passengers riding upon the car. This number divided by the seating capacity of the car furnishes the load factor, or divided by the number of revenue passengers per car-mile gives the average length of ride upon that certain line.

The simplicity of this method and its relative inexpensiveness are evident when it is contrasted with the methods formerly in use. The original method, using an origin-to-destination check, involves not only a tremendous amount of clerical work, but also the full co-operation of the riding public. A later method, using on-and-off studies, involves two men upon each car studied and a large amount of clerical work in the determination of the total passenger-miles.

The new method involves only one man upon each car studied and no computation other than the addition of his counts and the division of the total by the number of counts made.

Striped Dasher of Little Advantage

THE method of painting car dashers with stripes to make the car appear wider as practiced at Schenectady, N.Y., and described in ELECTRIC RAILWAY JOURNAL for Nov. 1, page 760, has not given as good results as were anticipated. After keeping statistics of accidents for three or four months the practice was discontinued. Since that time there has been a steady reduction in the number of accidents and also in their cost, although there has been an increase in number of automobiles over two years ago, amounting to nearly 70 per cent. The improved accident record, however, may have come from the added experience of the newer automobile drivers as the summer season advanced.

The Berlin Street Railway is erecting apartment houses near its shops and depots for the housing of its personnel. On Oct. 17 one apartment block, containing 272 apartments, was officially opened. Altogether about 1,000 such apartments will be provided.

---

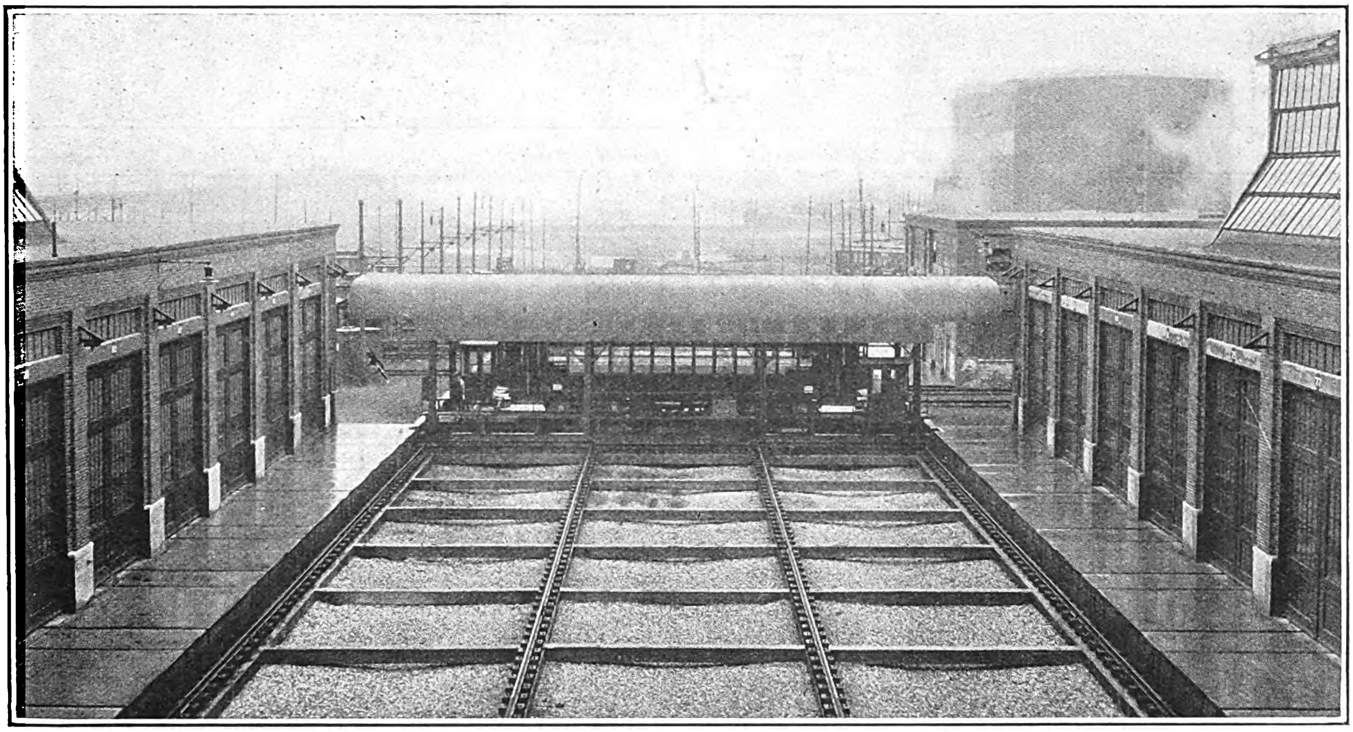
New Boston "L" Lumber Storage and Kiln

Second Article

The Lumber Storage Building, Outside Lumber Storage and Dry Kiln for the New Everett Shops, Boston, Illustrate Advanced Design and Practice—For Efficient Handling of Materials Improved Equipment Is Used



The Transferway Constitutes the Main Axis for the New Boston Shop—The Paint Shop Is on the Left and the Kiln Building and Wood Mill on the Right

IN THE present article on the new Everett car repair shops of the Boston Elevated Railway the improved facilities for handling and treating lumber are described. An outline of the reasons for the construction of the new shops, with a description of the boiler plant, heating installation and power supply, was published in the ELECTRIC RAILWAY JOURNAL for Nov. 22, page 871.

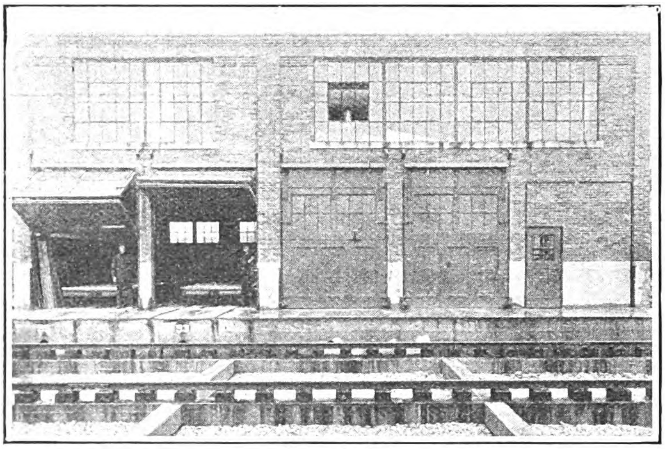
The main axis of the shops is a transferway 80 ft. wide, extending from the southerly end of the yard northerly to the site of the future wheel and axle shop. This may be seen by reference to the general plan on page 872 of the Nov. 22 article. On the west side of the transferway are already built the wood shop, dry kiln and lumber storage building, and in the upper southwest corner of the property is a section of the yard devoted to the outdoor storage of lumber. The lumber storage building and dry kiln building are each 80 ft. square, and are located between the wood mill and the lumber yard. Each is two stories high and the wood mill, about 364 x 158 ft., is one story in height with the exception of a balcony on the west side used as a carpenter shop.

THE HOT-BLAST DRY KILN HAS TWO TRACKS

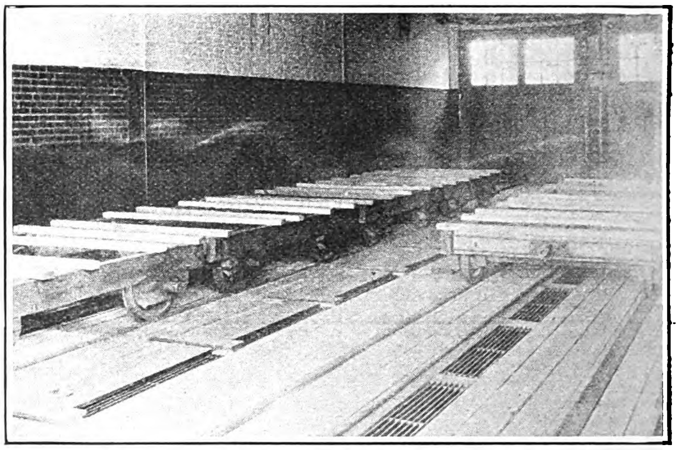
The kiln building, also containing storage space, contains a modern two-track Sturtevant hot-blast lumber kiln with humidity feature, fully equipped, and has bi-folding doors of the jack-knife type set flush with steel-frame openings. Half the first floor is used in kiln work and has two tracks which extend from end to end and thence to the transferway. The remainder of the first story is used for heavy metal storage and the second floor for the storage of light parts and miscellaneous equipment. Details of the ducts for the heated air are shown in the accompanying line drawing.

The first floor of the lumber storage building is utilized for the storage of heavy lumber under cover, the second floor being employed in the storage of lumber under heat. In the northwest corner is a baling room for sawdust and shavings which are piped over from the millroom.

Most of the lumber used at the Everett shops arrives by the steam railroad connections on the west side of the property and is unloaded by hand from cars on spur tracks serving the yard on the west side of the transferway and south of the kiln building. The yard will hold about 350,000 ft. of lumber, or 7 months supply. From this yard a passageway about 15 ft. wide runs between the kiln and lumber storage buildings, terminating at the wood mill, and three tracks laid at right angles to the transferway axis facilitate shifting of cars along the sides of the kiln and storage buildings and parallel to the millroom doors. The lumber is piled as needed on four-wheeled hand trucks carrying



Exterior of Dry Kiln with Entrance to Provide Service from the Transferway



Interior of Dry Lumber Kiln Showing the Trucks, Gratings and Ventilating Arrangement

about 1,000 board-feet each for convenient distribution about the millroom or lumber storage building. For kiln drying it is stacked on special kiln cars or is moved on flat cars by the aid of the transfer table and a service car to any desired point served by the yard and building trackage. If desired, motor truck loads of lumber can easily be delivered into this group of buildings. It is also readily possible to unload lumber directly from the flat cars into the storage building by shifting them through the yard to the transferway and thence to the appropriate track paralleling the side doors of the building.

The kiln proper consists of a single heating compartment containing two parallel tracks, each capable of accommodating two special flat cars and giving a total capacity of 24,000 board-feet of lumber for simultaneous treatment. The kiln proper is about 50 ft. long by 21 ft. wide. The rails are laid to standard gage on reinforced concrete beams, and a 3-in. plank flooring is provided with the wearing surface flush with the rail top. Under each track between the rails a row of ducts supplies hot air to the charges of lumber. The return ducts are in the floor outside of the kiln tracks, with a single large return duct running through the center of the kiln. These ducts are covered with gratings assembled from iron bars of ¼-in. x 1¼-in. section, spaced 1 in. apart. In general these cover louvered openings 4 ft. long by 12 in. wide below the floor level and average 9 in. wide at the outlet. Forty-five gratings are provided for the complete kiln, of which 27 are used as returns to the duct system. The louvers are operated by a stick from the floor.

CIRCULATING THE HOT AIR

Heated air for kiln service is supplied by a 5-hp. motor-driven fan mounted in the basement of the kiln building and arranged to draw air through a chamber containing steam coils before it enters the supply ducts. This heating chamber, a sheet-iron box adjoining the fan housing, is also equipped with a steam

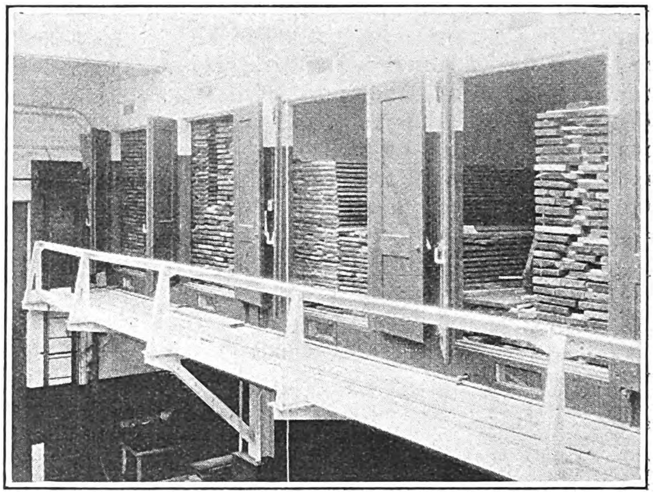
Plan of Kiln Building with Sections of Duct Construction inlet by which the degree of humidity in the entering air can be controlled. The kiln room proper contains two lines of 1½-in. pipe laid between the rails and having a large number of ¼-in. outlets for the discharge of live steam directly into the kiln. The return ducts extend the entire length of the two sides of the kiln and under its center, the three being merged together at the west end and carried back to the fan room for reheating of the air. The ducts thus provide a continuous recirculation of air from the supply ducts up into the center of each load of lumber and outward through the return ducts to the rear of the heating unit. The maximum steam pressure required is 10 lb.

The fan is designed to supply five changes of air per minute through the lumber pile at approximately 1 in. static pressure. The kiln will maintain temperatures up to 150 deg. F. Thermostatic controls of temperature and humidity are installed on the wall of the kiln room and also in the fan room. A Powers regulating valve controls the steam supplied to the coils in the heating chamber, and the installation includes a recording psychrometer (registering continuous wet and dry bulb temperatures) with tubing directly connected to a point in the supply duct system where the maximum drying conditions prevail in the kiln; indicating hygrometers and testing instruments to determine the moisture content of the lumber. A 660-watt, 110-volt electric oven supplied by E. H. Sargent & Company, Chicago, is provided to test the moisture content of lumber samples. The kiln-drying system was furnished by the B. F. Sturtevant Company, Boston, and the recording instruments by the Foxboro Company.

LUMBER STACKED TO GIVE FREE AIR CIRCULATION

Lumber to be kiln-dried is stacked on special trucks, with air spaces between the boards, and is hauled by a service car to the transferway. The spacers are 1½ x 1⅜ in. cross-section. From the transfer table the lumber trucks are pushed into the kiln. The kiln treatment varies somewhat according to the kind of lumber in hand and its condition. Whitewood of all sizes is first live-steamed for four hours at about 10 lb. per square inch, in order to saturate the fibers thoroughly. The stock is then soaking wet to the heart of the wood. Steam is shut off and the blower started, a small amount of steam being let into the hot-air chamber of the air-duct system as air is admitted. The supply of hot air is continued for 5 to 6 days, the lumber being inspected daily to see if the sap is coming off at the proper rate and if the drying is proceeding normally. Should the temperature run too high the lumber tends to curl and if the heating is allowed to continue at an excessive rate warping and honeycombing may follow. The automatic control is valuable in preventing fluctuations of temperature and humidity after the proper values have been determined. On the last day in drying whitewood the moisture is cut off and the work finished with hot air alone. Mahogany is given about the same treatment as whitewood. The same is true of oak, except that in handling green wet-sawed stock it is steam-heated at 100 to 120 deg., followed by 6 to 8 days of kiln drying up to a maximum of 140 deg. Three-inch maple is steamed from 3 to 5 hours at 100 to 120 deg., followed by 10 to 12 days of kiln drying at 140 to 150 deg. Eight days drying generally suffices for 1-in. and 1½-in. maple. About 24,000 ft. of lumber was kiln-dried here in a recent 3-weeks period.

The lumber storage building is equipped with six dry rooms on the second floor, each having double-sheathed wooden partitions and doors; and heated by coils supported on the floor over which the lumber is piled. The central portion of the building is open and skylighted to provide for convenient handling of lumber to and from the lower floor. The lumber is either transported to the south door of the storage building on a kiln car or brought in on a hand truck. The compartments on the second floor are capable of holding 17,000 ft. of lumber each, packed 9 ft. high, and are each 16 ft. square inside. One is utilized in the hot storage of soft pine of 1½-in. size, the next for hot storage of 1-in. pine and the next for dry storage of mahogany and 1-in. whitewood. The bins on the opposite side are assigned to the dry storage of 1½-in. whitewood, oak, ash and cherry. The kiln-drying process is used on sizes of pine above 1½ in. thick, the smaller sizes being hot-dried in the storage house for about 2 weeks at temperatures of from 100 to 150 deg.



The Dry Lumber Storage Has Six Rooms, Each 16 Ft. Square, and Heated by Steam Coils

Air-dried stock is stored under the second floor compartments. These are provided with balconies 3 ft. wide reached by short ladders at the end of the building. They are electrically lighted and equipped with automatic sprinklers and ventilating openings near the top and bottom of the doors.

To facilitate handling lumber from the first floor to the bins above, a detachable wooden roller 4 ft. long and of 4 in. diameter is placed in sockets in front of the required bin at the walkway edge, this taking a considerable portion of the weight of the board from the handlers on the floor and balcony. On the ground floor another convenience in holding boards on the diagonal when passing them up or down is a metal pin inserted in a portable stanchion about 4 ft. high, the handler allowing the board to rest in part against this pin when pausing in the work. In general the steam valves controlling the heating coils in the storage compartments are near the second floor level and close to the doorways.

The kiln building cost $9.51 per square foot of floor space, including equipment, and the lumber storage building cost $7.89 per square foot.

The lumber storage building is connected with the wood mill by a bridge which provides access to the sawdust and shavings separating hopper above the baling room and helps support the dust discharge piping and a steam line feeding the hot storage compartment coils.

English Locomotives for Montreal

FOUR locomotives for use on the new electrified harbor railway at Montreal will be delivered in the near future. They are equipped for operation at 2,400 volts d.c. and have been built by the English Electric Company, Ltd., at a total cost of $478,650. The total weight on the drivers is 200,000 lb. Each locomotive will have a nominal 1-hour tractive effort of 40,000 lb. at a speed of 15 m.p.h. and a maximum tractive effort of 60,000 lb. for 5 minutes.

The locomotives are of the box-cab, double-truck, articulated running-gear type and are provided with twin-gear drive. All the weight is carried on the four driving axles. Each truck is side-equalized and one truck is cross-equalized. Total length inside the knuckles is 39 ft. The diameter of the driving wheels is 50 in.

The cab is divided into three compartments, the central of which contains the control gear and auxiliary machinery. On one end the driving compartment is wider than the main body of the locomotive and has windows in the rear so that a better view of the track can be obtained during shunting operations. This wider compartment is equipped with two driving positions, one facing the front and the other facing the rear. The interior of the cab is lined with heat-insulating material to prevent condensation which might occur on account of temperature changes.

Current collection is accomplished by two pantographs. Control is of the camshaft type. Two Dick-Kerr motors are mounted on each truck.

Arbitrations Have Favored Neither Party

A FIVE-YEAR view of the results of arbitrations of wage disputes between electric railways and their employees shows that one side has won about as often as the other. The results of a study made by the JOURNAL are summarized and detailed in the accompanying two tables. Of a total of 82 cases during the years 1920–1924, the boards of arbitration found for the men in 42, while in 37 cases they found for the company. In 1920, practically all decisions were for the men. In 1921 and 1922 practically all were for the companies. In 1923 and 1924, the tables reversed again, as practically all decisions favored the men.

SUMMARY OF ARBITRATION RESULTS

	Number of Arbitrations	Won by Men	Won by Company
1920	21	19	2
1921	24	2	22
1922	12	1	11
1923	11	11	0
1924	14	12	2
Totals	82	42	37

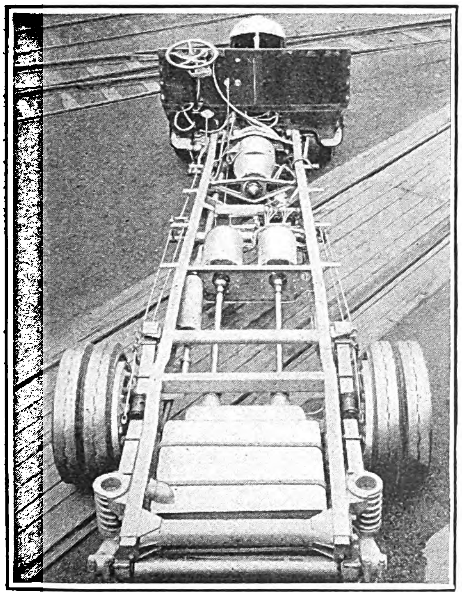
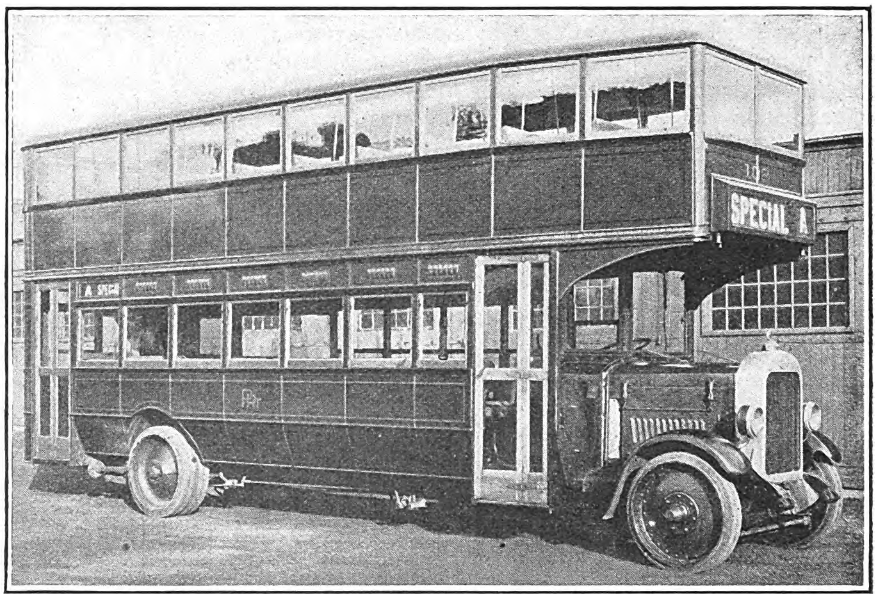
P. R. T. to Operate 225 Gas-Electric Buses

New Design Departs Materially from Previous Gas-Electric Drives — Entire Control Is by Throttle of Gasoline Engine Which Drives Generator—Motors Are Permanently Connected Direct to the Generator and Power Is Transmitted to Wheels by Bevel Gears—Elimination of Differential Is Expected to Lower Maintenance Costs





At Left, Chassis of Experimental Gas-Electric Bus, Showing Power Plant and Individual Motor Drive for Each Rear Wheel Eliminating Differential. At Right, the Gas-Electric Bus Is in General Appearance Similar to the Standard Yellow Coach Gasoline Bus

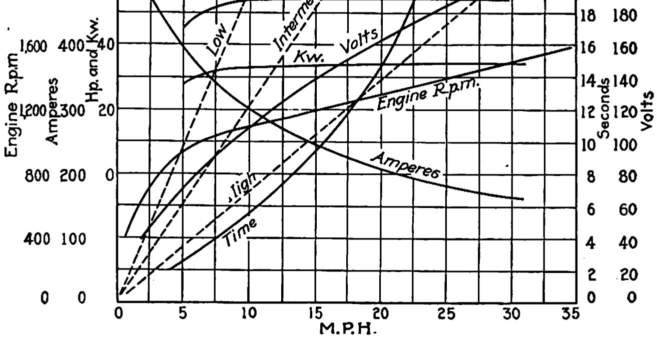
AFTER a series of exhaustive tests, the Philadelphia Rural Transit Company, a subsidiary of the Philadelphia Rapid Transit Company, has ordered 225 gas-electric buses which will differ in several important respects from earlier designs. The placing of the order was mentioned briefly in this paper, issue of Dec. 6. Engines, chassis, and bodies will be built by the Yellow Coach Manufacturing Company, while the electrical equipment will be supplied by the General Electric Company. Mitten Management has ordered 25 additional buses for use in Buffalo. The total cost will be about $3,000,000.

Power will be supplied by a standard six-cylinder engine of 4¼-in. bore and 5½-in. stroke, rated at 108 hp. at 2,200 r.p.m. This engine will drive a generator permanently connected electrically to two 20-hp. electric motors mounted side by side on the chassis frame. These in turn will be mechanically connected to the rear wheels by drive shafts and bevel gears.

The speed of the bus will be controlled by movement of the throttle of the gasoline engine. Clutch, transmission, and mechanical differential have been eliminated. Because of that and also because of the constant torque of the electric motors, the wear and tear on all moving parts, as well as the chassis and body, is expected to be much reduced, insuring a greater length of life for all equipment.

The generator, known as the GE-1098, is compound wound with a differential series field, the shunt winding being excited by a small generator which forms a part of the main generating unit. The exciter obtains its field current from a 12-volt storage battery. This arrangement of windings provides high current and low voltage at starting. Due to the inherent characteristics of the generator, as the vehicle accelerates the voltage increases and the current decreases automatically until normal running speed is reached. For a given throttle opening the output of the generator is substantially constant under all road conditions. In this manner the necessary torque for acceleration or hill climbing is provided without overloading the engine, and with a smooth change of speed. The generator is designed to transmit the output of the gas engine within practical limits of operation. The bus is designed for a normal maximum speed of 26 m.p.h. on a level roadway.

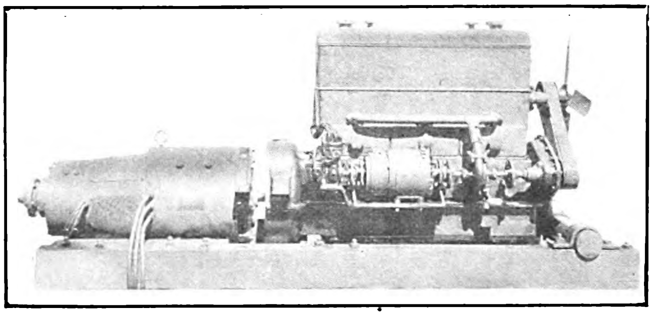
Both the generator and the motors, which are known as GE-1079, are designed on the basis of 125-volt operation, and are self-ventilated. The motor frames are long and of small diameter, permitting assembly on the chassis without sacrifice of road clearance.



Acceleration Curves of the Philadelphia Gas-Electric Bus. The Corresponding Speed Curves for the Gas-Mechanical Bus Are Given in Dotted Lines

Acceleration and all speed changes are obtained solely by variation of the engine throttle, which is controlled by the usual accelerator pedal. As the engine speed increases, the generator voltage rises. The operator need not remove his hands from the steering wheel except to apply the emergency brake. There is no electrical controller for the motors, nor are any electrical adjustments made by the driver when running the bus. A small switch is provided having an off position and reverse for backing. This is connected with a single hand lever to the left of the steering post.

Before this design was definitely selected, competitive tests were run with the experimental gas-electric bus and a bus having the usual gear drive, with clutch, transmission and differential. The accompanying illustrations show the chassis and exterior appearance of this experimental bus. Several minor changes in design will be made when the new buses are built. The gas-electric bus has been in regular service from Aug. 1 up to the present time and has covered more than 13,000 miles.



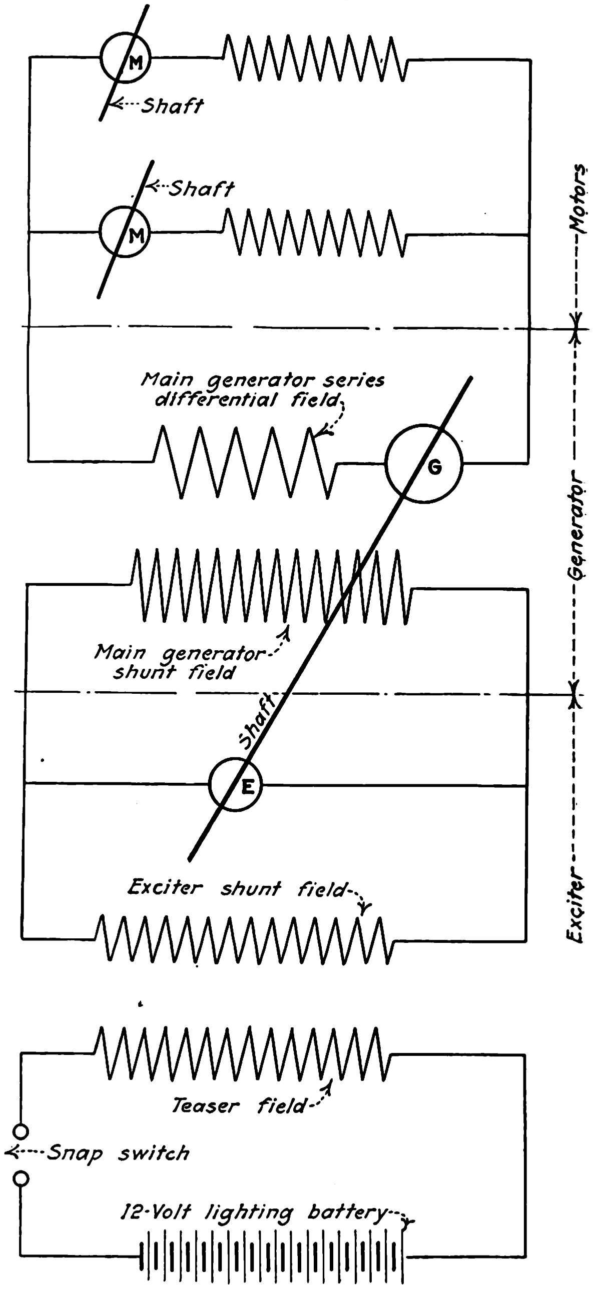
Power Plant of the Gas-Electric Bus Includes a Variable Voltage Generator and a Separate Exciter Driven from the Engine Shaft

It is said that the tests made show somewhat lower fuel consumption for the gas-electric bus for a given service, and at the same time a higher rate of acceleration and schedule speeds. These are important factors in city bus operation. An important point which was developed was the fact that the engine of the gas-electric bus actually makes 20 per cent fewer revolutions when running under city conditions than does the engine of the bus equipped with mechanical drive. This is because with gas-electric transmission it is impossible for the driver to race the engine, and it is also difficult for him to stall it.

The great advantage claimed for the new design, however, is its simplicity. There is comparatively little electric wiring and no controller. The various parts are easily got at for inspection and repair. Elimination of more than 2,000 movements of the gear shift per bus per day is expected to reduce maintenance costs and prolong the life of the chassis and body. Moreover, the electric drive is silent and the customary noise and jerk of changing gears at the time of starting will be absent.

The two-motor drive permits a better distribution of power to the rear wheels when going around a curve. In the event of the failure of one motor, the bus can be brought back to the garage on the one remaining motor. The fact that the bus cannot be put in gear when going down hill is not considered a drawback because there are no steep grades on the routes where the buses will be operated.

The buses are of the double-deck type and have a seating capacity of 66. The weight of the completely equipped gas electric bus will probably be several hundred pounds greater than that of a mechanical drive bus, but exact figures are not yet available. The first of the buses will be operated on the Broad Street route for which a franchise was recently obtained. Additional routes, however, have been planned.



Schematic Wiring Diagram, Showing How Motors Are Permanently Connected to the Generator

Purchasing Agents Aid Traffic Survey

AT A TIME when the time-table division of the Department of Street Railways, City of Detroit, was having trouble to keep pace with lay-offs at the factories, it occurred to the management to seek the aid of the purchasing agent. It was thought that as a member of the Purchasing Agents' Association of Detroit, the latter could readily get in touch with some 500 fellow agents in local manufacturing plants. This was in fact accomplished through the courtesy of the executive secretary of the association, who devoted most of the space in a circular letter to a statement on "Improving Your Street Railway Service."

He pointed out that the railway is a business operated for profit. A shortage of cars hurts traffic. A surplus of cars means excessive operating expense. The problem is to keep the service adjusted to variations in demand. In view of these facts he requested the members to fill out and mail to him prepared postcards giving information concerning the number of men employed. It was particularly requested that large employers refrain from over-statement because the theory of securing "plenty of cars for every one" soon defeats its own purpose. It is one thing to say that a thousand men are employed and another to find that these men are on a three-day week and that only 500 are on the job at one time.

Replies received to this card covered some 200 plants employing from 300,000 to 400,000 men. During the two or three weeks following many facts of value to the traffic division came to the purchasing agent.

The Readers' Forum

Best Results in Energy Saving Made with Instruments

ECONOMY ELECTRIC DEVICES COMPANY
CHICAGO, ILL., Nov. 26, 1924.

To the Editors:

I have read with interest the abstract, on page 776 in the Nov. 1 issue, of the paper read by Wilhelm Pforr, manager Berlin Street Railways, before the International Electric Railway Association meeting at Homburg von der Höhe.

A hurried examination of this abstract would indicate that the author's findings were contrary to practices very widely adopted in the United States; but a more careful reading shows that Mr. Pforr's conclusions are based on his personal experience and are more or less contrary to the answers received to the questionnaire which he circulated with a view to summarizing opinions on the results obtained from all forms of energy-checking devices.

It is certain that the experiences of users of energy-checking devices in North America do not confirm Mr. Pforr's conclusions. Mr. Pforr finds that 30 per cent of the properties addressed were using instruments of some sort. In the United States approximately 25 per cent of the active motor cars are equipped with watt-hour meters and a substantial number are equipped with coasting time recorders or power-on time recorders. A large mass of data is therefore available in this country on which to base answers to the four points set forth by Mr. Pforr, who argues that it is better for his property and some others of similar size to encourage the saving of car propulsion energy by having additional power supervisors rather than by the joint use of energy-checking devices and power supervisors. He summarizes his objections as follows: (1) The appreciable expense of record-keeping personnel; (2) the maintenance cost of the instruments; (3) overloads occur oftener because the instruments tend to encourage high rates of acceleration and to discourage the series running, which is so valuable in congested areas; (4) false comparisons, which are drawn frequently, cause dissatisfaction among the motormen.

Our statements which follow are based on findings obtained over a period of 12 years use of Sangamo-Economy mercury type watt-hour meters with and without car inspection dials:

1. The average expense for clerical record keeping is less than $10 per meter year and this expense is made up largely of the accurate determination of all revenue car mileage. The results therefore are of value to the property in addition to simply that of checking the energy consumption. On some properties it has been found that a large part of this $10 was already being spent in obtaining car mileage.

2. The average expense for thoroughly maintaining—that is, cleaning and recalibrating—Economy watt-hour meters is less than $2 per meter per year, and the average cost for repair parts is less than 10 cents per meter per year.

3. Regarding the encouragement of high rates of acceleration and retardation through the use of a so-called "power-saving" device, the discussion of this point borders on competitive arguments between the devices which check a man through the use of the time element or by actual measurement of the energy. We argue that under the latter plan the watt-hour meter encourages rather than discourages series running and proper feeding of the controller in accordance with car and street traffic conditions. It does not put a premium on accelerating rates higher than those for which the electrical equipment of the car was originally designed.

I believe that the widespread experience in the United States has shown that not only with watt-hour meters but also with time-checking devices, the peaks at the substation bus are actually decreased. On one large property that made a special study of this, the 24-hour energy saving indicated through the use of meters at an average of 14 per cent, was accompanied by a reduction in the rush-hour peak of a little less than 10 per cent.

4. Under the system of rating the relative operating efficiencies of motormen through the use of the kilowatt-hour per car-mile, the meter does most of the engineering, and the question of false comparisions between men is hardly possible of justification when the usual operating constants are applied to the situation. With the kilowatt-hour as a unit the man is judged by what he does to avoid unnecessary losses and is measured by the actual expense he entails in the energy cost for operating his car.

We believe firmly in personal instruction, as Mr. Pforr recommends; but we have found that the best results cannot be obtained without the use of some checking device whereby a constant measure may be had on each motorman showing whether he is or is not following the instructions given. We have found that even where intensive instruction has been given, the use of the Economy watt-hour meter has increased the efficiency of operation from 10 to 20 per cent.

To summarize: Experience in this country, where more than 200 roads are using watt-hour meters as car energy checking devices, has shown that substantial savings result over and above those that can be obtained by the use of any number of instructors. This saving is far in excess of the overhead and operating costs. In fact, numerous roads have wiped off all operating and capital charges for the meters with the savings obtained during the first year. L. E. GOULD.

Association News & Discussions

Public Utility Problems Discussed in Pennsylvania

Relief from Paving Burdens, Quantity Production of Renewal Parts, Bus Operation, and Relations with Other Utilities Were Subjects at the Twentieth Annual Convention of the Pennsylvania Street Railway Association

DEPARTING somewhat from custom, the Pennsylvania Street Railway Association invited representatives of various municipalities to be present with the electric railway men of the state at their twentieth annual meeting at the Penn-Harris Hotel, Harrisburg, on Dec. 5. A lively interest in the proceedings was manifested by a number of the city officials who took part in the discussion which followed the presentation of papers.

An outstanding feature of the meeting was a paper on relief from paving burdens by A. T. Davison, general counsel Third Avenue Railway, New York City. An abstract appears elsewhere in this issue. In discussing Mr. Davison's paper, D. L. Starr, a member of the Traction Conference Board of Pennsylvania, urged a more complete presentation of facts to the public. He said that many points in Mr. Davison's paper were new to him and that he believed greater efforts should be made to give such information to the public. William LaFountaine, Director of Public Works, Scranton, Pa., said that the question of relief from paving burdens deserves careful consideration. The compromise suggested by Mr. Davison, whereby the city would construct the original paving between the tracks and the railway would maintain it, might be effected, he thought. The secretary of the Pennsylvania Chamber of Commerce said that the subject was one of great importance, and he would be glad to have all the available facts for presentation to the chamber.

Speaking of the relation of electric railways to other public utilities, P. H. Lantz, financial assistant to the president Philadelphia Company, Pittsburgh, said that in common with the other utilities the railways possess a huge investment and a relatively large number of employees coming in constant contact with the public. Their influence is tremendous in engendering and maintaining a friendly regard for their companies. The first step toward a better understanding of the motives of the railways and a better comprehension of their problems can well be taken by approaching those engaged in other public service occupations. They offer the distinct advantage of a sympathetic audience.

When new methods affecting customers are introduced, when schedules or routes are changed, when the rates are increased, nearly all human beings experience the same feeling. There is a natural disposition to criticise a change, and if not to resent it at least to question it. How does it sound, Mr. Lantz asked, to the man in the street, to hear an electric light man say that he "wonders what those fellows are up to now," when a street car schedule is changed? Or if a railway man is quite upset at the prospect of an advance in gas rates, it creates a bad impression. To some extent, people regard all those engaged in public utility service as pretty much in one class. They are supposed to have common characteristics. If those engaged in these services, therefore, are to be classed together, they should realize the advantages of standing together. In conclusion, Mr. Lantz told of the success which had attended the presentation of several short skits written with a view to showing the public some of the problems encountered by utility companies.

After mentioning the good results which were being obtained through the sale of securities to customers, Major J. S. S. Richardson, chairman of the Pennsylvania Public Service Information Committee, gave some good suggestions concerning publicity methods. He said that railway men should avoid the use of the phrase "educating the public." The public believes that it already is sufficiently educated and is not anxious for any more education handed out by the railway companies. In his opinion, the use of the phrase "informing the public" would avoid this difficulty.

Traffic problems were briefly discussed by Police Lieutenant Marshall, in charge of the traffic department in Pittsburgh. In his opinion, it is not feasible entirely to eliminate automobile parking. This, he considers, would interfere too greatly with the conduct of business. In Pittsburgh, by the establishment of a commercial unloading zone in the center of the block, it has been possible to prevent vehicles loading and unloading merchandise from standing alongside automobiles already parked and thus completely blocking the street.

A somewhat different point of view was expressed by C. F. Crane, assistant to the president Harrisburg Railways, who said that in Harrisburg the problem of traffic congestion is almost altogether a question of automobile parking. He thought that it was a matter of all or none, and that all automobile parking in downtown streets should be eliminated, just as all railway passes were eliminated some years ago when this abuse had grown intolerable. In the same way, the total elimination of parking would remedy the situation without discriminating against individuals.

The morning session was opened by an address from F. R. Phillips, president of the association. After dwelling briefly on the scope of the industry in Pennsylvania, he said: "There have been some who, because of the automobile and the bus, have felt that the electric railway has practically reached the limit of its usefulness. But when we consider that, in the year of the greatest expansion of the automobile and bus, the electric railways of this state increased their usefulness at the same or even at a greater rate than before, this should controvert any idea that they are going backward."

Mr. Phillips spoke also of the work of the various committees. The committee on legislative matters represented the interest of the association in hearings before the State Tax Commission. The committee on constitution and by-laws submitted a report clarifying certain portions of the constitution and by-laws. A committee on the joint use of poles was organized at the suggestion of the chief of the bureau of engineering of the Public Service Commission. The enthusiasm with which the committees have attacked their work has removed any doubt, Mr. Phillips said, as to the possibilities which exist for the association to be of real service to its members.

Reports were read by the secretary and treasurer and committees were appointed. A recommendation of the committee on constitution and by-laws suggesting that only one meeting a year be held instead of two, and that some minor changes be made in the matter of the dues, was approved. H. M. Stine, secretary of the association, warned of the difficulties that may ensue as a result of the attempt of the Pennsylvania Giant Power Survey to link together companies that are well situated geographically for this purpose but not equally well situated economically.

Commencing his remarks with the observation that maintenance is like the poor—with us always—Harry R. Meyer, development and supply division, Westinghouse Electric & Manufacturing Company, presented a paper on the advantage of buying renewal parts from the manufacturer most interested in their performance.

An abstract of this paper will appear in a future issue.

Bus operations of the United Electric Railways of Baltimore were outlined by L. H. Palmer, vice-president and general manager. He gave it as his opinion that buses are now a necessity and that their future utility lies in furnishing feeder and connecting line service. The possibilities of de luxe service he considers problematical. Special service and chartered buses may be a source of revenue to the operating company. Mr. Palmer spoke of the satisfactory results which have been obtained in Baltimore with inclosed double-deck buses. In conclusion, he emphasized the impossibility of buses handling mass transportation, in which connection the fact that the bus fare must be higher than the railway fare is an important consideration tending to limit the field of usefulness of the bus.

A telegram was received from Labert St. Clair, American Electric Railway Association, who was to have spoken on the subject "How Best to Sell Street Car Rides to Automobile Owners." The telegram summarized briefly the tenor of the remarks which Mr. St. Clair would have made, as follows: "Make comfort of street car riding rather than cost of running an automobile the basis of appeal to automobile owners. They resent being told that they cannot afford to run cars, the same as they resent being told they cannot afford fur coats for their wives. Stick to the comfort text. Say it briefly but often, and you will sell rides."

The meeting ended with a banquet, at which a number of prominent men of Pennsylvania spoke. Major Richardson added to his remarks made earlier in the day and stressed particularly the fact that information given out by the railways to the press must have real news value or it will not be published. As an example of the way that the time element affects news value, he told of a number of sensational stories that were running on the front pages of the newspapers in the summer of 1914 and how they were dropped overnight when Austria declared war on Serbia and Russia mobilized 14 army corps on the Austrian border.

John L. Stewart, member Pennsylvania Public Service Commission, spoke briefly concerning the efforts of the commission to promote at the same time the interests of the utility companies and of the public. A few reminiscences of the early days of the street railway industry were related by P. G. Wells, deputy attorney-general of Pennsylvania. The financial condition of the state was outlined in an address by Auditor-General Samuel Lewis. Mrs. C. M. Hughes, assistant to the vice-president of the Pennsylvania Section of the National Safety Council, spoke on the subject of safety. The concluding speaker was former Lieut.-Gov. E. E. Beidleman, who emphasized the need for more business sense in the conduct of every-day affairs.

The officers re-elected for the coming year included F. R. Phillips, president; W. F. Bell, vice-president, and Henry M. Stine, secretary and treasurer. On the executive committee F. R. Phillips, W. F. Bell, C. L. S. Tingley, Thomas Cooper and C. F. Crane were re-elected. New members of the executive committee will be H. L. Mitchell, West Penn Railways; J. L. Adams, Philadelphia & Western Railway; W. A. Woolford, General Electric Company, and Joseph Wayne, York Railways.

Let the City Pave and the Railway Maintain the Pavement*

By A. T. Davison

General Counsel Third Avenue Railway, New York City

IT WOULD be a waste of time to point out to street railway representatives the gross injustice of the archaic paving burdens under which the railways of the entire country, except in a few enlightened states, are literally staggering. The real question before us is, "What are we going to do about it."

At the outset, we should all realize that the real source from which our relief must come is public opinion. That is the strongest influence in the life of any community, state or nation. No legislature or set of officials can, in the final analysis, act counter to public opinion. Once we can convince the public of the gross injustice of this burden and of how vitally it is affected by it the relief will follow as a matter of course.

First, then, as to the form of relief which we should ask for. The best way to drive out a bad idea is to put a good idea in its place, and similarly, the best way to get rid of this iniquitous paving burden is to substitute for it a plan which is so fair and reasonable that no one can possibly object to it.

I believe that we cannot convince, at this time, a majority of the people that we should be relieved of all paving burdens. It may come in time, but it will only come after we have obtained a modification of the present drastic obligation.

Coming, then, to the specific form of relief which we should now ask for: The obligation on street railways to do any original paving should unquestionably be entirely eliminated. The justice and fairness of this is self-evident. It has been judicially recognized that street railway companies derive no special or peculiar benefit from the construction of the paving, and, as stated by the Street Railway Investigation Commission of Connecticut:

"The trolley car can run satisfactorily and give service to its patrons regardless of whether a street is paved or not."

Obviously, the only purpose of paving the railway area is to make it more convenient for purposes of travel by vehicles other than street cars.

The only reason ever advanced why street railways should do any paving has been that the operation of their cars caused a deterioration of the pavement. This might be an argument for an obligation to maintain a pavement after it has been laid, but certainly is no justification for requiring the street railway company to pay for the original pavement. The obligation to do original paving cannot be justified on any theory.

The idea, then, to instill into the minds of the public is this: that street railway companies should be required to restore to its former condition so much of the pavement of the street as shall have become in need of repair in consequence of the existence and use of their track.

The absolute fairness of such an obligation becomes the more apparent the more it is considered. It means that regardless of any specified railway area, if by any chance the companies because of the existence and use of their tracks in the streets, cause damage to the pavement anywhere between the curbs, they are to pay for that damage. Nothing could be fairer than this.

It may be that in numerous instances this form of relief will be given voluntarily by the municipalities, but it is important to bear in mind that in all the states of the Union this form of relief can be given by appropriate laws passed by the legislatures. There is no legal obstacle in the way of altering present paving obligations notwithstanding that such paving obligations are embodied in the franchise contracts themselves. The United States Supreme Court has upheld the authority of the state to alter the obligations contained in franchises granted by municipalities and accepted by street railroad companies, notwithstanding the argument that these franchise obligations were in the nature of contracts between the municipalities and the street railway companies.

Our approach to the public should be along the lines that the street car riders are the ones who are in reality bearing this paving burden, either directly by way of increased fares or indirectly by being deprived of service which otherwise they would have. We ought to make the people see that street railway corporations do not and cannot, under our regulatory and public service commission laws, use the streets for private profit. All moneys paid by street railways for paving obligations must be charged to operating expenses and paid out of the fares collected. Therefore, if the operating expenses of street railways must include paving obligations, the public is required to pay just that much more on its rate of fare.

Furthermore, we ought to tell the public how many passengers we are carrying on our lines each year and show them that if those persons were not carried on street cars they would necessarily be carried in other vehicles which would use the streets in greatly increased numbers and thus increase the wear on and deterioration of the pavement.

---

*Abstract of a paper presented at the convention of the Pennsylvania Street Railway Association, Harrisburg, Pa., Dec. 5.

Also, we should show that the tracks in the street are an asset to every community. These tracks are a guarantee to every business man and to prospective buyers of property that there is a permanent method of transportation in that locality, whereas if these tracks were removed and some other form of vehicular transportation were substituted, there is no guarantee that such other means of transportation will continue on that street. The street railways should explain how much of their income is paid to defray these paving obligations, and then compare these amounts with the taxes paid by other public utility corporations. We should also show that the amounts paid by street railway companies for paving do not render to the riders, who in reality pay these amounts, any more service than to the general public. Those who are really benefiting are the automobile users. We should make the car riders realize that they are paying the paving burden of the automobilist whose car they have just dodged at a street intersection or whose car is blocking their progress at the peak hour in congested territory.

We should show the public, and particularly the legislature, how absolutely fair the remedy we are asking for is, namely, that we should be required to restore to its former condition so much of the pavement as shall have become in need of repair in consequence of the existence and use of the track. In this connection, we should explain that if there is any damage caused by the weight of modern electric cars or vibration or flattened wheels or defective rolling stock, then the more that damage is, the more the company would be required to pay.

Furthermore, the obligation to maintain the pavement meets any claim that it is weakened at the points just adjacent to the tracks by reason of the lines of cleavage existing at such points, thus allowing considerable surface water to percolate through into the sub-surface and weaken the foundation of the roadbed. The remedy we propose fully meets this condition. The plan places a penalty on poor track construction and a premium on good track construction. Wherever we remove the pavement for track repairs we, of course, would be required to restore the pavement to its former condition.

And then, too, we should tell the public that in eleven states and one province in Canada a paving obligation has been adopted substantially in the form which we are now asking. In three of these states, Massachusetts, Rhode Island and Connecticut, the relief is statutory and state-wide. In the other eight states, Wisconsin, Washington, Kentucky, Indiana, California, Michigan, Illinois and Minnesota, and in the Province of Quebec, Canada, this form of relief has been adopted by one or more cities.

In the city of New York the Transit Commission has provided that the rate of fare on one of the lines in an outlying section shall be increased one cent for every $100,000 of paving which the company is required to pay. As a result, the paving program in that section has been very materially altered by the city authorities.

Of course the most important class of persons to be convinced are the members of the legislature. This, however, will follow of its own accord when public opinion has been sufficiently awakened. But until that time we should should improve all opportunities of getting information directly to the members of the legislature. One method of doing this and also of getting the matter before the public is to introduce in the legislature each year a bill which will give the relief which we are asking for. The introduction of this bill should be followed by hearings, and at all these hearings we have demonstrated in New York City that the only reason why relief has been withheld is the desire of the city authorities to levy and collect from street railways a large share of the municipal paving expenses even though it be iniquitous, unjust and an imposition on the car riders. This only emphasizes the point that public opinion must be so molded that this arbitrary retention of an unfair burden can be ended.

Operating Experience with Buses*

Various Sources of Trouble Are Pointed Out—Better Brakes, Provision for Overloads, Six-Cylinder Engines for Smoother Starting, More Dependable Tires, Larger Capacity Generators and High Maintenance Standards Needed

By B. Hilburn
General Manager Tulsa Street Railway,
Tulsa, Okla.

PERHAPS there is no more interesting subject relating to the transportation industry today than that of co-ordinating bus and street car service. The announcement in the October issue of *Bus Transportation* that 155 electric railways of the United States and Canada are operating 1,914 buses over 2,405 miles of route is conclusive evidence of the growing use of the bus by electric railway operators. It is also significant that more railways are operating buses in city service than in any other field.

Upon the advent of the unsightly jitney, without any semblance of regulation or responsibility, many of us unfortunately followed the practice of the ostrich and proceeded to cover our heads, in an attempt to ward off the danger of the approaching destructive competition. With our heads buried in the sand, we were unable to observe the rapid strides being made in the development of automotive equipment.

Before we realized it, many outsiders had begun to take advantage of the insistent demand for the newer mode of transportation. Where we have failed to supply this demand others have done it. It matters not that operation of the motor bus in city transportation has in most cases proved unprofitable; there are always those who are willing to take a chance. It is almost certain that ultimately a type of equipment will be designed that will prove practicable, and as operators get more experience many of the present operating problems will be solved. Therefore, it is absolutely essential that electric railways adopt the motor bus and proceed to find its place in the scheme of transportation. If this is not done there is grave danger of the business passing into other and more progressive hands.

Like many other street railways throughout the country, our city became infested with the "jitney" in 1914. The operation of this unsightly vehicle in competition with our lines has continued down to this day. There have been many attempts to eliminate them, but without any degree of success. We have had, and now have, a city administration that is willing to eliminate them, but the state laws have been such that any ordinance passed with that end in view has always been voided by the courts.

In 1922, in an effort to eliminate the jitneys from the streets, the city passed an ordinance requiring all auto buses, or automobiles being used in transportation service, to be of not less than 16-passenger seating capacity. This was done upon our agreement to operate motor buses on some of the lines where jitneys were operating and which reached territory not served by car lines. For the most part, the jitneys were covering routes that came in direct competition with the street cars. We purchased 15 Garford buses and one White Model 50. Six of the Garford buses were of 16-passenger capacity and the other nine Garfords, and the White had a seating capacity for 25 passengers.

We operated the buses on two routes. One was 2.7 miles long. An eight-minute headway was maintained throughout the day, with sufficient extra buses to give a 6-minute headway in the peak hours. On the other route, which was 2.5 miles long, we maintained a 6-minute headway throughout the day and added additional buses to give a 3½-minute headway in the peak hours. The operating results were satisfactory, until the jitney operators, after about three months, went into court and succeeded in having the ordinance voided. Then they went back onto the line with their buses. When the Supreme Court finally affirmed the decision of the lower court, we withdrew our buses and placed them on a route which was just half way between the jitney line and the street car line. However, this operation was unprofitable, and at the present time we are only operating buses as short extensions of two car lines. We are at present directing our efforts toward securing a new franchise, which, if the city grants, we think will take care of the jitney situation. Then we will probably be required to place in operation more buses to supplement our street car service.

---

*Abstract of paper presented before meeting of Midwest Electric Railway Association, St. Louis, Nov. 24, 25, 1924.

There seems to be no need to discuss the proposition as to whether buses are going to be used, because, in my opinion, that question is already settled. If the electric railway doesn't operate them, some other agency will. It means that losses are going to be incurred and that the electric railways are going to have to carry the burden, while the bus manufacturers do their experimenting and development. But it will be much better for the railways to get in on the ground floor than to let other agencies get the start, which would mean that the electric railways would suffer more than from the losses incurred during the development stage.

Therefore, it is apparent that we should put our shoulder to the wheel and exert our efforts toward solving the problems that are connected with the operation of the motor bus. And the Lord only knows, they are many. From the things I have read and the things that I have heard I have formed the impression that there are some operators of intercity or interurban buses who are making money. However, I have addressed letters of inquiry to many operators of buses in city transportation and have failed to find one who is actually making money on them. It is, I think, a favorable characteristic that most of them are optimistic. I may say that I have not included in my list the large independent operators, such as the Fifth Avenue Coach Company or the Chicago Motor Coach Company.

One of the most serious problems confronting the bus operator is the braking problem. While, no doubt, the automotive engineers have within the past year given this problem more consideration than in the past, I do not believe they yet realize the vast difference in the strain on the brakes on the bus compared with that on the ordinary service truck. The continued starting and stopping to take on and discharge passengers necessitates the use of the brakes many hundred times more per day than on a truck. And, too, if rapid schedules are to be maintained the use of the brake must be much more severe. I mean by that, the operator must run at a fast rate of speed up to the point where he is to stop, and then stop quickly. Some method of giving more braking surface must be developed, and material more durable than that now in use must be found. It is not the exception, but the general rule, that brakes in perfect condition when a bus goes out on its run will in a very short time be in such condition as to make the bus unsafe for operation. Much of this could be taken care of by proper adjustment provisions. When you are in the market for bus equipment, it will be wise for you to investigate thoroughly the braking apparatus.

Right along with the braking problem, I want to touch on the load capacity provisions. There has been no more serious mistake made by the bus manufacturers than that of underestimating the load capacity requirements. In most instances they have placed on the chassis a body which seats the entire number of passengers which the chassis is capable of carrying. It may be that under certain conditions loads can be limited to the seating capacity. It is most definite and certain that we cannot do that in our city, and I think the same condition holds true in most places. When you take into consideration the fact that more than 50 per cent of the traffic is handled in the peak hours, say from 6:30 to 8:30 in the morning, and from 4:30 to 6:30 in the afternoon, it can readily be seen that the equipment must carry overloads. If we should attempt to place in service sufficient additional equipment to provide seats for everybody in the rush hours, then the equipment could not possibly earn sufficient at current rates of fare to pay the operating expenses, because of the light traffic in the off-peak hours. So the bus manufacturers must so design their equipment that it will carry the overloads, just as the street cars have always done. And that is another thing you should go into carefully when purchasing bus equipment.

The constant starting and stopping of buses in city service is, perhaps, the cause of most of the mechanical troubles that occur. Therefore, automotive engineers should strive to achieve the utmost in flexibility of the driving mechanism of the equipment. I have discussed this feature with many of the engineers in the industry. It is my theory that a six-cylinder motor is preferable to the four-cylinder motor, in that it will afford a greater degree of smoothness in starting. We have never had much trouble with our motors, even though they have been greatly overloaded. But we have had much trouble from the clutch back to the rear end. It is my opinion that most all of this is due to rough starting. I have not always had the engineers agree with me that a six-cylinder motor would afford any relief. However, I note that some of them are now coming out with that type of motor. It will be exceedingly interesting to see how it works out. It may be that some sort of hydraulic clutch could be worked out to give greater flexibility.

When a bus gets so it does not start smoothly, and all buses will get that way as they grow older, then the process of battering at the transmission, universal joints and finally and probably most seriously the rear, or differential gears, begins. These shocks soon have an effect on hubs and wheel bearings.

Tires are also a serious matter. There is no doubt of the desirability of pneumatic tires from a resiliency standpoint. They are more comfortable to ride on and they are less destructive to the equipment. However, from the standpoint of regularity of service and dependability of service they are not so satisfactory. A flat tire is certain to lay the bus out for a trip, and this causes an interruption of the schedule. I think that in time a satisfactory type of solid cushion tire will be developed that will make the use of the pneumatic unnecessary, and when it is, that will do away with a lot of trouble.

Another important item is the electric generator. The current necessary to light up the interior agreeably, and at the same time keep the outside lights going, has proved such a drain on the batteries and generators on our equipment that they could not carry the load. That, no doubt, is being taken care of, but don't overlook that feature in your specifications. And let me remind you that while the manufacturers of bus equipment are earnestly striving to overcome all the difficulties, they are less familiar with transportation requirements than you are. They have for several years been engaged in the manufacture of equipment for use in other lines of business, in which the requirements cannot be compared with those of passenger transportation.

It seems entirely out of place to suggest to a body of street railway men the necessity for rigid inspection of equipment. Yet our experience has taught us that the maintenance problems of buses are so much greater than those of street cars that it has been difficult for our maintenance department to inspect frequently and thoroughly enough. There are so many more working parts in a motor bus, and so many more adjustments that the average mechanic is prone to release his job before all final adjustments are made. The work does not stand up, as does the mechanical work done on the street car. We have found that our bus maintenance requires much attention. Greatest effort should be made to keep complete harmony between the shopmen and the operators on the road. Friction between these two groups can cause much trouble.

C.E.R.A. Annual Meeting Jan. 8 and 9

THE annual meeting of the Central Electric Railway Association will be held Jan. 8 and 9, 1925, at the Miami Hotel, Dayton, Ohio. Following a meeting of the executive committee at 9 a.m. the sessions will be opened by the presidential address of Harry Reid, president of the association and president Interstate Public Service Company, Indianapolis.

After the presidential address, A. E. Magee, president Ohio Association for Prevention of Grade Crossing and Highway Accidents, will present a paper, "Elimination of Grade Crossing and Highway Accidents." The discussion on this paper will be led by Wallace Muir, Charles L. Henry and J. B. Dugan.

The report of a special committee appointed to review recommendations of state committees on elimination of grade crossing and highway accidents will be presented and followed by a general discussion.

In the afternoon the delegates will visit the McCook experimental flying field of the United States government.

The annual dinner will be held at 6:30 p.m. at the hotel.

The Friday session, which will be called to order at 9:30 a.m., will be devoted to the subject "Super-Power and the Railways," by E. H. Sniffin, manager power department Westinghouse Electric & Manufacturing Company. Following the discussion there will be an election of officers, and immediately after adjournment the new executive committee will meet.

Spheres of Motor and Railway Transport Discussed at New England Conference

Use of Buses and Trucks to Handle Traffic Formerly Carried at a Loss Described—Some Bus-Mile Costs Questioned—Co-ordination of All Transportation Agencies Urged

TO DEFINE better the fields of service of the steam railroad, the electric railway, the motor truck and the motor bus, a conference under the auspices of the National Automobile Chamber of Commerce was held at Boston, Mass., on Monday and Tuesday of this week. About 300 transportation men and public officials attended, among the speakers being a number of prominent electric railway executives.

At the opening session Frederic S. Snyder of Boston presided, and the first speaker was Alfred H. Swayne, president General Motors Corporation, who discussed "The Relation of Highway Transport to Other Transportation Facilities." He pointed out that New England is demanding better transportation facilities and at lower cost. Either the railroads, the electric railways and the existing independents will develop motor routes to meet present and future needs or outside groups will come in and build up a profitable business by giving this service. Road conditions in Massachusetts, Rhode Island and Connecticut are unusually well adapted to motor transport, which is largely confined to manufactured products of high value. More than two-thirds of the total motor truck movement is in distances of from 1 to 30 miles. Motor vehicle transport should be subject to the regulation of rates and service given other carriers. In taxation, the common carrier motor vehicle should be granted no favors which give it an undue advantage over the other agencies. The best interests of the public and the rail, waterway and motor interests lie in co-operation between them rather than in wasteful competition, and the greatest opportunity for co-operation is in the terminal areas of great cities.

C. L. Bardo, general manager of the New York, New Haven & Hartford Railroad, read a paper picturing the magnitude of the railroad industry in this country, the investment involved and the necessity of co-ordinating transportation by highway and rail to eliminate wasteful competition. He stated that the New Haven road stands ready to co-operate in the co-ordination of agencies for the better distribution of local traffic from the rail heads—particularly in the industrial centers and cities.

ELECTRIC RAILWAYS AND HIGHWAY TRANSPORT

A masterly résumé of the development of the electric railway and its economic place in modern life was presented by L. S. Storrs, president of the Connecticut Company, New Haven, Conn. An abstract of this paper is printed elsewhere in this issue.

"Independent Highway Transport" was discussed by James M. Swift of Boston, president Interstate Limited Motor Coach Company and counsel for the Motor Coach Association of New England. Mr. Swift outlined the demand of the public for bus transportation, declaring that it has come to stay, as it fills a new place in transport service.

A warm discussion of the place of the motor bus in New England occupied an afternoon session under the chairmanship of A. J. Brosseau, president Mack Trucks, Inc.

R. H. Newcomb, assistant to the vice-president New York, New Haven & Hartford Railroad, said that all steam railroad employees realize that the motor coach is here to stay. The railroads have consistently advocated the reduction of economically unsound competition and the real problem is one of co-ordination. It is unfair, said the speaker, that the bus should have no regulation whatever in Massachusetts, when the steam and electric roads have it. All forms of transportation should have the same general regulation. Taxation should also be levied on motor buses on a fair basis.

R. M. Sparks, vice-president Interstate Limited Motor Coach Company, sketched the development of highway transport up to the present day of bus application. He affirmed his belief in the special service rendered by the motor coach to the public and vigorously declared that this service will be maintained and expanded as fast as the traffic demands.

H. F. Fritch, Boston & Maine Railroad, said that his company is studying its unprofitable branch mileage with the possibility of doing away with train service and substituting the motor vehicle. The private automobile is a primary factor in the lack of patronage on these branches. He commended the firm stand of the electric railways of the country in 1919-1920 against the jitney, which led to success in the battle against these invaders. It is no proof, the speaker declared, that the bus is economically sound because the public patronizes it in particular localities. When equitable tax adjustments are made in relation to the motor bus, the allurements of this new form of transportation will diminish somewhat. A broad study of the entire passenger and freight carrying problem is essential to a solution of the motor bus situation.

A. R. Williams, counsel of the United Electric Railways, Providence, R. I., maintained that the field traversed by the motor bus is already served by steam or street railways. If these two agencies cannot afford to lose to the motor bus they will have to go out of business where the bus has taken the patronage. If the public has reached the period of non-regulation of any such transport agency as the motor bus, Sovietism once removed has arrived. It is impossible for the rail carrier economically to handle mass transportation unless it also handles the middle-of-the-day business. If the public really demands the privilege of riding on rubber the service should be properly regulated and rendered by existing carriers. The speaker charged that a motor bus line has taken one-third of the income of the New Haven road between Providence and Fall River.

Mr. Sparks said that New England is from 3 to 5 years behind the times in motor coach service. George H. Gariepy, Pawtucket (R. I.) Chamber of Commerce, bemoaned the increased cost of bus and trolley riding. In reply to an inquiry, Mr. Sparks said that his motor coach company proposes to develop the Providence-Fall River traffic to the utmost and to handle it the year round. T. H. Benton, of the Springfield, Mass., city transportation board, said that the city authorities approve granting the existing transport agencies the fullest opportunity to develop the forms of service required by the public before turning over such rights to others.

Clark V. Wood, president Springfield Street Railway, pointed out his willingness to supply any form of service acceptable to the public and for which the latter will pay a reasonable price. Fred A. Cummings, assistant to the chairman of the board of trustees, Eastern Massachusetts Street Railway, agreed that the motor coach has come to stay and said that his company is willing to operate any bus line so long as it yields 6 per cent on the investment and provides the required service. Bus operation will be put on wherever it proves more economical, but the company will not parallel a bus line where the latter is not under regulation.

H. B. Freeman, receiver Hartford & Springfield Street Railway, pointed out that buses on that road have superseded electric cars and are giving an improved service. The running time is now but 1 hour 20 minutes between the terminal cities against a former time of 2 hours 15 minutes by trolley. De luxe buses are operated on a fare of $1 each way. A new class of traffic is being developed, including business men formerly driving private automobiles over the route and women who refrained from boarding trolley cars in the center of the highways because of traffic density.

Mr. Freeman pointed out that the substitution of motor buses on the Asylum Avenue line in Hartford by the Connecticut Company has apparently reduced street congestion, partly as a result of the stopping of the buses at the curb. George E. Pellissier, Holyoke Street Railway, emphasized the need of more studies of costs, bearing in mind, however, that cost alone does not indicate the public's willingness to pay for a service. P. G. Carleton, counsel Eastern Massachusetts Street Railway, contended that the Massachusetts law should require independent buses to secure licenses from the Department of Public Utilities, as is required of electric railways before the latter can operate motor vehicles.

Mr. Williams pointed out that many communities would be in a serious transportation plight if the electric railways should take up certain local trackage, install bus service and then find the bus service inadequate. One cannot say how permanent the motor bus will be, at this time.

In closing the session, Chairman Brosseau said that a large majority of the motor vehicle manufacturers favor the state regulation of buses.

Edward Dana, general manager Boston Elevated Railway, presented the opening paper on Tuesday morning at the motor bus session on "The Economics of Motor Bus Operation." The author recounted the development of motor bus service on the Boston system and gave some significant data on the financial aspects of motor bus service on sparsely patronized trolley lines where the handling of mass transportation is not a feature of the day's work. An abstract of Mr. Dana's address is published elsewhere in this week's paper.

W. J. Flickinger, assistant to the president the Connecticut Company, New Haven, read a paper on the development and experience of his company in the motor bus field. This is abstracted elsewhere in this issue.

C. V. Wood, Springfield, Mass., said that the motor bus has been "sold" to the public and that the electric railways have been appointed the collectors, but some question exists as to the willingness of the public to pay the cost of such service in addition to street cars. H. W. Johnston of the New England Motor Tours Company, Arlington, Mass., said that his operating cost per mile, including taxes and all charges, is from 23 to 26 cents. These figures were vigorously questioned by several speakers, the consensus of opinion being that the cost of motor bus operation would run well over this amount in average practice. R. M. Sparks, Boston, supported the range of costs presented by Mr. Johnston. Mr. Dana again urged his hearers to beware of motor vehicle mileage cost statistics, on account of the immense range of conditions encountered. There is no more hazy subject in the electric railway field, he said, than undigested data on costs per vehicle or car-mile. Mr. Flickinger concurred, and after the statement that taxes and return on the investment were not included, said that the rough approximate cost per motor-vehicle-mile of the Connecticut Company's bus service is about 28 cents. F. A. Dean, Commerce Motor Truck Company, cited a cost per mile on one system for single-deck buses of 31 cents, and 38 to 39 cents for double-deckers. He cautioned his audience not to take "fly-by-night" estimates as their probable operation costs.

F. A. Cummings of the Eastern Massachusetts Street Railway said that no competition exists between his company and the Boston Elevated Railway over the Park Square-Arlington Heights bus route toward Lowell of the Eastern Massachusetts, as no local traffic is handled. It was maintained that little or no competition exists between the electric railway bus service in the eastern New England district and the steam railroad service.

A plan for uniting automobile motor truck and bus owners under the banner of the American Automobile Association was discussed by Ernest N. Smith, general manager of the A.A.A. Under the plan of organization two new departments will be created, a truck department and a motor bus department, with the necessary trained personnel. There will be no effort to compete with existing state organizations of truck and bus owners, but efforts will be directed toward co-operation with such organizations with a view toward solving national problems which continue to be a stumbling block to the freer use of commercial vehicles. There is at present considerable variation in truck tonnage laws, handicapping truck freight seriously in many quarters. Smoothing out matters of this sort will be among the many aims of the truck division of the A.A.A.

In its activities along legislative lines the new division will function through representation in the Motor Vehicle Conference Committee. At present the bus and truck owners of the country are not entitled to representation and cannot function in co-ordination with the committee because they are not represented by a national organization.

RESOLUTIONS SUM UP MEETING

Resolutions were adopted by the conference looking toward co-operation of rail, motor and water carriers rather than unregulated and wasteful competition. Other resolutions indorsed regulation of motor vehicle common carriers similar to that for other utilities, the requirement of certificates of public convenience and necessity and the requirement of adequate liability insurance.

It was resolved that taxes should consist of (a) state motor vehicle taxes, the proceeds of which should apply to highway maintenance; (b) taxes in exchange for franchise rights, providing an amount equivalent to that paid under the preceding item be deducted.

Uniform common carrier regulatory statutes throughout New England, and uniform regulation of highway traffic were recommended. Enabling legislation was recommended to permit steam railroads, trolleys and other public utilities to acquire, own and operate motor vehicles.

It was the sense of the conference that to promote co-operation of the various parties and co-ordinate railroad and truck service, a permanent committee should be created to be known as the New England Transportation Council. This should consist of equal representation from each of the several agencies represented in the conference, together with representatives of the general public.

The traffic program of the conference was summed up as follows:

Resolved: That it is the sense of the session that the approach to the problem of traffic congestion should be broadened to comprehend all the agencies contributing to or affected by transport traffic; that the traffic policy should develop the basic physical plan of the city; encourage higher efficiency and organization in traffic and transport operation and administration; that all large traffic centers should promptly organize for thorough study of their complete traffic-transport plan, in a manner best suited to the community, to the end that a broad co-operative effort of all groups of our city population may be secured to provide for both present relief and future needs.

Railway Operation of Buses in Connecticut*

Increasing Traffic Has Necessitated the Use of Larger Vehicles, but the Bus Has Been Found Unsuited for Mass Transportation—Maintenance Methods Are Described

BY W. J. FLICKINGER

Assistant to the President the Connecticut Company

WITH the policy of the state in regard to bus operation clearly defined, the management of this company was in a position to take advantage of the bus as an auxiliary. The first bus route was established in July, 1921, additional routes having been added, until at the present time we operate 15 bus routes in New Haven, Hartford, Stamford, Bridgeport, Westport, Waterbury, Meriden and New Britain. These are divided into three classes:

1. Extensions into unserved territory which had developed some distance from the rail facilities.
2. Replacement of trolley service on routes where the revenue was low and which were faced with the necessity of making large expenditures for track and overhead rehabilitation.
3. Between terminals where the highway offers a shorter route than the rail line which was built along a circuitous route to serve the greatest amount of intervening territory.

There is one other instance where it was necessary for passengers to travel from the north to the south part of the city over the main business street and numerous requests were made for an alternate route to avoid delays incident to the heavy traffic on the main street. This would have necessitated the construction of track at a cost of at least $125,000. A bus line about one-half mile in length, connecting with the rail lines, has satisfactorily met this situation at a much lower cost.

In the first two classes the rate of fare on the bus is the same as on the trolley, with free interchange of transfers. In the third class, the expedited service by the bus is recognized by a slightly higher rate.

Our original bus equipment included 3 27-Passenger Packards, 2 21-passenger Whites, 2 18-passenger Whites, 1 Duplex, 1 Mack and 19 Reo Speed

---

*Abstract of a paper presented at the New England Motor Transport Conference, Boston, Mass., Dec. 9.

Wagons, all on truck chassis with cheaply constructed bodies. By that time the motor truck industry and the body manufacturers became actively engaged in developing equipment which would be more suitable for the transportation of passengers than the truck and the lightly constructed, inconvenient and uncomfortable body. The first buses of improved type were purchased in November, 1921, to which new equipment has been added from time to time as required until at the present time we own 4 Pierce-Arrows, 2 Fageols, 8 Yellow Coaches, 2 Macks and 2 Whites with a seating capacity of 29, 10 Macks, 13 Whites and 5 Republics with a seating capacity of 25, 2 Whites with a seating capacity of 21, 1 White and 2 Brockways with a seating capacity of 18, 1 Duplex with a seating capacity of 20 and 8 Reos with a seating capacity of from 12 to 14, a total of 60 buses. This equipment, together with garage facilities, represents an investment of approximately $500,000.

At the close of 1922 we were operating 79,000 bus-miles per month; at the close of 1923, 92,000 bus-miles per month, and at the present time we are operating 134,000 bus-miles per month, an increase of nearly 70 per cent over 1922.

With the increase in traffic, we have found it necessary to discontinue nearly all of our 12 to 14-seat buses, substituting buses of larger capacity. We have also discontinued from passenger service all but three of the original buses which were on truck chassis. This investment was not, however, a total loss as we had for several years been working on a budget to motorize the line department, and the completion of this budget was made possible by converting this equipment into tower and signal maintenance trucks, in which service they will have some further years of usefulness. The amount which it was necessary to charge against bus equipment, therefore, was more a matter of obsolescence than depreciation.

In an industrial community such as we serve there is a very heavy peak load demand, which adds materially to the cost of the service because of the necessity for stand-by equipment. Under the law in Connecticut the maximum number of passengers allowed on a 25-passenger bus is 27 and on a 29-passenger bus 31, which makes the ratio between bus and trolley on the basis of carrying capacity 1 to 3. As an illustration of how this works in actual practice, we have one route serving a highly developed industrial community on which the traffic demands are such as to require 2 buses for 18 hours, 3 buses for 12 hours, 4 buses for 4 hours and 9 buses for one hour, so that we have 5 buses which operate only one hour out of 18, carrying only a one-way load; 1 which operates only 4 hours and one 12 hours, the 7 part-time buses operating only a total of 21 bus-hours per day. In the same city it requires 40 trolley cars to operate the base schedule, while during the peak-load period of about 2 hours 90 cars are required. Due to the lighter traffic in the off-peak hours, it would probably require a very few more buses than trolley cars to handle the traffic, but during the peak-load period of 2 hours it would require three times as many buses as trolley cars, or about 370 buses. This would result in an investment in over 200 buses for rush-hour service as against 50 trolley cars.

Going a little further and taking a concrete example, there is one industry located on the outskirts of the city at which 1,150 employees finish their day's work at the same time in the afternoon. These men are carried to the city in 14 trolley cars. To perform this same service would require 40 buses. I offer this as food for thought to any who may have conceived the idea that the time is not far away when buses will be the sole means of mass transportation, as it must be recognized, of course, that the transportation agency is under obligation to meet the full transportation requirements at all hours of the day and under all conditions.

I believe it is necessary to study the traffic situation very carefully on individual routes, as where the number of passengers on a bus at any one time is limited an increase in the size of the bus may produce a very desirable effect on the net revenue. I have one case in mind where the substitution of 29-passenger buses for 25-passenger increased the net several cents per bus-mile because additional business was there and all that was needed was the increased capacity for handling it without a corresponding increase in the bus mileage. There was practically no difference in the operating cost between the 25 and 29-passenger vehicles.

When we commenced to operate buses we felt that complete cost records would be necessary to guide us in making decisions from time to time, particularly as we were inexperienced and would have to watch results very carefully. Accordingly, we immediately established a classification of accounts along lines similar to those used in our railway accounting and gave detailed instructions as to the distribution of expenses to all of our employees having anything to do with bus operation. We have a detailed record of the maintenance and operating cost, gasoline and oil mileage of each individual bus, also the mileage of each individual tire. Having found the speedometer unreliable for the purpose of computing bus mileage, we have equipped each bus with a hubodometer, and the odometer readings are, from time to time, checked against the route mileage, to see that the odometers are in proper working order. As all of our costs are analyzed on a bus-mile basis, it is very important that we get the mileage as nearly accurate as possible. A failure to credit a bus with all mileage operated would give it an unfair disadvantage in making comparisons.

Each driver is provided with a card on which any defect developing is noted. The card is turned in with the bus at the end of the run and the defect is taken care of before the bus again goes on the road. In so far as possible, buses are assigned to the drivers. By this method, a driver is more careful in handling his bus and will give it a great many small attentions owing to his personal interest in it.

The scheduling and operation is under the supervision of the same subordinate official who has charge of the trolley operation, although where conditions require it street supervisors are assigned to bus operation exclusively. By this method the bus and trolley schedules are more readily co-ordinated to make a unified transportation system. I might say, incidentally, that between Dec. 1, 1923, and March 31, 1924, out of 37,700 scheduled bus-hours, our buses lost, due to mechanical troubles or bad road conditions, a total of only 92 hours.

The bus maintenance organization, so far as the chassis is concerned, is entirely separate from the organization which maintains the trolley cars. We believe this to be essential as the bus work requires an entirely different line of experience. The bodies, however, are practically the same as our trolley car bodies and they are maintained by the regular car shop organization.

We have a central garage in New Haven, which not only takes care of the maintenance of the New Haven buses but also has an overhauling shop where the buses from the entire system are taken for general overhauling, the bodies, however, being removed and overhauled in the local shop while the chassis is being overhauled in the central garage. The work on both is usually completed at about the same time and when the chassis goes back to its division the body is placed on it and it is then ready to return to service. So far, this arrangement seems to be working satisfactorily.

It is our practice thoroughly to inspect each bus every 7 days, at which time it is thoroughly greased and the crank case oil changed if necessary. We change the crank case oil every 1,500 miles.

While we have adopted no definite general overhauling schedule, we find that after a bus has operated between 50,000 and 60,000 miles it is to our advantage to take it down and renew all worn parts. In this connection we depend very largely on the judgment of our foreman as to the necessity for general overhauling as he is fairly familiar with the physical condition of each unit.

One item of expense which we have had to adopt more or less blindly is that of depreciation. We originally adopted the straight line depreciation basis over a period of three years. With the improvement in the type of equipment and the discovery that our buses would average from 35,000 to 40,000 miles per annum, we felt that our charge was too high, as with careful maintenance and periodical overhaul we felt we should get at least 200,000 miles per bus. Most manufacturers with whom I have discussed the matter claim that a greater mileage can be expected. We preferred, however, to be conservative and therefore adopted the mileage basis of depreciation on a life of 200,000 miles. If experience shows us that we will get a greater life, it will, of course, be a pleasure to change our depreciation basis.

It seems to me that the experience gained, not only in Connecticut but in nearly all of the other states where bus operation has for the past few years been a live issue, leads to the following conclusions:

1. That the bus is an established transportation facility, useful as an auxiliary to existing rail transportation in serving new territory where there is not sufficient revenue in sight to warrant the investment necessary to construct rail facilities, or to substitute for trolleys where rail facilities can no longer be maintained except with the expenditure of money out of all proportion to the earning capacity.
2. To permit competition between any forms of public transportation is an economic waste.
3. In territory where there is a chartered transportation agency, such agency, by reason of the training of its officers and employees, is equipped to meet best all of the transportation requirements and the people will receive at the hands of that agency a regular and dependable service.
4. Whether it be a street railway company operating rail cars or buses, or a legally established bus company, it is only by protection from competition and regulation by the constituted state authority that the investment in these enterprises can be safeguarded and the public receive the best transportation service at reasonable rates.

Economics of Motor Bus Operation*

On the Boston Elevated System Motor Buses Have Been Used Advantageously to Solve Difficult Situations—Overenthusiasm Warned Against

BY EDWARD DANA
General Manager Boston Elevated Railway

YOU have heard it said that the transportation of a modern city is necessarily a monopoly. I think the word in unfortunate, for it is a monopoly only in the same sense that our fire department, our police department or water department are necessary monopolies. Nevertheless, this is a well-established basic fact and because of its soundness there came into existence the regulating bodies clothed with the authority to insure fair treatment of the agency rendering transportation as well as to prevent those agencies practising upon those it served the evils of unregulated monopoly.

I am referring to these facts advisedly before attempting specifically to take up the motor bus itself because if the advocates of the motor bus are under the impression that this vehicle can change this basic principle they advocate a destructive transportation agency, and like most destructive agencies they usually contain the seeds of their own destruction within themselves.

Many motor bus advocates really believed that it would be possible to run counter to the basic principles which had been developed during the last quarter of a century in this country. They put lines in operation and ran them only when the greatest opportunity to get traffic existed. With such a load factor, the elements were in existence to assure a low fare and they gave low fares and usurped the street railway business and at the same time created new business.

Let us examine this condition and apply it under our basic principles. A street railway system functions for the entire area served. It has to maintain a readiness to serve over the entire district and cars are operated 18 to 20 hours a day, 365 days a year, regardless of the amount of traffic, for the good of the district as a whole. For instance, the Boston Elevated carries 1,100,000 passengers on a week day and runs 161,000 car-miles. On a Sunday it carries only 600,000 but runs 108,000 car-miles. The receipts on Sunday are 14 cents per car-mile less than on weekdays. That is what I mean by readiness to serve.

Suppose, for instance, that the street railway was not affected by the basic principles I have referred to, but instead functioned according to the underlying principle which is characterized by the jitney line I referred to, what would result? Some lines would have a low fare of 5 cents and other lines would have a fare of possibly 25 cents if they were to have any service at all.

Now let us turn to the constructive aspect of the motor bus. The economics of the motor bus comes down to the management of a new tool to do work which has been done in some instances with an improper tool and to do work for which we were not equipped with any tool before.

The motor bus, it would seem, has established its place as a part of a unified transportation system. It has its proper place, just as does a one-man car or a two-man car or a multiple-unit train. In 1923, 95 railways operated 925 buses. I understand today 168 railways operate 2,633 or more buses. Progressive railway officials apparently see that in the motor bus there exists a very useful ally to the electrically operated units. A combination of facilities is therefore afforded which can give the traveling public the service which can best serve its needs.

The story of the motor bus as it has unfolded in the territory served by the Boston Elevated Railway may be of interest generally.

Under the 1918 act, the Elevated was required to be operated on a service-at-cost basis and fares were increased. On July 10, 1919, a flat 10-cent fare had been reached. This flat fare was accompanied by a substantial decrease in revenue passengers, even though the fare was sufficient to prevent deficits and cover the full cost of service.

Naturally, there has been some discussion and advocacy of competitive buses, but the assessment against the taxpayers of $3,980,151.67 for the first year's deficit under public operation and the fact that this amount had to be repaid before fares could be decreased had a very real effect upon those in authority by whose action motor buses could be permitted.

The consequences of the act were understood by most municipal officers, and it was realized that if competitive motor buses were permitted and the revenue of this great system diminished one of three things must occur under the laws:

1. An increase in fare above 10 cents to offset the loss, or
2. Additional deficits against the taxpayers, or
3. Loss of service in the district affected, in an effort by the state trustees to localize the competition and place no burden upon the system as a whole which might result in a higher fare or a tax assessment.

The result was that the cities and towns refused licenses to competitive jitneys with a single exception, where the city later revoked the competitive jitney license.

The Boston Elevated Railway began the operation of motor buses on Feb. 24, 1922, between Union Square, Brighton, and the Boston-Watertown line on North Beacon Street. Bus service has increased from that time and we are now operating bus lines requiring for regular schedules 46 buses and for extra service a total of 66 buses. During the month of October we operated 97,680 bus-miles and carried 676,005 passengers in buses.

As an instance of the use of this new ally on the Boston Elevated Railway the so-called Cottage Farm line may be cited. This line was 2.219 miles long, operated through narrow streets and served 3,600 people in both directions daily. The rebuilding of the Cottage Farm Bridge was up for consideration. Following established custom the car rider was to be assessed approximately $60,000 of the cost. The rebuilding of the tracks over which the line operated would cost $180,000. The 8 cars on the line represented a capital outlay for both car and power plant capacity of approximately $200,000. To serve 3,600 people by cars a plant investment was called for of $440,000. The plant investment if buses were to be substituted would not exceed $100,000, a fixed charge saving of no inconsiderable proportion.

Referring again to the use of a tool, why use a sledgehammer if a tack-hammer will get results? Or in railway vernacular, why put the Twentieth Century on the Skowhegan branch?

But let not the pendulum swing on the strength of such a performance and bus enthusiasts rush in where angels fear to tread and proclaim its ability to supplant, replace and relegate to the Dark Ages the mass transportation agency—the street railway—than which no more economical agency exists today to perform its task. Ridiculous and absurb. We might as well urge that a Ford was all that is necessary in the form of an automobile, so why have so many other makes.

I referred to the hope of new territory in the use of the motor vehicle. The Boston Elevated has several lines of this very character where no previous trolley service existed but where today the district is served as an integral part of the Elevated system.

---

*Abstract of a paper before the New England Motor Transport Conference, Boston, Mass., Dec. 9, 1924.

There is still another use, the ultimate development of which by street railways has not been appreciated, and that is chartered bus service. Street railway service of this sort was limited by the proximity of the terminal points of the trip to car lines. The bus removes this limitation and permits the street railway to utilize its personnel and its equipment when not otherwise engaged, except for the very peak hour.

Summarized, therefore, the bus in some instances can replace trolley lines; in others, reach out into new territory, and in a third way become a business getter in the way of special parties.

As regards the vehicle itself, its mechanical efficiency and its appointments for the service to be rendered opens up a fascinating field for a multitude of detailed discussion. Suffice it to say that I have unlimited confidence in the enthusiasm and the ability of the motor vehicle builders to co-operate, study and improve almost from day to day this agency once the underlying basic principles of its regulation, control and field have been definitely indicated.

But there is one thought which comes to my mind in this connection, and that is that over the doors of most Roman villas there usually was an inscription, *Cave Canum*, which, translated, means "Beware of the dog," and I offer for the consideration of the bus men an inscription over the door of the electric railway, "Beware of bus-mile statistics."

Providing Complete Transportation Service*

There Are Many Uses of the Bus in Connection with the Electric Railway and the Two Should Be Used Together Where Best Suited

By L. S. Storrs
President the Connecticut Company,
New Haven, Conn.

One often hears the statement that the electric railways are in a transition period. To a certain extent this is true, but this utility has constantly undergone change. From the days of the horse car, one modification after another has been adopted in the effort to keep ahead of the reasonable requirements of the communities.

In an effort to supply necessary public service and in order that full transportation facilities may be offered, railways are rapidly adopting the motor bus as an auxiliary. At the present time there are at least 3,000 motor buses operated by electric railways in the United States, 300 of which are in New England.

The task confronting the transportation utility is not that of providing regular service to the people of the cities during the 18 to 24 hours of the day, for that would only mean running cars over the tracks on even schedules, a relatively simple matter. The real job of this servant of the people is providing sufficient service to take care of their needs in going to work in the morning and returning home in the afternoon.

This mass transportation period is but four hours in duration, or at the most four and one-half hours, during which approximately one-half of the total daily passengers must be taken care of. That is, of the 44,000,000 passengers per day in the United States, at least 20,000,000 must be transported in 4 hours, or at the rate of 5,000,000 per hour.

This mass movement is the real problem, and one that large-capacity cars, or trains, running along the streets of our cities or through subways or upon elevated structures in the metropolitan areas, alone can cope with. The requirement for added facilities to take care of this mass movement in the growing American cities is ever confronting the transportation executives.

We are so familiar with the inconvenience in travel, during the peak hours, in street cars or subway, that the common impulse is to complain of the service or criticise the management when as a fact the most efficient service is being rendered. Either the subway facility is taxed way beyond the capacity which it was expected to care for when planned; or the number of street cars, operated through streets already congested to the point of saturation, will not permit any further addition. But try to visualize the results with bus operation. I have in mind one of the bus routes in Connecticut on which the travel requires the following service:

For 18 hours, two buses; for 12 hours, three buses; for 4 hours, four buses, and for 1 hour, nine buses. So we have five buses which operate only 1 hour out of 18 carrying a one-way load; one which operates only 4 hours and one 12 hours, the seven part-time buses operating only a total of 21 hours per day. This is mass transportation with a vengeance—and it is a nice question as to whether rail transportation to serve this route would not be more efficient and economical.

The great growth of American cities has been made possible solely through a thoroughly efficient and dependable system of transportation. Dependable service, not only that of today, but throughout the days to come, cannot be obtained unless supplied by a responsible organization depending upon its patronage for its own financial success. If the service is rendered by groups of individuals jointly, or by each in his own interest there can be no assurance of continued service. It will depend upon the personal whims or ability to carry on, and that solely during periods of prosperous operation.

In any city there are lean areas from the transportation standpoint through which dependable service is as much of a necessity as it is in the districts that make possible profitable operations. Complete service through all portions of a city is needed for the growth of the city.

The development of the motor bus has placed in the control of the electric railways a very efficient aid in providing improved service in the cities and surrounding districts. The greater flexibility of a transportation unit which is not confined to fixed routes, makes it possible to extend service into areas that have been developed since the electric railway trackage was constructed, and, by co-ordinating that service with street railway service, give a more adequate facility to the community.

It must be apparent that the need for a well-planned system of transportation within any community must include all types of service that the present stage of the art has developed; that each type of service must be utilized in that particular work which it is best designed to perform; that both types must be placed under the same obligations and restrictions; and that both must be under the identical regulatory body in order that the ultimate end of a perfect transportation system may be attained.

By far the best results are possible when both types of service are operated under the control of one transportation organization with the obligation to make the most efficient use of each. Only under such a policy can a thoroughly co-ordinated service be produced and the maximum benefits obtained.

A great deal has been said of the probable substitution of the motor bus for the electric cars, but it is apparent that the bus is not capable of efficiently serving mass transportation in the large cities. It is equally apparent that there are many uses to which this unit can be put in providing essential service, and the electric railways must be prepared to adopt the motor bus as an integral part of their plant, and by adopting a broad view of their obligations abandon the idea of being merely electric railways and take on their real function, that of being the agents of the public in supplying all of the transportation requirements of the communities.

The time has come for the use of the bus by the experts. It can be made to be of great service, but its full utility cannot be determined until serious efforts have been made thoroughly to co-ordinate the two types of service. This new facility is as yet too recent a development for anyone to predict with any degree of certainty the particular instances of its actual value in the general transportation needs of any city. The efforts that have thus far been made to co-ordinate the bus service with existing trolley service are of too recent date to have more than pointed the way to possible other uses.

Without question the first obligation of the railway is to fill the unserved areas, after which there is the gradual opportunity to economize by substitution of the motor bus for electric cars in thin traffic areas, when confronted with excessive track reconstruction expenditures. There are opportunities to develop new business by a combination of the above two bus operations. The possession of a sufficient fleet of bus units will develop the incentive to find new uses for these units. While it is unlikely that there will ever be a large amount of supersession of the street cars by the bus in city areas of dense riding, experience in the actual cost of bus operation as compared with the cost of operation and upkeep of electric railway plants will serve as a guide to direct the gradual expansion of bus operations.

---

*Abstract of a paper read at the New England Motor Transport Conference, Boston, Mass., Dec. 9, 1924.

There is a field for the development of a higher grade of service than that possible in mass transportation, or what has come to be termed de luxe service, at rates considerably higher than traction fares, as well as high grade special service along non-served routes, such as that performed by the Fifth Avenue Coach Company, at slightly higher rates. These are all matters that the transportation experts should determine, but it is certain that they will be determined by someone.

It has been said that the good will of the community is the greatest single asset of a public utility and no steps can possibly be taken that will be productive of so large a measure of this good will as the adoption by the railway of the bus and the active development of such service necessities as exist within the various communities.

There is one phase of the matter that warrants serious consideration, the result upon the securities of the electric railway, provided there is any large amount of substitution. The superseded physical property has a definite value which is represented by issues of stock or bonds. It will be necessary to permit the new service to earn a net in excess of the allowed "fair return" sufficient to amortize the physical value so superseded over a term of years. This is but one of the problems that will be presented during the period of readjustment.

The experience of electric railway companies in New England with bus operation has encouraged some of us to believe that we shall be operating many more buses in the near future. At the same time, we have no reason to believe that the bus will supersede the electric railway in its most important function—the carrying of the millions of persons to and from work during the rush hours of the day.

New Englanders Discuss Maintenance and Employee Relations

SO MUCH interest was aroused in the subject of rolling stock maintenance at the November meeting of the New England Street Railway Club that at the meeting on Dec. 4 another paper was presented on this topic by H. S. Day, Westinghouse Electric & Manufacturing Company, Boston, Mass. President T. H. Kendrigan occupied the chair. Mr. Day's paper will be published next week.

In opening the discussion President Kendrigan pointed out that a sleet storm is hardest on railway motors and that where snow is dry much less difficulty is encountered in maintaining service. Mr. Day admitted the influence of weather effect on motors, but declared if the insulation of motor coils is well varnished and if the snow-fighting equipment is in good shape, much less trouble will occur than where poorer maintenance holds sway. Good maintenance implies that field coils are properly dipped and baked, that insulation is "live," motors are tight and that the roads are open. It is a pity to diminish service during storms for on these occasions many opportunities arise to carry patrons who ordinarily use private automobiles.

W. C. Bolt, Eastern Massachusetts Street Railway, Boston, said that he is studying the problem of when to replace old with new equipment and Mr. Day stated that he is making a similar investigation.

John Lindall, Boston Elevated Railway, concurred in the value of systematic inspection and overhauling, but declared that local service conditions are often controlling. In the same city a single storm will sometimes tie up the cars on one division and leave those on another free from interrupted service. Poor track is responsible for a multitude of car failures, and after track is relaid it often happens that the pull-ins in a district begin to diminish after a few months' service over the new rails. "Two years ago," said Mr. Lindall, "we had 300 motors that gave us a good deal of trouble and I recommended their replacement but could get only money enough to replace 100. We took out the worst motors and put the new ones into the hardest service. This step has reduced maintenance costs on these 75 cars so much that I question whether I could now make out a case for replacing the other 200 motors."

Mr. Bolt emphasized the generally good condition of tracks on the Eastern Massachusetts system as a factor in lowered car repairs. Special attention has been given to drainage to prevent water accumulating on the tracks. Nothing is more damaging to a motor than salt water. Passenger car equipment is not built for snow fighting, and an adequate snow-fighting equipment is important as a factor in relation to car maintenance. In a typical storm eight to twelve motors were burned out on one car line in 2 or 3 hours where the snow had not been properly removed, and yet there were no motor failures on the rest of the system where similar cars were operating.

F. B. Walker, chief engineer of maintenance Eastern Massachusetts system, pointed out the importance of keeping up the voltage in reducing car pull-ins from motor burnouts. Of 180,000 joints on the system about 125,000 have been replaced and many bonds test 100 per cent in conductivity. "We credit our department," said he, "with about $100,000 in motor repair savings as a result of joint and bond maintenance." R. D. Hood, Haverhill, Mass., said that much good has been effected by the use of negative feeders. In hard winds it is the practice on the Massachusetts Northeastern to put up the voltage to 650 and fewer motor failures result.

Following the usual dinner, S. F. Fannon, director division of public service, Sherman Service, Inc., Boston, addressed the club on "A New Conception of the Job," and Prof. T. N. Carver of the department of economics, Harvard University, gave a talk on "Economic Tendencies." Mr. Fannon's paper appears elsewhere in this issue.

Professor Carver depicted the causes of many modern economic wastes and emphasized the trend toward their reduction resulting from the diffusion of wealth, employee and customer ownership. He predicted further advances in the cost of labor in this country, but drew the conclusion that as relations improve and as the investing class increases in numbers many present causes of conflict will disappear.

Kentucky Association Meets Jan. 15-16

THE annual meeting of the Kentucky Association of Public Utilities will meet at the Seelbach Hotel, Louisville, on Jan. 15 and 16. There will be a get-together dinner for members on the night of Jan. 15, with an all-day business conference on Jan. 16.

American Association News

Special Reports Available

THE following special reports have been prepared by the Bureau of Information and Service and are available to member companies in good standing upon request:

Motor Bus Operations in the United States.—List of motor bus lines showing name and address of the operators and where the information is available, statistical data on the character of their operations. Part I, motor bus lines in Arizona, Colorado, Connecticut, Delaware (Wilmington), Indiana, District of Columbia, Maine, Maryland, Michigan, New Hampshire, North Dakota, Rhode Island, Utah, Vermont, Wisconsin, Wyoming.

Accident Statistics of Electric Railways for 1923.—Analysis and summary of the statistical data on accidents reported by more than 150 companies on association questionnaire. The information covers the number of accidents, ratio of cost to gross earnings and comparison of accident records on unit bases, all of which is also compared with the record for the year 1922. A summary of safety work carried on by electric railways is also included.

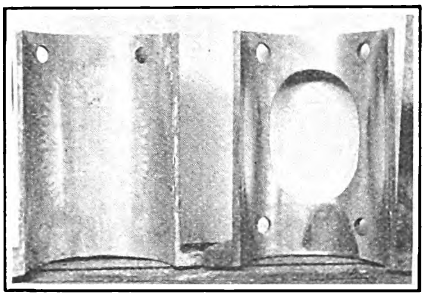
In addition to the above, supplements to the Wage Bulletin, Fare Bulletin and Cost of Living Studies have been prepared, bringing them up to date.

Maintenance of Equipment

Utilizing Worn Axle Brasses

OBTAINING double life out of split axle brasses by replacing the worn top half of the lining with the bottom half is accomplished in the Wheaton shops of the Chicago, Aurora & Elgin Railroad. Finding that an excess supply of lower halves of axle lining were accumulating, an investigation was made to see if they could not be used for some other purpose. By filling in the bearing window with babbitt, and building up the flange by welding, it was possible to utilize the bottom half as a top half. The accompanying illustration shows a babbitt lined split bearing before and after closing the window with babbitt.

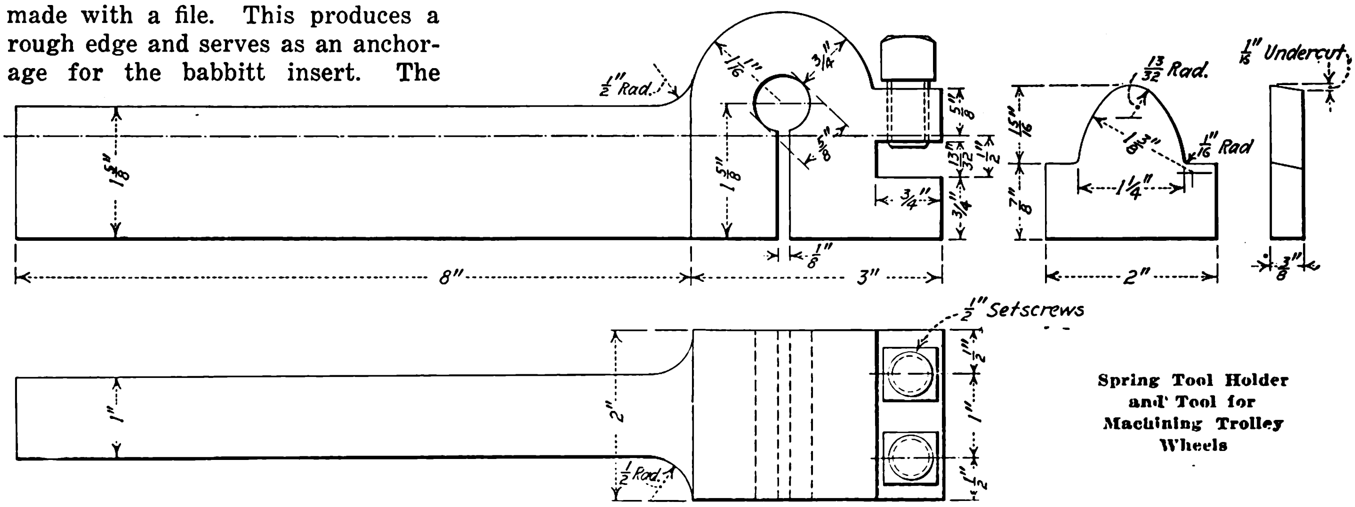
The edges of the window are serrated by means of indentations made with a file. This produces a rough edge and serves as an anchorage for the babbitt insert. The bearing is then placed around a mandrel and the window poured full of babbitt. It is machined inside and out, and is suitable for use as an upper half of an axle bearing. This practice has resulted in the use of material which heretofore had been considered scrap.



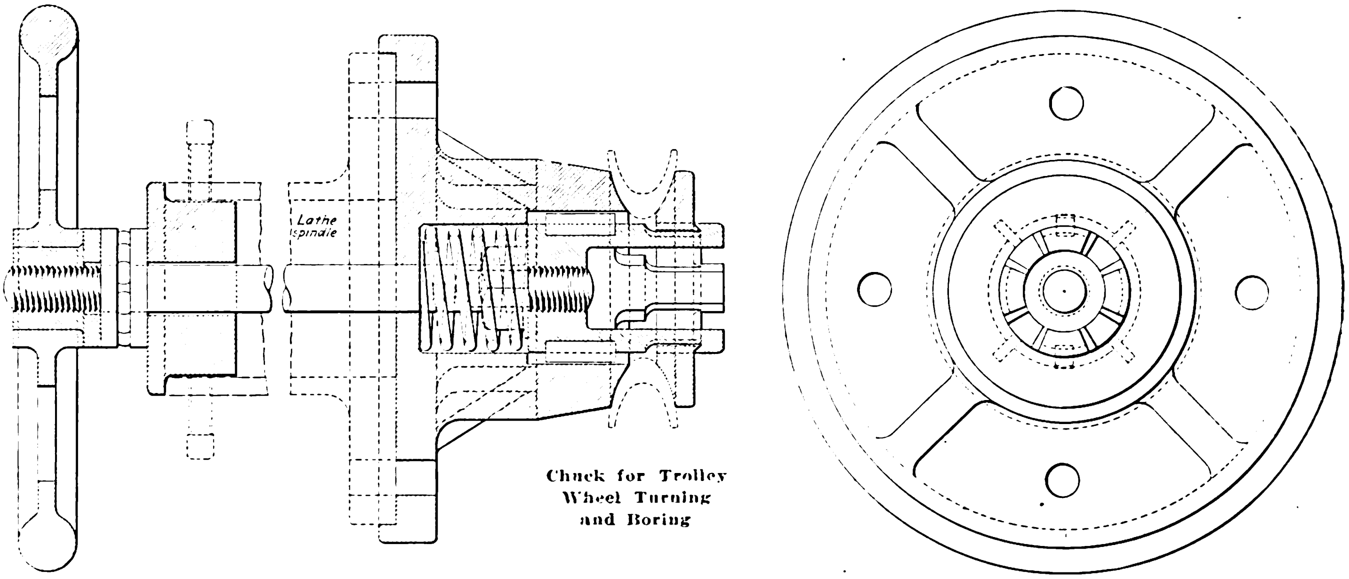
Bottom Half Axle-Lining Brass with Window Babbitted for Use as a Top Half

Chuck for Machining Trolley Wheels

IN THE new Hillcrest shops of the Toronto Transportation Commission, Toronto, Canada, a new form of chuck has been developed that makes it possible to bore and turn trolley wheels at one operation. The main casting of the chuck is attached to the lathe, and the outer end is turned to fit the inside contour of the trolley wheel. An arbor fits inside the main casting which is arranged with arms which project through the spokes of the wheel, and these in turn are provided with projections to act as chuck jaws. A locking ring with slots to fit over the chuck jaws is shaped to fit inside the contour of the trolley wheel and hold it firmly



Spring Tool Holder and Tool for Machining Trolley Wheels



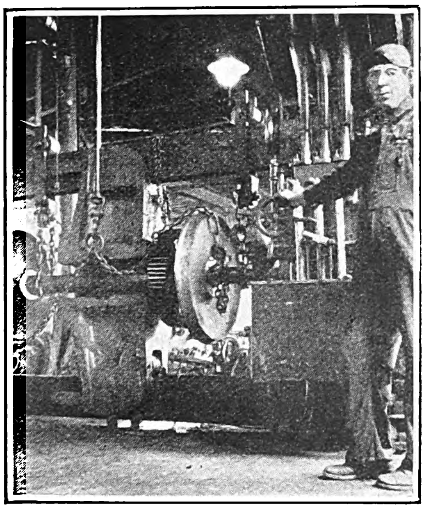
Chuck for Trolley Wheel Turning and Boring

when in position. After the trolley wheel is inserted, the retaining ring can be shoved over the chuck jaw and then with a 45-deg. turn the retaining ring is locked so as to hold the wheel tight. With this design of chuck, both the hub of the wheel and the grooved portion are left free for machining.

The groove is turned in the wheel by a special tool, as shown in the accompanying illustration. This gives the correct shape in one operation. The tool holder is arranged with a slot so as to provide a spring action. Use of this chuck, together with the special tool, has made it possible to maintain trolley wheels at a much reduced cost, and in addition, they are uniform in size and shape. The chuck was designed under the supervision of W. R. McRae, superintendent of rolling stock.

Wheel and Gear Pressed Off Together

IT IS the practice in the Albany Street shops of the Boston Elevated Railway to press wheels and gears on and off together. This is done on a Wood hydraulic press, which is arranged as shown in an accompanying illustration. An axle with wheels and gear attached is swung into position in the machine. The gear rests against the large block in the center, while pressure is applied to the end of the axle at the right. For 33-in. wheels a force of about 130 tons is required for pressing off.



Gears and Wheels Are Pressed Off Together by a Hydraulic Machine in the Boston "L" Shops

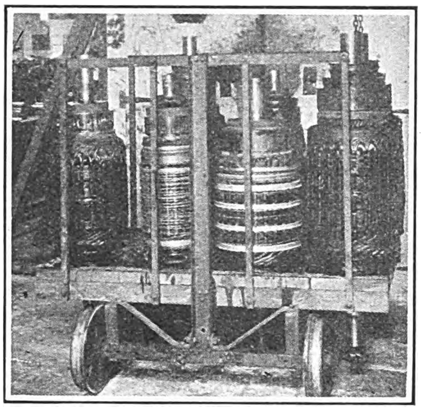
When it is desired to press off a wheel without removing the gear also, the force is applied at the rim. This procedure destroys the shape of the wheel, but inasmuch as the wheel is to be scrapped anyhow this is no drawback. No pressing is ever done by means of rods placed through holes in the web of the gear.

Special Truck for Baking Armatures on End

By F. C. Lynch

Shop Supervisor Kansas City Railways

THE accompanying illustration shows a small truck used by the Kansas City Railways for moving armatures in and out of the baking oven, and for storing them while they are in the oven. Two trucks of the same design are used for this work.



This Simple Truck Enables Armatures to Be Conveniently Handled on End in Connection with Dipping and Baking Work

Armatures are dipped with the pinion end down, and are stored in this same position on the baking truck. The truck itself is made up of angle-iron framing, mounted on cast-iron flanged wheels. A wood floor is bored out so that the pinion and that end of the shaft protrudes through. It has a capacity for eight of the larger sized armatures.

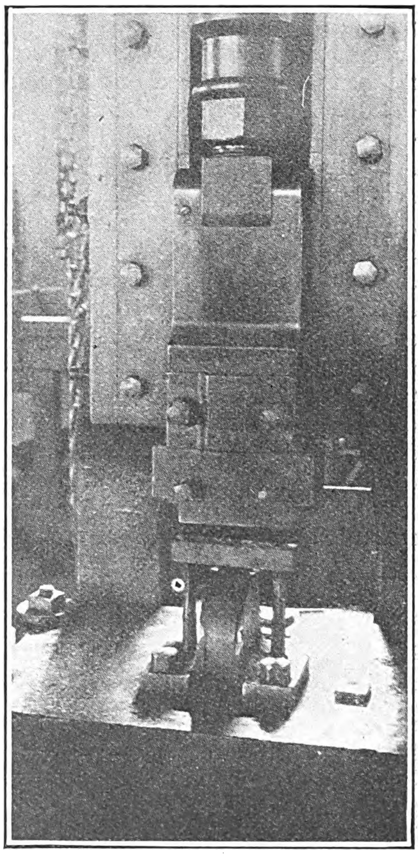
Burning Insulation Off Flat Conductors

WHERE strap-wound field coils are to be rewound or repaired the removal of the old insulation presents quite a problem. In the shops of the United Traction Company, Albany, N. Y., this is accomplished by passing the insulated conductor through a gas flame and then drawing it through a pair of rotating wire brushes. In order that the gas flame may extend along a section of the insulated conductor the flame is fed into a cylinder and the insulated conductor is pulled through this. Immediately after it comes out of the gas flame it passes between the motor-driven wire brushes, which remove any remnants of insulation and clean the conductor. A galvanized iron housing around the brushes prevents the dust and refuse from flying about.

Salvaging Controller Segments

WHEN the ends of the longer controller segments become burned from arcing, it is the practice of the mechanical department of the Twin City Rapid Transit Company to shear off the burned ends and utilize the pieces thus salvaged for replacement of some of the smaller segments on the controller cylinder.

Due to the curved contour of the segments this is a rather awkward shearing job. A simple shearing jig shown in the accompanying illustration speeds up this work materially. It consists of a small curved block of the proper shape to fit the segment which is to be cut off, and has a guard under which the segment fits. The outfit is set up in a punch press.



The Burned Ends of Long Controller Contact Segments Are Sheared Off in a Simple Jig, Set Up in a Punch Press in the Twin City Rapid Transit Company's Shop

New Equipment Available

Improved Door Operator

MANY improvements in design and refinements in manufacture have been incorporated in its latest type of door operator for folding doors and steps by the Consolidated Car Heating Company, Albany, N. Y. By providing for installation of the door engine so that its shaft will be vertical, the levers that operate the door are brought into a horizontal position. This insures a tight fit at all joints and minimizes wear. On installations with doors of the usual size but two ¼-in. air pipes are needed to serve the door engine. Phosphor-bronze bearing liners are provided for the operating shaft, and a honed finish is given the inside of the cylinder in which the piston slides.

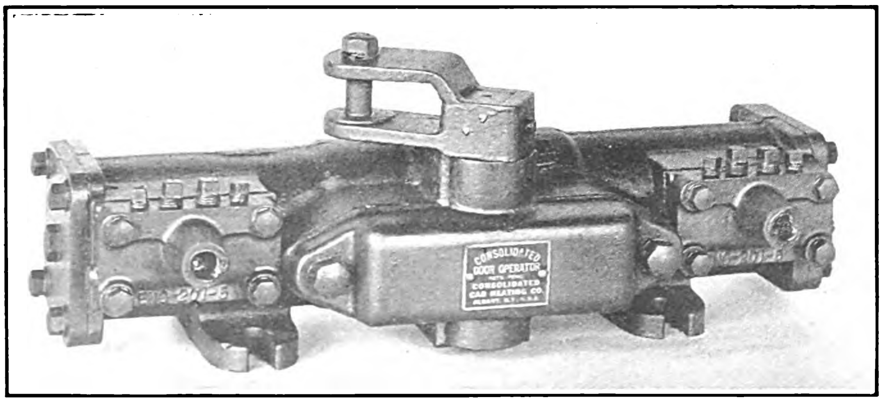
The connection between the operating shaft and the piston is through a quadrant gear and rack, which constitutes the spindle for the pistons. A hexagonal fit between the gear and shaft insures an accurate fit without likelihood of wear. By removing the cover, which is held in place by two cap screws, the gear and shaft can be lifted out for inspection. In operation, the chamber about the gear is kept filled with a light grease. This can be replenished from a grease gun through a hole with filling plug without disturbing other parts of the door engine. The gear and rack have machine-cut teeth, which insure smooth operation and long life.

The piston leathers and phosphor-bronze expanders at the ends of the rack are held in place by nuts. The exhaust end of the rack is provided with a by-pass valve which prevents pressure building up in the closing cylinder while the door is being shut.

If closure of the door is stopped by a passenger or some obstruction the air is vented to the atmosphere from the closing cylinder, so that when the obstruction is removed the door continues to close at regular speed with no tendency to slam. The by-pass has a ball valve held against its seat by spring pressure. With the door fully closed this spring pressure is increased to prevent operation of the by-pass. This construction permits the use of separate speed control valves, so that the door-closing speed can be adjusted independently of the cushioning, which slows down movement of the door just as it reaches the end of its stroke. These adjustable speed-control valves provide for regulation of the speed with which the air is exhausted from the cylinder, while there is no check on the speed with which air is admitted.

The door engines are controlled either by a straight pneumatic control valve or electrically by push buttons. On cars provided with Safety Car Devices equipment the engine is controlled from the brake valve. With straight pneumatic control only two connections are used, one for the air supply and the other for exhaust.

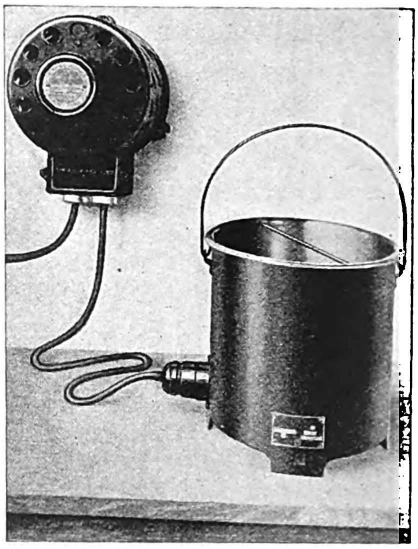
For the electro-pneumatic control, a new magnet valve or duplex valve, as it is termed by the manufacturer, has been designed in which a single valve controls both opening and closing of the door. The valve is energized to open and de-energized to close, so that an open circuit or ground ahead of the valve coil will close all doors. The single unit construction for the master valve simplifies wiring and piping connections and also results in considerable reduction of maintenance cost, as there are fewer parts to be inspected and looked after. For cars which are equipped with single folding doors and steps, or where selective control of doors is desired and where the work of the door engine is light, a smaller differential engine has been developed.



Improved Door Operator for Folding Doors and Steps

Glue Pot with Rheostatic Heat Control

TO RETAIN those qualities that give it maximum adhesiveness, glue must be carefully heated and handled. With the requirements of different temperatures to produce certain results has come a demand for a glue pot with heat control. The Westinghouse Electric & Manufacturing Company has brought out such a pot, which gives a wide range of heat control and at the same time keeps the unit simple and inexpensive. It also permits almost unlimited variation in the power input and in temperature.



Dry-Type Glue Pot with Rheostat for Heat Control

The unit is portable, as the rheostat can be laid on a bench or shelf or hung on a wall, while a flexible cable permits the glue pot being moved over a large radius, so that it may be placed at the best location, saving many steps to a central glue pot.

The dry-type glue pot is used with this new unit because of its many advantages over the wet type. Refilling of the water bath is eliminated and there is no danger of the pot boiling dry and burning out the heating element.

The casing and bottom plate of the pot are made of heavy sheet steel and the glue vessel of heavy spun copper. The glue vessel may be removed easily for cleaning.

The News of the Industry

Higher Fare Upheld

Superior Court Affirms Decision of Commission Authorizing Eight Cents in Philadelphia

Judge William H. Keller of the Superior Court handed down a decision on Dec. 5 affirming the temporary order of the Public Service Commission granting the Philadelphia Rapid Transit Company an increased rate of fare. The increase is from 7 cents, with four tickets for 25 cents, to 8 cents, with two tickets for 15 cents. The court ruled that the company had justified its request for an increased rate by concrete evidence and that the commission was wholly within its rights as defined by law in granting a temporary order. The ruling also upheld the $200,000,000 valuation of the commission, which had been disputed by the Governor and Attorney-General. They had contended that the valuation of $200,000,000 and upward was not an actual valuation and should not be so considered as a basis for rate making. The ruling also stated another principle, namely, that rate making was wholly a legislative function and that the commission acted only as an agent of the legislative branch.

FINAL ACTION AHEAD

The Public Service Commission will now take action toward a final ruling on the company's petition for an 8-cent cash fare. City Solicitor Gaffney has indicated that there were two courses which the city might now adopt—an appeal to the Supreme Court or an appeal to the Public Service Commission for another revaluation. The second proposal is under consideration by Milo R. Maltbie, a public utility expert, recently retained by the Governor to advise the commission on the necessity or wisdom of reopening the valuation of the company. Mr. Maltbie had been engaged after the Governor had sent a letter to the Public Service Commission intimating that it had been guilty of disregarding the public interest in increasing the fare. Following this communication the Attorney-General gave an opinion to the commission to the effect that no valuation of the company had been made in accordance with methods prescribed and along the lines specified by the Supreme Court.

The court asserted the commission was not required by law to fix a definite valuation of a public utility in determining rates. The fact that the commission found the company's property worth upward of $200,000,000 was sufficient, in the opinion of the court, to warrant its order increasing rates.

Applying this principle specifically to the case at issue, the court said:

> The only party hurt by the failure of the commission to fix the sum over and above $200,000,000 is the utility company, and if it does not complain the other party who has suffered no injury by this action cannot be heard to say that it is no finding at all.

The court ruled that the burden of proving that the proposed increase of rates was justified rested on the company, and the evidence was so substantial that no court could declare an order founded upon it to be illegal or grossly unreasonable.

The opinion went on to say that a finding based upon competent evidence sufficiently specific to pass the legal tests, that a company's property is valued at more than $200,000,000, was not to be cast aside as of no weight for any purpose because the commission did not find the exact amount by which the company's property exceeds that sum. It is the duty of the commission at all times to guard the interests of the public, but this is to be done in no spirit of partisanship or hostility to public service corporations. It is required to do justice to the corporation no less than to the public.

Judge Keller in affirming all the contentions of the commission did disagree on the wage-dividend fund. He said that the 10 per cent wage-dividend fund "is not a proper charge against operating expenses, but must be provided for, if at all, out of the company's fair returns on investment."

The statement said in conclusion that it found nothing in the commission's statement to complain of which required a reversion of its order, that the counsel merely emphasized what was inherent in the company's evidence, that is, the growing lack of sufficient revenue under the 7-cent fare and the hardship to the company of having to continue it during a protracted hearing. The assignments of errors were all overruled, the appeals were dismissed and the order of the commission was therefore affirmed.

COMPANY REVIEWS FARE CHANGES

In this connection it is interesting to note that Mitten Management in "Service Talks" for Dec. 4 refers to the "colossal mistake of the 7-cent fare." The company says:

> If the straight 5-cent fare had been granted in 1920, P. R. T. would each year have earned so much more than it did under the 7-cent fare that not only would the increase to 8-cent-cash-two tokens-for-15-cent fare have been unnecessary, but the straight 5-cent fare would still be sufficient for our needs. The folly of overriding the opinion of a successful operating management, as was done in this case. should have been apparent before the colossal mistake of the 7-cent fare was made.
>
> The 7-cent fare, in spite of our efforts, was forced upon this management in November, 1920. In 1921 P. R. T. carried 75,000,000 fewer riders than in the previous year—$3,750,000 worth of nickel fares. P. R. T. has never since reached the record riding of 5-cent fare days. The 7-cent fare results proved the engineers' estimate to have been wrong, while that which Mitten Management prophesied actually came true.

But, says "Service Talks":

> P. R. T. must continue the present fare to meet added operating costs and to support unprofitable extensions now in contemplation. P. R. T. can never re-establish the 5-cent fare with free transfers, since the city must depend upon P. R. T. to earn an ever-increasing sum to support city-built subways.

It is explained that the mounting costs which had everywhere else brought increased fares forced P. R. T. in 1920 to seek a means of increasing its revenue. Mitten Management recommended a straight 5-cent fare, with the elimination of all free transfers and 3-cent exchanges. The statement says:

> P. R. T. Bankers urged an increase to 7 cents, fearing the effect upon their interests elsewhere with P. R. T. proved continuously successful under a 5-cent fare.

Reference is also made to the fact that Mr. Mitten had "publicly declared that the 5-cent fare was 'almost a religion' of his."

Mr. Insull and Mayor Dever of Chicago Discuss Transit Responsibility

Samuel Insull and Mayor Dever of Chicago engaged in an impromptu but spirited debate at the annual dinner of the Chicago Real Estate Board on Dec. 4 over the negotiations and projects for more rapid transit in Chicago. Mr. Insull, who has offered to build a subway to carry his elevated trains under the Loop district, told the Mayor in a public address to "say it with shovels" if the city intends to use its $40,000,000 traction fund to dig a tube. Mr. Insull said that Chicago is being stifled by lack of transportation, because the city does nothing and won't let others do anything.

Mayor Dever retorted that the elevated lines had ignored franchise grants made years ago to give Chicago a rapid transit system and had gone out into a cow pasture with a recently inaugurated extension to the town of Niles Center, west of Evanston, instead of spending the money inside the city.

The Mayor said later that a referendum on using the $40,000,000 for a subway or as the foundation for a $400,000,000 financial structure to coordinate the lines was certain in February.

More Study of Subway Plans Recommended at Boston

A report has been filed for the Massachusetts Legislature by the Boston Transit Commission and Public Utilities Department, which have been sitting jointly as a recess commission to study the problems of the future extensions of the rapid transit system in Boston. The report discusses extension of the East Boston Tunnel from Bowdoin square, under Green Street and Staniford Street, joining the present elevated at Causeway and Lowell Street, near North Station, at a cost of

$1,500,000; also extending the East Boston end of the tunnel about 1 mile at a cost of $4,000,000.

Another proposition outlined in the report is the removal of the subway incline in Cambridge Street, extension of the East Boston tunnel to run under Cambridge and Charles Street, with a station in Charles Street to connect with the present Cambridge subway to Park Street. This work would cost $2,500,000. If it were carried out another important transfer point would be established which would relieve Park Street.

In connection with this report the commission recommends that nothing be done at present, because the two permanent projects referred to have not had sufficient study.

Buffalo Council Against One-Man Cars

Despite the opinion of the city law department that the ordinances are unlawful, the City Council of Buffalo has enacted two measures in its movement to prohibit the operation of one-man cars on all local lines of the International Railway. "Within 24 hours after the ordinances were enacted motorcycle police arrested eight operators of one-man cars on a charge of speeding. The test cases will be tried out in City Court. The car operators, through counsel for the railway, entered pleas of not guilty and their trials will be held late in the month. The basis of the action by the city against the operators who were arrested is that they were running their cars in excess of 6 m.p.h., the speed limit fixed in one of the recently enacted measures.

Interurban Terminal at Akron Being Used by Bus Patrons

Cement has been laid between the first two tracks in the trainshed at the terminal of the Northern Ohio Traction & Light Company in Akron and a union bus terminal established. Bus lines using the terminal are the Cleveland-Akron Bus Company, Northern Transit Company, Akron-Youngstown-P.O. Electric Company, Akron-Canton Trackless Coach Company, Akron-Medina-Elyria Line, and Akron-Wooster Line.

This union terminal is proving a great convenience to passengers who desire to transfer from one line to another or from a bus line to an interurban railway line. The terminal facilities at Akron are unusually complete, the station there being one of the finest of its kind in the United States.

Buses enter the trainshed on the south side of the terminal building, and leave from the north. When the union motor coach station was opened the "tunnel" through which passengers went to interurban cars was temporarily abandoned. It will be used only on special occasions. Walks have been laid across the tracks and passengers go directly through the gates to their cars.

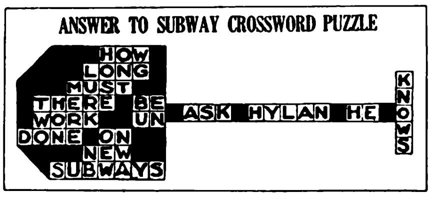
A new union time card has been issued containing the timetables of all lines entering and leaving the terminal.

Hylan's Subway Plan to Cost $400,000,000

Four Boroughs Included in Project—Manhattan to Have Trunk Line—Brooklyn and Queens Also

Mayor Hylan's municipal subway plan was made public by his Board of Transportation today. The principal feature of his project is a new Manhattan trunk subway from the lower end of his island to Mayor Hylan's 193d Street. There are also tentative plans for a Hylan Brooklyn-Queens line and connections under his East River with his new route in his Manhattan. His four boroughs are included in the general plan, which contemplates a subway beneath his Grand Concourse in the Bronx.

This is the lead, slightly amended, which the *Sun* carried on the story published in the issue of Dec. 9 about Mayor Hylan's new proposal. The only part of the plan actually adopted by the Board of Transportation on Dec. 9 dealt with the lower portion of the new Manhattan trunk line, the upper part of this route having long since been approved by the Board of Estimate. The upper portion, from 64th Street and Central Park West to 193d Street and Overlook Terrace, was laid out by the Transit Commission a long time ago and formally adopted by the Estimate Board in August, 1923.



New York "World" Pokes Fun at Hylan

The money to build it has never been appropriated by the city authorities and the plan has marked time since. The plan just announced reveals that a substantial part of the Hylan project in Manhattan is virtually identical with Transit Commission routes.

Together with the lower section which was adopted by the Transportation Board, the new Manhattan trunk line will start either at Fulton or Wall Street and East River running to Church Street, to Greenwich Avenue, to Sixth and Eighth Avenues, to 53d Street, then under Central Park West, St. Nicholas Avenue, to Broadway and Fort Washington Avenue to 193d Street and Overlook Terrace. The line will cost about $167,500,000 to build. The route mileage will be 16.65.

The Brookyln-Queens portion of the new underground system is to have a crosstown route similar to that proposed by the Transit Commission, and in part approved by the Board of Estimate in August, 1923. The new project as tentatively mapped out calls for a crosstown subway, the lower end joining with the Brooklyn Manhattan Transit Company Culver line which the city intends to recapture and the upper end running into Long Island City, connecting with the 53d Street tube and then proceeding far into suburban Queens.

The Brooklyn-Queens part of the system was not formally put before the Estimate Board at this time, but its general layout was indicated by the map made public by the Board of Transportation tracing the project in the three boroughs.

The entire system will cost approximately $400,000,000.

Supreme Court Justice McAvoy, who has been commissioned to inquire into the transit situation, will begin the inquiry on Monday morning, Dec. 15, at 10:30 o'clock in the rooms of the Bar Association, 42 West Forty-fourth Street, New York. Announcement has been made that Henry L. Sherman will be counsel for Judge McAvoy in connection with the inquiry. Mr. Sherman is a member of the law firm of Hirsch, Sherman & Limburg. He was graduated from Yale and is considered a lawyer of rare ability and astuteness.

Max D. Steuer has been retained as special counsel for the city in the transit investigation. Former Supreme Court Justice Clarence J. Shearn, who has been special counsel to the commission, has been advising the members of the commission and will continue to act as special counsel during the progress of the inquiry.

Elaborates Boston Plan

Mayor Curley of Boston on Dec. 4 submitted a brief embodying his views on the desirability of turning over the entire electric railway service of the metropolitan district, within a radius of 15 miles of Boston, to a board to be known as the Metropolitan Transportation District Commission. This supplemented remarks made by him previously before the joint legislative committee investigating the Boston Elevated Railway.

The Mayor said that if adequate street railway transportation was recognized as an absolute essential in the metropolitan district there could be no valid objection to the operation of such system by a Metropolitan Transportation District Commission with authority to fix fares and arrange financing.

Personally, the Mayor believes that a 5-cent fare locally in each city and town of the metropolitan district with a graduated fare on the high-speed lines sufficient to cover fixed charges and higher operating expenses is equitable and should prove profitable. In the event that the Metropolitan Transportation District Commission should in any year encounter a deficit he favors an assessment upon such portions of the metropolitan district as are served by the railroad upon the basis of population and valuation.

As the Mayor sees it, adequate transportation is as essential as water, sewerage and public parks. He says there is a menace not only to the large retail and manufacturing establishments in the cities and towns of the metropolitan district, but there is in addition that which constitutes confiscation of the dividends of a lifetime of toil and thrift on the part of the worker who awakens to find that the railway which transfers him from his home to the place where he earns his livelihood has been abandoned because it did not prove a profitable investment for the owners.

Bus Applications Denied by New York Commission

The Public Service Commission on Dec. 5 denied the application of James W. Dillon and Homer R. Peacock for a certificate for the operation of a bus route between Syracuse and Wolcott. The evidence showed that the proposed bus line would compete with the Empire State Railroad Corporation, the Lehigh Valley, the Rochester & Syracuse Electric Railroad and the New York Central, and with bus lines operated by George T. Wood and Vernon Waterhouse.

The commission also denied a petition by James W. Dillon to operate a bus line between Syracuse and Borodino. It was shown that this proposed line would compete with the Auburn & Syracuse Electric Railroad and that the communities were well served by the electric railway. The Marcellus village and town authorities opposing the granting of a certificate to Mr. Dillon.

Considers Suspension of Service Order for Schenectady

A hearing was held before Public Service Commissioner Van Voorhis at Albany, Dec. 3, on the petition of the Schenectady Railway, Schenectady, N. Y., filed on July 30, to be relieved from complete compliance with the order of the commission of April 4 1923, which directed the purchase of certain additional equipment for local and interurban service. The order of the commission was the result of hearings held on complaint of patrons of the railway and the Mayor of the city of Schenectady.

At the recent hearing, the attorney for the railway stated that the Mayor of Schenectady and the Corporation Counsel were agreeable to a suspension of the order, as practically all of its terms had been complied with. The order of the commission directed the purchase of twelve new city cars, of which ten have been purchased, while the company has provided three of the six new cars directed for interurban use. Other snow removal equipment and increased facilities have been provided and the company is doing everything possible to meet the needs of the public.

An inspection of the property of the company will be made by the engineer of the commission, and if his report is satisfactory the commission will issue an order in accordance with the application of the company.

Arguments Heard on Taxing Seattle-Owned Utilities

Before the Seattle Municipal League members, the proposed plan to require city-owned utilities to pay a 5 per cent gross earnings tax into the general fund was recently debated by Councilman W. T. Campbell, backer of the proposed measure, and Oliver T. Erickson, former Councilman and supporter of municipal ownership. Councilman Campbell argued that city-owned utilities are participating in the benefits of other city departments without contributing to their support. He also argued that requiring the utilities to bear directly part of the cost of government would result in increased business that would more than make up for the tax.

Mr. Erickson replied that handicapping the municipal utilities with a 5 per cent gross earnings tax was a queer way to show belief in public ownership, and characterized the ordinance as a measure to penalize residents of Seattle for their loyalty in supporting the city-owned water and light plants and street railway.

Tunnel Suggested

Combination Tube and Subway Plan to Connect San Francisco and Alameda Shore Advanced by A. J. Rich

A bridge across San Francisco Bay will soon be a reality. Work on the structure is scheduled to start by March 5 next. A permit from the United States War Department for this project is now in the hands of Col. Frank E. Webb, representing a company which is to build the bridge. Colonel Webb also announces that his concern has raised sufficient funds and is ready to start work. The span will cost about $7,000,000 and be 7 miles long, including the approaches. The terminals, according to tentative plans, will be at San Mateo on the San Francisco side and at a point opposite Hayward on the East Bay shore.

The Webb interests have been granted a 50-year franchise by San Mateo County on condition that at the end of that time the property revert to the state of California. So far no franchise has been issued by the Alameda County Board of Supervisors.

There are many plans which it is claimed will improve traffic, but one of those that is given most serious thought is the plan of A. J. Rich of San Francisco for a combination tube and subway to connect San Francisco and the Alameda shore.

The Key System Transit Company, on the other hand, handles local traffic almost entirely. It charges, as does its rival, an 18-cent fare for the ferry trip, with a monthly commutation rate of $4.50.

The project calls for an expenditure of $60,000,000 to be raised privately. Mr. Rich says that he and his associates have been working on the scheme for the past three years.

The Rich plans call for a bridge and underground tube between Hunter's Point on the San Francisco side to a point opposite on the Alameda shore. Here the bay narrows, thus offering an easier engineering problem than the Goat Island plan, which has been the popular one heretofore.

Oakland occupies a position in relation to San Francisco similar to that which Staten Island does to New York. There is no municipal ferry at Oakland, but there are two ferries, one operated by the Southern Pacific Railroad and the other by the Key System Transit. A large portion of the Southern Pacific ferry traffic consists of passengers discharged from overland trains which have their terminus in the Oakland Mole.

Physical Culturist Has Subway Idea

Bernarr Macfadden, physical culturist, newspaper owner and hiker, who is reported to walk from his country home in Nyack, N. Y., to his office in New York City every week day in order to stretch his own legs, has evolved a plan for solving New York's transit problem. He has worked out the idea of a double-deck subway car and has offered to form a company to build a model vehicle of this kind.

This idea he has exploited with a great deal of gusto through his own New York *Evening Graphic*, a picture paper which discusses editorially such a comedy as "Marriage As It Should Be," written and signed by Mr. Macfadden. Mayor Hylan, accommodating soul that he is, says he will commend the project if it proves of practical value. Mr. Dahl of the Brooklyn Manhattan Transit Company says to Mr. Mcfadden that the B.-M.T. has adopted the policy of considering on its merits any suggestion intended to improve transit conditions. As *Graphic* is supposed to live up to its title illustrations drawn by imaginative artists have been used to adorn the story which the paper has been running. One of these depicts riders in one of Mr. Macfadden's cars apparently forgetting their transit troubles while devouring the *Graphic* or *Physical Culture Magazine*, another Macfadden publication.

Court Restrains Kansas City Jitneys

Judge Van Valkenburg in the federal court at Kansas City, Mo., on Dec. 2 issued an injunction against the operation of either interstate or intrastate buses carrying local or other passengers in Kansas City, Mo. This development was of extraordinary interest because the railway receivers had previously filed with Judge Stone a report recommending operation of buses by the railway, contingent for one thing on the elimination of competition. The injunction was filed at 3:40 p.m. The bus company had been operating since Jan. 1 under various managements. It suspended operations at once.

The order was directed specifically against F. B. Miller, R. E. Ahlvin, Hiram H. Moore and P. R. Guthrie, who took over the interstate line between Kansas City, Mo., and Kansas City, Kan., and the crosstown bus lines in Kansas a few months ago. The order is based on the "jitney" ordinances of Kansas City, Mo., passed by Council on March 22, 1921, and July 13, 1921.

A section of the order prohibits operations of buses, which the court says come within the description of jitneys in the ordinance, on any streets unless all the provisions of the ordinance with regard to consent of owners residing in Kansas City of a majority of abutting frontage on designated routes. The order also specifically prohibits operation on streets having street car lines, as being contrary to the ordinances mentioned.

New Ordinance Proposed for Cincinnati System

Elimination of the present service-at-cost street car franchise for the Cincinnati Traction Company is provided in an ordinance initiated by the Citizens' Committee, headed by Eli Frankenstein and William J. Schultz, attorneys. A copy of the ordinance, together with formal notice that the committee proposed to circulate petitions for a referendum election on it, has been filed with the city auditor of Cincinnati.

The outstanding feature of the proposed measure, which would repeal all former ordinances, is that it provides a flat 7-cent rate of fare. It also provides that tickets are to be sold in strips of two. The rate of fare for children is fixed at 3½ cents. A universal transfer system without extra charge is provided. The ordinance gives the director of public service control of service.

The ordinance is a 25-year franchise and provides for revision at the end of each 5 years. The measure almost entirely eliminates the office of director of street railroads, confining his duties to the gathering of data for the information of the service director and City Council. The proposed measure eliminates the $350,000 annual franchise tax.

Mr. Frankenstein says that filing of the petition blocks all further negotiations with the city, the officials of the traction company and the Cincinnati Street Railway leading to a new franchise.

Traction Man a Government Beneficiary

An humble railway servant became a national figure on Dec. 6, when the United States government initiated him *ex cathedra* into the taxpayers' refund fraternity. His associates included financiers, business magnates and even Julia Marlowe, herself. They all received a substantial return for Uncle Sam's gouging practices, but the utility man, as tradition demands, graciously accepted an award of 1 cent. Burr Martin, vice-president and general manager of the Texas Electric Railway, Dallas, Tex., may use this contribution toward his rehabilitation program for 1925. At any rate, he can comfort himself he didn't get the worst of the game —many got nothing.

Bus Lines Compete with Toronto Municipal Railway

Operation of bus lines from the city of Toronto, Ont., to adjacent municipalities is a new problem which is causing executives of the Toronto Transportation Commission considerable trouble. The Toronto *Globe* explains that as the law stands at present, buses operating from one municipality to another cannot be controlled or suppressed by either municipality. Consequently, there is nothing to prevent private companies operating buses in all the outlying sections, thus robbing the T.T.C. of revenue on the parts of its system which at present are the least profitable. If buses are to be allowed to operate on the Weston Road, York Township and Weston will likely give up the idea of taking over the suburban radial, as it would be almost impossible to make the line pay against competing buses operated only at the profitable periods. It is probable that the question will be brought before the Legislature at the next session in order that the act may be so changed as to permit the regulation of interurban bus transportation.

Labor Reiterates the Doctrine of Resistance

Samuel Gompers chose the occasion of his election to the office of president of the American Federation of Labor for the forty-fourth time to announce the following policy:

> An industry that cannot pay a living wage according to our American standards of civilization had best get out of business. The American labor movement has adopted a slogan: "It is better to resist and lose than not to resist at all." Let it be clearly understood, come what may, be the result what it may, the American workers will resist any attempts to cut wages, no matter what the result be to industry.

Another Warning to Careless Motorists

In order to arouse Milwaukee, Wis., motorists to a sense of watchfulness in approaching and crossing street intersections, a local newspaper started a safety campaign in which it has had the full co-operation of the Milwaukee Electric Railway & Light Company. The accompanying picture shows the part taken by the railway company in its efforts successfully to put over this safety drive. It changed one of its work cars to a moving advertisement by mounting on it a badly wrecked automobile with appropriate accident signs. The car traveled through the streets of the city during the campaign as a constant reminder to the motorist in the city and in outlying territories to be more careful on the streets, especially when approaching intersections where electric and steam line tracks are crossed. The compilation of figure by the Safety Commission shows a big increase in the number of accidents at street intersections which involved motor vehicles.

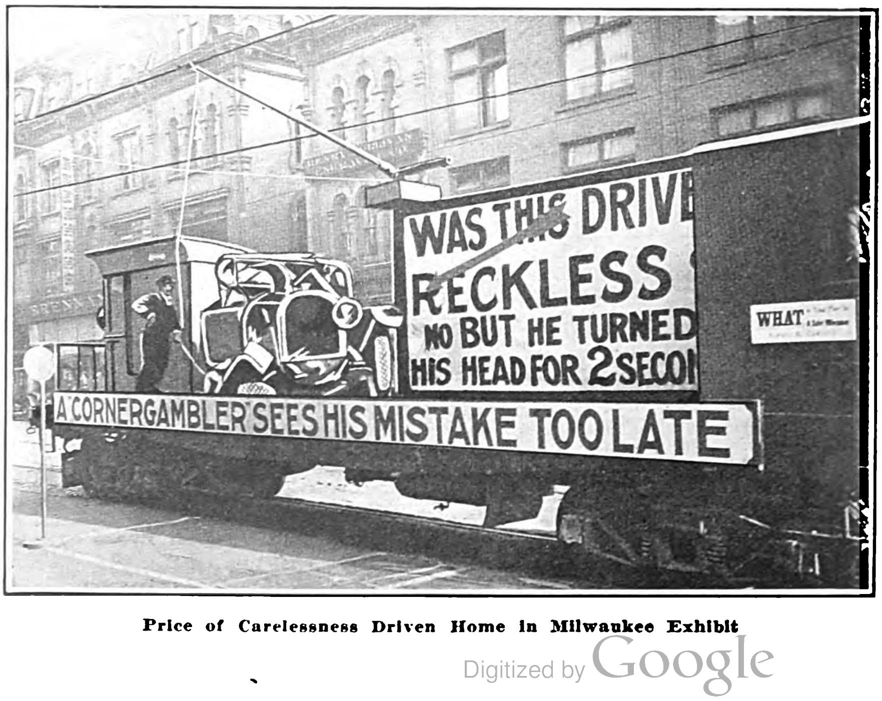
Bus Regulation Taking Form in Massachusetts

Rigid regulations for the operation of buses in Massachusetts are growing out of the joint jurisdiction of the Public Utilities Department and the city and town authorities vested with power to issue or withhold licenses. The latest chapter comes from a settlement of a controversy in Northampton where the Northampton Street Railway appealed from rules that had been promulgated by the City Council. The Public Utilities Department has refused to rule against aliens as owners of bus lines.

The department also rules that motor vehicles used exclusively for sightseeing purposes or for carrying guests to and from hotels are not exempt from regulation by the city authorities. Under the department's ruling also licenses from the Northampton City Council will be required for the operation of motor vehicles in that city.

One important regulation promulgated requires that every licensee shall operate for 9 or more hours daily, unless accident or unavoidable cause prevents such operation, and the minimum period of operation shall be fixed by the City Council in the case of each permit granted. On routes using the same terminals as are used by electric railways, not less than 12 hours daily operation is required by the Council unless avoidable cause prevents.

To Test Regulation of Bus Rates.—In an effort to define the extent of control by municipalities and the Michigan Public Utilities Commission over interurban buses, the Michigan Highway Transportation Association will seek a court ruling on legality of the new Lansing city ordinance regulating rates of interurban buses in that city. A temporary injunction is expected to be asked, as the ordinance takes effect Christmas Day. Bus operators claim the ordinance favors a competing company, the Michigan Electric Railway. They hold that cities do not have such regulatory powers, except to afford protection to the public and that control rests with the state commission.



Price of Carelessness Driven Home in Milwaukee Exhibit

Strike Over

Tentative Agreement Between Company and Men Reached in Southern and Central Illinois

Employees of the Illinois Traction System (McKinley lines), on strike since Dec. 7, were expected to return following a tentative agreement between the men and officials at a conference in Springfield on Dec. 11. The agreement, which was to be submitted to various local unions on Dec. 12, covers the question of the closed shop, overtime pay and arbitration of wages.

The tie-up of passenger and freight service occurred within six hours after officials of the system claimed they were advised the strike would be called. The company is said to have been unwilling to meet the demands of the men for an advance in wages of 10 cents an hour, time and one-half for overtime and closed shop conditions. Under the old wage contract, which expired on Dec. 1, brakemen were getting 50 cents, passenger motormen and conductors 62½ cents and freight crews 65 cents.

More than 100 towns and villages in southern and central Illinois were affected by the strike. Out of the system's total mileage of 500 miles approximately 400 miles were involved. Trains continued to operate between St. Louis and Granite City, Ill., over the St. Louis Electric Terminal Railway, a subsidiary, and on the Joliet-Princeton division, the workers on those divisions having separate wage contracts with the railway.

The strike did not affect local properties in Peoria, Bloomington, Decatur and Danville, where wages were recently decreased by an arbitration board.

D. W. Snyder, vice-president, at Springfield, Ill., issued a statement in which he asserted the strikers' committee of five had dealt unfairly with the company and the public by giving only six hours' notice of the intention to strike. Tildon E. Goddard of St. Louis, a member of the committee, denied this charge. Mr. Goddard stated the workers were polled on the question of striking, the vote being 267 for and 18 against.

Following conferences between officials of the company and the strikers on Dec. 8. A. McGuire, international representative of the union, declared the men were willing to waive their demands for an increase of 10 cents an hour if the company would grant overtime of time and one-half for more than ten hours' work. However, this proposal was not put up to officials of the railway.

Vice-president Snyder said it would be financial suicide for the company to submit to the demands for increased wages, pointing out that since the last wage agreement was reached the income of the system had shown large losses instead of gains as was expected.

No attempt was made by the company on Dec. 8 or 9 to move cars over the system, but much of the inconvenience incident to a strike of this kind was removed by automobile trucks and buses, as many of the towns along the traction system are situated on hard roads. Steam railroads took care of the mail contracts of the system.

The propositions submitted by the company to the men follow:

> "1. That the committee of five should have authority from the rank and file of our men to negotiate a new agreement; that pending such negotiations an agreement should be made continuing the last contract (except as to wages) until a new agreement should be made; that the wages finally agreed to should be retroactive to Dec. 1, 1924.
>
> "2. While this company, in its efforts to continue railway service in its territory, has urgent need for reduced expenses and believes a new contract should carry with it lower costs, we are willing to co-operate to the extent of agreeing to the renewal of the recently expired contract for a period of from three to six months. This was later extended by the company to a full year.
>
> "3. Believing that our position is fair and one that will stand honest examination, we proposed that the committee and the company enter into an agreement to submit the entire matter to arbitration, as arranged for in our last contract."

Maryland Railway Outlines Extensive Bus Program

R. Paul Smith, secretary of the Blue Ridge Transportation Company, has filed a schedule with the Public Service Commission of Maryland covering 18 interstate and intrastate lines utilizing Maryland highways. At the same time Mr. Smith has pointed out that the Maryland roads constitute only a small part of the highway mileage planned for use. The company has already absorbed independently operated lines in the Baltimore-Frederick and Washington-Frederick districts and has signified its intention of acquiring through purchase the permits of other small, independent operators in other districts.

The application is regarded as of particular interest as indicating the first step in a comprehensive plan for the more intensive use of the bus by the Potomac Public Service Company, of which Mr. Smith is general manager. That company, through its various subsidiaries, now controls 91 miles of electric railway, operated mostly from Frederick, Md., as a center.

Final Arguments Heard on Interstate Bus Case

An early decision is expected from the United States Supreme Court in cases involving the degree of authority that States may exercise over interstate traffic over public highways.

The appeal of Buck vs. Kuykendal was argued before the court on Nov. 25. This involves not only the primary question of interstate control, but the added factor of state control over a federal-aid highway connecting two or more States. Buck was refused a permit in Oregon to operate an interstate bus line for through business only between points in Oregon and points in Washington. The lower courts upheld the state commissioner.

The appeal of the Michigan Public Service Commission against the Duke Cartage Company was presented the court two days before the Buck case. This involves state regulation of traffic over an interstate highway not built with the assistance of federal-aid funds.

Counsel were asked a number of questions by the justices in order to bring out points which struck the court as of especial importance in the issues.

News Notes

Baltimore Employees Receive 2 per Cent Increase—Shopmen and trainmen of the United Railways & Electric Company, Baltimore, Md., in the annual conference of various classes of workers with President Emmons, were granted a 2 per cent increase in wages. The advance, affecting 5,000 men, will be effective Jan. 1, 1925. As a result minimum wages of shopmen will be 47 cents instead of 46 cents an hour and trainmen's wages will be 52 cents an hour instead of 51 cents.

Seeks Bus Permit.—The Portland Electric Power Company, Portland, Ore., has applied to the City Council for a franchise to operate a bus line in the St. Johns district, to supplement the present car service. The application provides for a 10-cent initial fare, with such changes as are required by cost of operation determined from time to time. The application also provides that the company shall pay to the city $100 as an annual fee and $1 a seat a quarter for all buses regularly operated. Thirty-minute service will be furnished.

Free Rides Mark Reopening of Road.—As part of its program to make restored service in Kewanee, Ill., a success the Kewanee Public Service Company invited residents of the city to ride free on the cars on Nov. 29, the day service was resumed. In an effort to popularize the service, the $1 weekly pass has been instituted. The restoration of service by the property, at one time under the management of the Galesburg & Kewanee Electric Railway, was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 6.

One-Man Cars in Service.—Five one-man cars were in operation, on Dec. 8, on the lines of the Springfield Railway, Springfield, Ohio. Others will be placed in service in the near future.

Bill Would Limit Parking.—A bill is before the Mayor of Louisville, Ky., which will prohibit parking of autos on Fourth Avenue, Louisville, between 6:30 and 9 a.m., and 4:45 and 6 p.m. This plan is expected to speed up traffic materially, especially during the evening rush hours. It will not affect parking during shopping hours to any extent.

Use of Tokens Increased.—Since early in September, 1923, the Johnstown Traction Company, Johnstown, Pa., has been operating at a rate of four tokens for 30 cents and 10 cents cash instead of the former 7-cent cash and ticket rate. As a result of the present differential between the cash and token rates the use of tokens has increased to a point where now about 98 per cent of all revenue passengers use tokens.

"Feeder" Lines Start.—The Indianapolis Street Railway, has begun the operation of "feeder" buses in two districts of Indianapolis, Ind., where the car lines have not been extended as fast as the residence district built up. Preparatory to establishing the service, the company officials entertained 50 city officials making a trial trip in two of the buses. Robert I. Todd, president of the company, presided. It is the company's intention to place buses in operation at the ends of other street car lines.

Bus Measure Proposed for Georgia.—It appears practically certain that the next Legislature of Georgia will be called upon to consider several motor bus franchise bills and it is predicted that some measure of this nature will be passed to equalize the road maintenance taxes.

Hearings on Bus Fares Will Be Resumed.—Hearings will be resumed on Dec. 19 before the Michigan Public Utilities Commission on the petition of the Detroit United Railway to increase its bus fares between Detroit and Mount Clemens and Detroit and Pontiac. The decision in favor of a temporary increase was reached when the hearing was resumed on Nov. 29 and higher fares became effective Dec. 1. This increase to 1½ cents a mile was referred to in the ELECTRIC RAILWAY JOURNAL of Dec. 6. The 2-cents-a-mile rate which was to be put into effect by the Detroit United Railway on Dec. 17 has been suspended pending the commission's investigation. The 1½-cent rate superseded the former 1-cent-a-mile rate.

Subway Movement to Be Pushed.—The Civic Council on Rapid Transit, a citizens' committee to sponsor the movement for a subway and rapid transit for St. Louis, Mo., has been organized by representatives of fifteen civic and business organizations of the city. Orman J. McCawley, chairman of the Rapid Transit Committee of the Civitan Club, which began the subway movement last spring, has been named chairman. A committee of Aldermen has recommended an expenditure of $100,000,000 for a subway system in the downtown district, the bonds to be paid off over a period of 50 years from the revenue from the subway.

Seeks Higher Fare.—The Beloit Traction Company, Beloit, Wis., has petitioned the Wisconsin Railroad Commission to increase its fares from 5 cents to 7 cents and from 4 to 6 cents where tickets are involved. No increase, however, is asked in the present 2-cent fare the school children of the city are obliged to pay. Last year the system was able to earn a return of only 2 per cent on the investment.

Breaks Into Print on Fifth Anniversary.—"Ore Line News," published by the employees of the Northeast Oklahoma Railroad, Miami, Okla., made its first appearance under date of December "as a medium of exchange of ideas of benefit to each other and for distribution to the public of information thought to be of interest." The initial number recounts interesting events in the company's departments, camp and hospital associations, together with some traffic and track statistics of the company during its five years of operation.

Franchise Rights Extended.—The Southwestern Traction Company has retained its franchise rights to operate on the streets of Dallas if it builds an interurban line to Irving by Aug. 31, 1925, the City Commission decided recently. The ordinance renews many of the rights granted in 1906 to J. Mercer Carter and associates when a system not only to Irving, but to Cleburne and other points in Central Texas was contemplated. The franchises have passed to E. P. Turner and associates, now known as the Southwestern Traction Company. Under the franchise granted Dec. 1 the Southwestern Traction Company has the right to lay its own tracks west of Houston Street and to go over the Union Terminal tracks and the Trinity River with a viaduct of its own. The company cannot lay tracks on the Commerce Street bridge. As a bonus for the franchise Mr. Turner and associates are to pay the city $100 a year. The franchise runs for a period of twenty years.

Fare Proposals Submitted.—Negotiations between the Council of Quincy, Ill., and the Illinois Power & Light Corporation, operating the Quincy traction system, are proceeding on two fare proposals recently submitted by Ralph Carley, western division manager. A 10-cent cash fare, 7 checks for 50 cents or a monthly commutation ticket at 50 cents to reduce the fare for frequent users is the first plan, with four checks for 25 cents and a cash fare of 10 cents as the alternative. School children's fares remain at 5 cents in both plans.

Rates Approved.—The Public Service Commission has approved rates for the Syracuse Railway Co-ordinated Bus Lines, Inc., on its new line known as Colvin Street Bus Line, operated in city of Syracuse, N. Y. A fare of 7 cents per capita or valid transfer issued by New York State Railways will apply for transportation of adult passengers between any two points on the bus lines.

Prefers Lower Fare with Loss of Line.—The 5-cent fare with free transfers will remain in effect on the local lines of the International Railway in Niagara Falls, N. Y., under a decision of the Public Service Commission. The company is, however, authorized to abandon its Sugar Street line because receipts do not meet operating expenses. The line is 2 miles long and covers the northeast section of the city. The commission gave the city of Niagara Falls the option of allowing the International to continue the Sugar Street line at an increase in fare on all lines or abondoning this one line and keeping the fare undisturbed. The city accepted the abandonment plan. It is expected that the company will now proceed with the work of removing the tracks and poles.

Foreign News

Royal Commission Inspecting the Tramways in Australia

A Royal commission of experts is investigating the railways and tramways of Australia and New Zealand. The commission consists of Sir Sam Fay and Sir Vincent Raven, with Charles Travis, as secretary, all of London. Sir Sam Fay was for 20 years general manager of the Great Central Railway and during the latter part of the war held the important position of director-general of movements of railways at the War Office. He was president of the Institute of Transport for the year 1922-23 and is a director of the Buenos Aires Western and Buenos Aires Great Southern Railways. Sir Vincent Raven was chief mechanical engineer to the North Eastern Railways for a period of 12 years and during the early part of the war was chief superintendent of the arsenal factories at Woolwich, and later became controller of the armament production at the Admiralty. Mr. Travis is associate editor of the British *Railway Gazette* and editor of the *Railway Engineer*.

Swiss Railway Development Plans for 1925

The budget of the Swiss Federal Railways, Berne, Switzerland, for 1925 provides for the expenditure of 51,433,140 francs for electrification work, 25,060,000 francs for additional electric locomotives and motor coaches and 2,000,000 francs for installation of electric heating appliances in the passenger rolling stock. Included in the proposed work is a new line making direct connection between the Havenstein line and the Aara line, for which 1,190,000 francs was appropriated. New estimates are to be prepared for a new line in the Surbtal district. This line was first proposed in 1920.

There are at present 382 miles of electrified lines of the Swiss Federal Railways and work will soon be completed on the Zurich-Olden line, 40 miles; the Olsten-Berne section, 37½ miles; the Zurich-Winterthur line via Wallisellen and Kloten, 25½ miles; the Zurich-Rapperswill line, 22½ miles; the Lausanne-Vallorbe-Yverdon line, 40 miles, and the Palezieux-Lausanne and Renens-Geneva sections, 45½ miles.

A contract has been made with the Bernische Kraftwerk Gesellschaft for the supply of current for the lines already electrified and those to be electrified. The contract is for 20 years and will mean a saving of 11 per cent over the present cost of current. Plans were approved for the construction of substations at Kersers, Rupperswil and Rudoux, 9,615,000 francs having been appropriated for the work.

The Swiss Federal Railways now has in use 227 single-phase electric locomotives and motor coaches, exclusive of those on the Seethal line. It is thought that 304 will be required by the end of 1926.

L. C. C. to Use Sorbitic Rails.—The London County Council has arranged for 200 tons of tramway rails to be treated by the Sandberg sorbitic process, at a cost not to exceed £360. This process has been extensively used in Great Britain with great success. A description of the use of sorbitic rails in Boston was published in this paper for July 26, 1924.

Financial and Corporate

Final Moves Being Made

Reorganization Plan for St. Louis System Enters Upon the Final Stages Before Court and Commission

The reorganization plan for the United Railways, St. Louis, Mo., will be presented informally to the Missouri Public Service Commission in the near future for approval. The plan has already been submitted to Federal Judge Faris for his information and informal approval. This was disclosed recently when the court denied a group of attorneys representing holders of judgments against the United Railways the right to intervene in the foreclosure action against the railway. The court took this position when counsel gave assurance that all of the judgments against the company were to be in full with interest in the reorganization plan. Judge Faris stated that the move was premature and that when the time came for such action the petition could be filed.

The court will be asked to decide whether the reorganization committee must pay off the $4,100,000 of underlying bonds to cure the default in the $30,300,000 issue of general 4 per cent bonds of the United Railways or extend the underlying bonds. This phase of the reorganization is the only one that has not been finally agreed upon. The tentative plans call for the paying off of the underlying bonds at this time, but if the court holds that the bond can be extended it would furnish the reorganization committee that much more working capital at this time.

$14,195,512 IN CASH

Attorneys for the reorganization committee have advised that the underlying bonds may be extended legally, but attorneys for the bondholders' committee have taken the position that the bonds must be paid off to cure the default in the general bond issue which occurred when the company was unable to take up the underlying bonds at their original maturity dates.

The reorganized company will raise funds through the issuance of $6,000,000 in new bonds to be sold at 90, thus netting $5,400,000, and through the sale of 343,645 shares of common stock to present holders of preferred stock, transit bonds and common stock at $12.50 a share, netting $4,295,562. It is expected that the cash in the hands of Receiver Rolla Wells will be $4,500,000 when the receivership terminates. This would give the new company a total of $14,195,512 cash, which could be used to pay off the $4,200,000 in receiver's certificates, $2,000,000 Suburban bonds and possibly the $4,100,000 of underlying bonds.

It is planned to ask the Missouri Public Service Commission for authority to earn 7 per cent on a valuation of $57,200,000, or $4,004,000. That would enable the company to meet all of its fixed charges and begin immediately to pay dividends on the preferred, with a remainder left over to apply to the common stock.

The plan for the reorganization of the United Railways, St. Louis, Mo., to which reference has been made in recent issues of the ELECTRIC RAILWAY JOURNAL, contemplates the organization of two companies to succeed to all the properties of the system, one of which, for the present, is termed the new company, and the other, the new Suburban subsidiary. The new company is to issue $6,000,000 of new collateral notes or first and refunding mortgage bonds, probably bearing interest at 6½ per cent; 53,845 shares, probably no par value, $7 dividend cumulative preferred stock and 343,645 shares of no par value common stock. The new Suburban company will issue $4,500,000 first mortgage 5 per cent bonds.

NEW BONDS AND STOCKS TO BE SOLD

Of these securities, $6,000,000 new company bonds are to be sold at about 90 and the 343,645 shares of new, common stock are to be disposed of at $12.50 per share. It is estimated that treasury cash will amount to about $4,500,000, so that a total of about $14,195,562 cash will be available for the purposes of the plan. This money is to be used in the payment of the receiver's certificates, for the retirement of $1,640,000 Cass Avenue & Fair Grounds Railway first 5 per cent bonds, $986,000 Compton Heights, Union Depot & Merchants' Terminal Railroad first 6s and $1,474,000 Lindell Railway first 5s, now 8 per cents, all at par. These issues matured by their terms during the receivership.

There will also be funds for the payment at par of $2,000,000 St. Louis & Suburban Railway first mortgage 5s, now 8s, and for payment on account of $2,937,000 in respect to $9,790,000 now outstanding St. Louis Transit Company improvement bonds, due Oct. 1 of this year. After these payments have been provided for it is expected that nearly $900,000 will remain for the expenses of the reorganization and working capital for the new company. The $4.500,000 of bonds of the new Suburban company are to be issued in exchange, par for par, for St. Louis Suburban Company general mortgage 5s, which matured April 17, 1923.

There will still remain outstanding $30,300,000 United Railways first general mortgage 4 per cent bonds, dated July 1, 1889, due July 1, 1934, of which $42,000,000 were originally authorized, $32,231,000 issued and $1,931,000 canceled. These bonds remain as the senior lien of the new system. The only bonds, therefore, materially affected by the plan are the St. Louis Transit improvement 5s, each $1,000 of which is to receive five and one-half shares of new $7 dividend preferred stock and $300 in cash. Both preferred and common stocks of the old company are eliminated except that the owners of the same will have certain rights to subscribe to the common stock of the new company at $12.50 per share.

A letter addressed by the receiver to the reorganization managers states that in about five and one-half years of the receivership a total of $5,125,517 has been expended on the railway, its equipment and power facilities, of which sum $4,498,598 is net addition to the capital plant. In the same time, $20,145,235 was expended for maintenance and replacements.

Under date of Oct. 1 Rolla Wells, receiver of the company, reported to Frank O. Watts, chairman of the reorganization committee, on the earnings of the company for the twelve months ended Dec. 31, 1923, and the eight months Jan. 1, 1924, to Aug. 31, 1924. These figures follow:

	Year Ended Dec.31,1923	Eight Months Jan. 1 to Aug.31,1924
Gross operating revenue....	$20,453,445	$13,124,895
Operating expenses (including reserves and taxes)....	16,955,786	11,362,136
Income from operation......	$3,497,659	$1,762,759
Non-operating income......	225,700	182,641
Gross income..............	$3,723,359	*$1,945,400
Interest and miscellaneous charges..................	2,913,614	1,902,528
Surplus..................	$809,745	$42,872

* It is estimated that for the year 1924, based on 10 months actual results, this gross income will amount to $2,954,850.

The United Railways, then known as Central Traction Company, was formed in 1898 as a consolidation of about thirty existing companies up to that time operating more or less independently. As a result of the assumption of securities then existing, the issuance of additional bonds at about the time of the consolidation and subsequently, this railway system of now approximately 483 track miles has a capitalization of $91,986,000, of which $50,690,000 was interest-bearing indebtedness, represented by bonds of various kinds requiring $2,361,980 yearly for interest alone. In addition, the company borrowed as a short-term accommodation from the War Finance Corporation $3,235,000, the inability to repay which, so it is stated, in 1919 was the direct cause of the appointment of the receiver.

Holders of Chicago Securities Willing

Bankers who represent the holders of approximately $100,000,000 of securities of the various properties comprising the Chicago Surface Lines have promised the city of Chicago to accept the city's notes in exchange for Surface Lines securities in the event of a municipalization of the lines. All they ask is protection in the management of the lines and other safeguards during the life of the notes.

For more than three weeks quiet accumulation of the underlying bonds of the Surface Lines companies has been in progress. Additional activity resulted from the city's acquiescence to the traction bankers' ultimatum for a price based upon capital account value, $162,000,000, or appraisal. Inasmuch as experts declare the appraisal of the Surface Lines will exceed the $162,000,000, it was said that would be the figure paid.

Yonkers Railroad Lost $350,000, Commission Told

Evidence of losses for 1923 and the first six months of 1924 totaling more than $350,760 on the five trolley lines it seeks to abandon in Yonkers was submitted to the Public Service Commission at the second hearing held in Yonkers Nov. 21 on the petition of the Yonkers Railroad, a subsidiary of the Third Avenue Railway of New York, for abandonment. Public Service Commissioner Oliver C. Semple conducted the hearing, which was adjourned until some time in December.

The gross receipts for the fiscal year ended September, 1924, were $1,285,823. In 1918 the gross receipts approximated $824,000. Since that year, moreover, there have been three wage increases. E. M. T. Ryder, civil engineer in charge of the track repairs for the Yonkers Railroad, estimated that the cost of replacing ties and executing general reconstruction on various parts of the five lines under discussion would total approximately $174,200. With no tracks to repair on these routes a saving of $25,000 a month would result.

Definite assurance that the company was willing and prepared to substitute bus service in place of the five trolley routes was given by railway officials, who declared that the operating costs of their roads had increased since 1918 and that the 1919 peak prices for materials had not been reduced.

Successor Officers Named

The personnel of the Winona Service Company, Warsaw, Ind., incorporated several months ago to operate the line formerly known as the Winona Interurban Railway, is as follows: President, Harry Reid; vice-president, Theodore C. Frazer; secretary and treasurer, J. P. Goodrich; auditor, J. R. Steinebach; in charge of operation, F. L. Oppenheimer; roadmaster, C. L. Reese; master mechanic, C. F. Sigler; line foreman, O. R. Ferguson; safety director, James Harmon; purchasing agent, W. S. Campbell; traffic manager, J. O. Motto, and chief electrical engineer, C. C. Argalite.

All Preferred Stock of New Orleans Property Sold

Every car of the New Orleans Public Service, Inc., comprising the entire parish of Orleans, bore the following announcement on Dec. 2:

ALL SOLD

All the preferred stock we have to offer at this time has been sold. Thousands of our customers and employees are now stockholders in this company. We appreciate this expression of confidence. THANKS.

NEW ORLEANS PUBLIC SERVICE, INC.

This announcement concluded the advertising campaign for the sale of preferred stock of the company started some time ago. More than 15,000 shares of stock were sold to 5,200 individuals. The clerical forces of the company, conductors and motormen, the trackmen and other employees of the transportation and maintenance of way departments of the system all enlisted as salesmen.

In referring to the gratifying results and the encouragement given the company by the public of New Orleans H. B. Flowers, president of the company, disclosed that an Eastern investment banking house had purchased for distribution among its investors a substantial block of the stock, absorbing all of the preferred stock now available.

Beaver Valley Company Abandons Two Miles—Coaches Substituted

The Beaver Valley Traction Company, New Brighton, Pa., has abandoned, with the common consent of two different towns, a division of its property 2.5 miles long, replacing the service with motor coaches. The line abandoned connected the towns of New Brighton and Beaver Falls and traversed sections of the towns different from those covered by the trunk line of the company.

The railway line did not pay. Lack of revenue prevented the company from keeping up its maintenance. To rehabilitate the property would have involved an expenditure of $125,000. When the two boroughs decided to improve the streets over which the line operated the question of abandonment arose. The two towns requested the railway to repair its pavement and fulfill the franchise requirements. This proposal was met by the request that the two towns resurface over the tracks of the railway and permit operation of coaches instead.

In obtaining the approval of the Public Service Commission for the abandonment of the railway and the right to operate coaches, C. D. Smith, general manager, was able to have the borough representatives appear before the commission as witnesses for the company. No protests were filed. One section of the agreement made with the borough describing the rights still held by the traction company states that the agreement shall be in effect for 49 years with the right reserved to the railway at any time previous to the end of the term to reconstruct the railway tracks.

It is provided, however, that in such event the traction company or its successors so reconstructing the tracks shall bear the entire cost of repaving between the rails and 18 in. outside.

Another section stated that the Borough of Beaver Falls shall not grant to any other company or individual the use of the streets covered by the contract for railway purposes.

The coach line is now being operated over the resurfaced streets and is giving more service than the former single-track railway line. This operation is by the Beaver Valley Motor Coach Company, a subsidiary of the Traction Company, under the management of C. D. Smith. A 10-cent cash fare prevails, with a ticket rate of seven for 50 cents, instead of the previous 5-cent fare which existed on the car line. The coach line is earning 30 cents per mile. The railway earned 23 cents per mile.

This is only one of the three coach lines being operated under the supervision of Mr. Smith in the territory covered by the Beaver Valley Traction Company. One of the other lines is operated from the terminal of the Pittsburgh & Beaver Street Railway at Leetsdale, through the Boroughs of Edgeworth, Shields, Quaker Valley and Sewickley, making connections with cars of the Pittsburgh Railways at the Sewickley Bridge. The third line is that operated between Rochester and Colona, across the Ohio River Bridge from Rochester into the Borough of Monaca, paralleling the tracks of the Beaver Valley Traction Company to the end of the line and then continuing on to Colona, a distance of 0.875 mile.

Pierce-Arrow coaches are being run. They are equipped with bodies made by the E. J. Thompson Body Company, Pittsburgh. Each seats 24 passengers.

The railway did not feel that it was warranted in risking the $125,000 for improvements and still face possible further unprofitable operation of the railway. As compared with this expenditure the bus installation is estimated to have cost $21,000. After three months operation the gross earnings of the bus line are 30 per cent greater than the earnings of the railway for a similar average comparable period.

Six-Mile Vermont Road Discontinued

The Bellows Falls & Saxtons River Street Railway, Bellows Falls, Vt., operating 6 miles of electric railway in a town of 5 000 inhabitants, has been discontinued. A year ago the carhouse and most of the rolling stock were destroyed by fire and although the equipment was replaced and the service maintained the company was dealt a financial reverse that has added to its difficulties. E. A. Pierce, former superintendent, is running a taxi service to carry mail and passenger service. No special. provision has been made for the large freight service that was done by the railway. At a public meeting on Dec. 5 business men and citizens of Saxtons River were recorded as opposed to the establishment of a bus line, and for the present will rely on the taxis and on independent, privately conducted facilities for handling freight. The road was built by C. W. Blakeslee & Brother, New Haven, and members of that family have been the principal owners. It was opened for service on June 13, 1900.

Trenton and Philadelphia Companies Merge

The Trenton, Bristol & Philadelphia Street Railway, the Pennsylvania & New Jersey Street Railway and the Philadelphia, Frankford & Tacony Traction Company, Philadelphia, Pa., have been consolidated. The company intends to rebuild a goodly portion of the roadway between Trenton and Bristol and purchase new cars with the intention of establishing express service between Trenton, N. J., and the elevated railway of the Philadelphia Rapid Transit Company at Frankford. The purchase by the Bristol company takes all the franchise rights the Pennsylvania & New Jersey now has in Pennsylvania, including the Morrisville and Yardley lines, and also the terminal privileges of the Trenton & Princeton Traction Company at Trenton, N. J.

Preferred Stock Offered.—The Old Colony Trust Company, Boston, and Bonbright & Company, New York, are offering at $97 a share and accrued dividends to yield more than 7.20 per cent 22,000 shares of cumulative preferred stock (no par value) of the New Orleans Public Service, Inc., New Orleans, La. The company owns and operates properties formerly owned and controlled by the New Orleans Railway & Light Company. These include 222 miles of electric railway. The value of the property as recognized by the city of New Orleans for rate-making purposes, including expenditures for additions and improvements to Oct. 31, 1924, is about $59,500,000.

Bonds Offered.—A syndicate, headed by Estabrook & Company, Boston, is offering at 92 and interest to yield 5.55 per cent $2,000,000 of first and refunding mortgage 5 per cent gold bonds of the Columbus Electric & Power Company, Columbus, Ga. The bonds known as Series B, are dated Nov. 1, 1924, and are due Nov. 1, 1954. The proceeds from this series will provide a portion of the fund for new hydro-electric development at Bartlett's Ferry, now in the course of construction.

Dividend Increased by Public Service Corporation of New Jersey.—Directors of the Public Service Corporation of New Jersey at their meeting on Dec. 2 increased the dividend rate on the no par common stock from $4 to $5 by declaring a quarterly dividend. Thomas N. McCarter, president of the corporation, in a statement following the meeting, said. "For ten months, this year the number of electric meters on our lines increased in round figures from 426,000 to 505,000, a gain of 79,000, and in the same period the number of gas meters in service jumped from 609,000 to nearly 638,000. There is a continued healthy demand for electricity and gas for industrial purposes, and the transportation situation is measurably better than it was a year ago."

Stock Increased.—A certificate has been filed in the office of the Secretary of State at Albany increasing the authorized capital stock of the Elmira Water, Light & Railroad Company, Elmira, N. Y., from $5,200,000 to $6,200,000.

Increased Fare Does Not Reduce Patronage.—Receipts of the Springfield Street Railway, Springfield, Mass., for November, show that there has been little reduction of patronage as a result of the increase of fares from 7 cents to 10 cents with three tickets for a quarter. Operating receipts for the month were $248,097, against $238,293 for the first thirty days of October and $241,565 for November, 1923. It is stated by General Manager H. M. Flanders that 91 per cent of the revenue for last month was derived from the sale of tickets at the three-for-a-quarter and zone rates and that the increased use of tickets has had a decided effect in speeding up traffic.

Auction Sales in New York.—At the public auction rooms of A. H. Muller & Sons there were sold this week $10,000 of Second Avenue Railroad, New York, N. Y., first mortgage 5 per cent bonds due February, 1948, 1908 and subsequent coupons attached, $100 lot.

Approval of $2,000,000 Mortgage Sought. — Approval of a corporation mortgage and immediate issuance of $2,000,000 of general mortgage bonds was asked in an application filed with the Illinois Commerce Commission at Springfield, on Nov. 29, by the Aurora, Elgin & Fox River Electric Company, Aurora, Ill. The company operates 75 miles of electric railway.

Seeks Interest Share.—The city of Seattle and the State of Washington have brought actions against King County in the Superior Court, seeking a share of the $254,261 interest on the 1919 street railway taxes recently paid the county by the Puget Sound Power & Light Company. The city contends its share is $113,725, while the state, through Attorney-General John H. Dunbar, asks for $38,213. County Treasurer W. W. Shields has stated that he will resist the action, maintaining that while both city and state were entitled to a share in the delinquent taxes, they had no title to interest.

Petition for Abandonment Filed.—The Public Service Commission held a hearing recently at New York City before Commissioner Semple on the application of the Northport Traction Company for consent to discontinue its 2.69-mile surface railroad at Northport, L. I. The road runs from the station of the Long Island Railroad to the village proper.

Manhattan Payment Deferred. — At the meeting of the directors of the Interborough Rapid Transit Company, New York, on Dec. 9, it was voted that the installment of Manhattan dividend rental, due on Jan. 1, 1925, be deferred. Under the terms of the Interborough-Manhattan readjustment plan of 1922 the amount of the quarterly installment of Manhattan dividend rental due on Jan. 1, 1925, is determined by the earnings for the three summer months ended Sept. 30, 1924. The earnings for that period, calculated as provided for in the plan, were not sufficient to warrant payment at the 5 per cent annual rate now applicable.

Additional Appropriation Required.—A final appropriation of $10,000, sufficient to carry on the work of valuing the properties of the Milwaukee Electric Railway & Light Company in connection with the proposed service-at-cost contract with the city, has been requested by the street railway acquisition committee. Previous appropriations have permitted an audit of the company's records up to 1921. This additional amount is needed so that the inspection of the books for 1922, 1923, 1924 will be completed by July, 1925.

Merger to Proceed.—The State Public Utilities Commission has refused to pass on an application for approval of the sale of the Tiffin & Fostoria Railway to the Toledo, Fostoria & Findlay Railway for $30,000. This is taken to mean an early merger of the two lines. The application was not acted upon by the commission on the ground that it lacks jurisdiction over the sale. Through Toledo-Tiffin service will be started by Jan. 1.

Another Duluth-Superior Payment.—The Duluth-Superior Traction Company, Duluth, Minn., has declared a dividend of $1 a share on the preferred stock, payable on Jan. 2 to holders of record Dec. 16. This is the same amount as had been paid quarterly for some time, with the exception of the payment due Oct. 1 which was passed.

Mortgage Bonds Offered.—A syndicate headed by Harris, Forbes & Company, New York, is offering at 95 and interest yielding more than 5.45 per cent $3,266,000 of first and refunding mortgage 5 per cent gold bonds of the Montreal Tramways, Montreal, Que., operating 270 miles of electric railway. The bonds are dated July 1, 1911, and are due July 1, 1941.

Book Reviews

Industrial Coal; Purchase, Delivery and Storage.

A report of the American Engineering Council. 419 pages. Ronald Press Company, New York, 1924. 419 pp.

This engineering survey of the possibilities of improving present methods of purchase, delivery and storage of coal was made at the request of the Federal Coal Commission and has been conducted with the co-operation of more than 400 engineers. The results are presented in 12 chapters, each signed by the author or authors, who took a prominent part in the study.

Briefly, the committee believes that seasonal storage of coal by consumers will overcome most of the difficulties now experienced, that sufficient storage will be obtained if each consumer annually purchases coal on a uniform monthly delivery basis, that such storage can be undertaken without serious risk or loss at a not very large expense and that this storage should take place at the point of use, or as near thereto as possible.

Management's Handbook

By a staff of specialists, L. P. Alvord, editor-in-chief, Roland Press Company, New York. 1924. 1607 pp.

In view of the great progress made in recent years in administration and management engineering, there is undoubtedly a call for a handbook on the subject, and the one just published, the first to be compiled, well answers the requirements. There are 32 sections in the book, each written by one or two experts. Briefly, these sections are divisible in three groups. The first, including the first four sections, is devoted to general information of fundamental character. The 17 sections forming the second group deal with established management functions, methods and mechanism, while the third covers such basic information as economic principles underlying industry, organization, budgetary methods, cost accounting, etc. There is much in the book which will be found useful on an electric railway property, particularly in the shops and storerooms.

Personal Items

Earl Sipe Made Akron City Superintendent

Earl Sipe has recently been appointed superintendent of the Akron City railway system and the Akron-Barberton-Wadsworth Division of the Northern Ohio Traction & Light Company. Mr. Sipe takes the place made vacant by the promotion of O. L. Freeman to traffic engineer. John Flaherty has been acting as superintendent since Sept. 1. He will continue as assistant city superintendent, the position he held prior to the transfer of Mr. Freeman.

Mr. Sipe has been general foreman of the Kenmore shops since May 15, 1923. Prior to that time he was chief clerk to the superintendent of equipment in the shop. He began work with the company as train dispatcher at Silver Lake Junction on Sept. 15, 1918, coming from the Cleveland Southwestern. He has had much experience as a motorman, conductor, train dispatcher, shop worker and instructor of trainmen. He is thoroughly acquainted with the Akron City work, as well as with the balance of this system.

Mr. Sipe entered railway service in May, 1906, when he became a conductor on the city lines of the Mansfield Railway, Light & Power Company, in Mansfield, Ohio. He was then in his teens. In June, 1908, he secured a place as motorman on the Cleveland, Southwestern & Columbus Railway, running between Bucyrus and Cleveland.

Two years later Mr. Sipe went to the Illinois Traction Company, with headquarters in Decatur and Staunton, Ill., as train dispatcher. Three years later he went back to the Cleveland, Southwestern as train dispatcher at Mansfield. In the spring of 1916 he was appointed traveling motorman over the entire system. In this work he acquired a general knowledge of men and learned the value of proper instruction. The following year he was appointed as general foreman of the Elyria shops. In September, 1918, Mr. Sipe entered the service of the Northern Ohio Traction & Light Company, in train service and shop work.

Blaine Gavett, secretary of the American Public Utilities Company, Grand Rapids, Mich., recently sold to the Insull interests, has gone into the wholesale oil and coal business in that city. Associated with Mr. Gavett is Willis J. Ripley, formerly treasurer of the company.

A. L. Linn, Jr., formerly vice-president and treasurer of the United Gas & Electric Corporation and the United Gas & Electric Engineering Corporation, New York, N. Y., has recently been elected president of the Colonial Gas & Electric Company, which has acquired the Newport Electric Corporation, Newport, R. I. The company at Newport operates the electric railway in Newport, Middletown, Portsmouth and Tiverton and generates electric current for light and power purposes in Newport, Middletown, Portsmouth and Jamestown, R. I. Mr. Linn is very well known in the electric railway field. He entered railway work in 1893 with the Cleveland Railway and later was for many years with the Utica & Mohawk Valley Railway and the New York State Railways.

F. R. Smalley has resigned as traffic manager of the San Diego Electric Railway, San Diego, Cal., to become general manager of the California Parlor Car Tours, Inc., with headquarters at San Francisco.

Ralph F. Carley, Quincy, has been named general manager of the western Illinois division of the Illinois Power & Light Corporation, with George F. Grote assistant manager. The headquarters are to be established in Galesburg, Ill., with the completion of the remodeling of the block at Kellogg and Simmons Streets. These men will direct business and operation of the interurban lines and local traction lines in the Quincy, Galva, Monmouth and Galesburg districts of the division.

H. N. Wood has been appointed commercial manager of the Pennsylvania-Ohio system, in charge of all sales and allied activities. He has held various positions with the system since 1914. Prior to that he was connected with the Westinghouse Electric & Manufacturing Company.

F. R. Phillips, mechanical and electrical engineer of the Pittsburgh Railways, Pittsburgh, Pa., was re-elected president of the Pennsylvania Street Railway Association at the meeting of the members of that association, in Harrisburg, on Dec. 5.

R. Harland Horton, vice-president of the International Railway, Buffalo, N. Y., in charge of traffic, has moved to Philadelphia and will be associated with the Philadelphia Rapid Transit Company, in special work. Herbert G. Tulley, president of the International, says that Mr. Horton will remain an officer of the Buffalo company.

John Goguel has been made roadmaster of the Fort Wayne & Decatur Traction Company, with office in Fort Wayne, Ind.

J. W. Osborne, formerly master mechanic of the Terre Haute, Indianapolis & Eastern Traction Company, is now superintendent of equipment with office in Lebanon, Ind.

W. H. Fairbanks has succeeded C. H. Parr as secretary of the Charles City Western Railway, Charles City, Iowa.

E. A. Young has succeeded C. C. Coan as treasurer of the Clinton Street Railway, Clinton, Iowa.

L. B. Andrus has succeeded Joseph H. Brewer as president of the Northern Indiana Power Company, Kokomo, Ind. Fred Olvey has succeeded L. C. Fitzsimmons as chief engineer of the power station.

J. N. Campbell has succeeded Edward Heydon as superintendent of overhead construction of the Indianapolis Street Railway, Indianapolis, Ind.

G. Rake has been appointed general foreman of the Kenmore shops of the Northern Ohio Traction & Light Company, Akron, Ohio, to succeed Earl Sipe, recently appointed superintendent of the Akron city lines. Mr. Rake has been connected with the company for several years.

P. L. Gray has replaced R. A. Crews as auditor of the Southern Illinois Railway & Power Company, Harrisburg, Ill. R. B. Tulpin is now the secretary. He succeeds P. A. Erlach.

O. L. Frazee has replaced J. P. Gannon as master mechanic of the Gary Street Railway, Gary & Hobart Traction Company and the Gary & Valparaiso Railway, Gary, Ind.

H. L. Bennett, formerly secretary and auditor of the Vincennes Electric Railway, Vincennes, Ind., is now in charge of operation and is fulfilling the duties of secretary and treasurer.

A. R. Horr is now secretary of the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind. He succeeds R. R. Alexander, who performed the duties of secretary and treasurer.

H. C. Mackay, formerly secretary, treasurer and auditor of the Evanston Railway, Evanston, Ill., has been made vice-president, but will continue to serve as secretary. Charles F. Speed, vice-president in charge of operation, will perform the duties of treasurer. The transportation department is in charge of J. M. Sills.

Obituary

August Belmont

August Belmont, chairman of the board of the Interborough Rapid Transit Company, New York, financier and sportsman, died at 6:30 p.m. on Dec. 10 in his apartment in New York, less than thirty-six hours after he had been taken ill in his office. Mr. Belmont was 71 years old.

The directors of the company, as a mark of respect for the memory of Mr. Belmont, directed that at 4 o'clock on the afternoon of his funeral, Friday, Dec. 12, all movements of trains be stopped for a period of one minute. In addition the secretary was requested to prepare an appropriate memorial to be submitted at the next meeting for entry upon the minutes expressing the sympathy and profound regret of the directors and recording their recognition of his accomplishments, personal charm and integrity.

One of the outstanding achievements of Mr. Belmont was the financing of the first New York subway. Mr. Belmont had generally received a large share of the credit for the successful completion of the enterprise but no more credit than is properly due to him. Others hesitated, skeptical of the outcome, but Mr. Belmont went ahead. Then when the correctness of his judgment had been proved it was sought to jockey him out of his advantageous position.

Mr. Belmont obtained the contract

for the building of the original subway and a lease of the property for 50 years, with a 25-year renewal. When he started to build the subway the Whitney group began to make war on him for control of the transit situation in New York. Thomas F. Ryan was the principal member of the Whitney group, and a battle to the finish ensued between Belmont and Ryan. The Goulds, who controlled the Manhattan Railway, elevated lines, also waged war on Belmont. Mr. Belmont finally leased the Manhattan for 999 years.

Belmont and Ryan eventually arranged for a merger of their traction interests. This resulted in the organization of the Interborough-Metropolitan Corporation, an incongruous financial structure which has since passed out of the traction picture and which many at the time felt was ill conceived.

Mr. Belmont was jealous of the good name of the Interborough Rapid/Transit Company. Some years ago he said:

> The Interborough is the only company in my experience that can claim the distinction of doing any serious service for the improvement of traffic conditions in Greater New York, in spite of the abuse it has received. The treatment of this company has not been such as to inspire further effort on the part of private enterprise, and until private enterprise is encouraged and confidence restored we won't have any improvement. You can split the present system into its original component parts, but you won't have five feet additional service added to the system.
>
> The transportation problem must be treated from the standpoint of a reasonable return on the money invested, whether it be the city's or private money. You can't treat it on an ideal basis.

Mr. Belmont was educated at the Rectory School, Hamden, Conn., at Exeter Academy, at Haverford College and at Harvard College. He was graduated from Harvard in the class of 1874. He entered his father's banking house in September, 1875, the year after his graduation from college. Mr. Belmont learned the business from the ground up, and after his father's death in 1890 became the head of the house.

William Harris, vice-president of the Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y., died on Nov. 29 at Northville. He had been interested in this property since its construction, and was a member of the board of directors for many years. Mr. Harris was 76 years old.

Wages Up 100 per Cent Over 1914

Wages, as measured by average hourly earnings, have made a net gain of more than 100 per cent in the last 10 years, while the average of the cost of living has made a net advance of about 60 per cent. These figures are contained in a survey made a short time ago by the National Industrial Conference Board.

In September, 1924, the cost of living index number determined by the board stood 63.7 per cent above the level of July, 1914, as compared with 63.4 per cent in September, 1923. During the year ended September, 1924, hourly earnings of all wage earners remained practically constant. There was, therefore, no considerable change in "real" hourly earnings during the year.

The highest point reached, during the ten years reviewed, by the index number of "real" hourly earnings based on conditions in July, 1914, as 100, was 142, and the lowest point 139. In September, 1924, it stood at 141.

The substantial increase in actual weekly earnings between August and September of this year advanced the index number of "real" weekly earnings to 126 for the month in spite of the fact that the cost of living index number had also advanced nearly a point. Translated into other terms it means that in September, 1924, the contents of the average employed wage earner's pay envelope would purchase 26 per cent more of the necessaries of life than in July, 1914.

In referring to the industrial depression from which the country is now definitely emerging, the board expresses the opinion that the fear of the wage earner that a lower wage scale introduced as a temporary expedient may become a permanent level is not justified by facts. The wage reductions of 1920 and 1921 paved the way for and hastened the recovery of 1922-23, which was responsible in the early months of 1923 for the very general wage increases.

The report, which comprises the fullest data up to the end of September, 1924, concludes that employment, earnings and hours of work all registering substantial gains at a time of the year when manufacturing activity is usually low may be regarded as reliable evidence that the long anticipated upward turn has begun and that in spite of temporary reactions industry may reasonably soon look forward to a more satisfactory period of operating conditions.

Metal, Coal and Material Prices

Metals—New York	Dec. 9, 1924
Copper, electrolytic, cents per lb.	14.25
Copper wire base, cents per lb.	16.875
Lead, cents per lb.	8.90
Zinc, cents per lb.	7.45
Tin, Straits, cents per lb.	55.00
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.125
Somerset mine run, Boston, net tons	2.15
Pittsburgh mine run, Pittsburgh, net tons	1.875
Franklin, Ill., screenings, Chicago, net tons	1.50
Central, Ill., screenings, Chicago, net tons	1.35
Kansas screenings, Kansas City, net tons	2.15
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.65
Weatherproof wire base, N.Y., cents per lb.	17.75
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.14
White lead in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.152
Turpentine (bbl. lots), N. Y., per gal.	0.84

Large Lubrication Contract Renewed

The Texas Company, producers of Texaco petroleum products, has renewed its contract with the Brooklyn-Manhattan Transit Corporation and the New York Rapid Transit Corporation. The contract calls for Texaco oils to lubricate the entire rolling equipment of these two great metropolitan transit organizations.

Commerce Body Defends Trade Associations

The position of American business on important current national economic questions was recently put before President Coolidge by the Chamber of Commerce of the United States in a statement setting out principles upon which the chamber lays emphasis as especially timely. In each instance the chamber's proposals are the result of action by the organization's membership. The subjects dealt with include: Repeal of income tax publicity; creation of a national tax commission; declaration of a policy regarding trade associations; the establishment and carrying out of a merchant marine policy; development of waterways; the Railroad Labor Board; the setting up of an immigration commission, to recommend and administer legislation; extension of the budget system.

The chamber thoroughly believes that trade associations, legitimately conducted, are an essential element to the promotion of American business and that legislation which would make them impossible, or make it impossible for them to function properly, would hinder not only industry but also the prosperity of the nation. It is felt that organizations and individuals against whom no accusation under existing law has been brought or is in contemplation are subjected to the injustice of being viewed with suspicion by the public.

The chamber holds no brief for trade associations that infringe the law, but seeks to point out the facts so as to remedy a situation which is already tending to hinder the development of business. The larger and richer the corporation, the less its needs for a trade association. Not so with the smaller concerns. They cannot afford, except through pooling their interests, to secure business data. The membership of the chamber, through a referendum vote, has made the following recommendations regarding the use of statistics by trade associations:

> Statistics of capacity, production, stock and sales, and statistics of actual prices in closed transactions, should be collected by a trade association for its industry or branch of commerce.
>
> Such statistics should be distributed without any comment or interpretation which could induce or facilitate concerted action on the part of members.
>
> The statistics should be made as available by a trade association to the public and government agencies as to the members of the association.

Rolling Stock

Jacksonville Traction Company, Jacksonville, Fla., is negotiating for the purchase of two additional cars.

Gary & Valparaiso Railway, Gary, Ind., has plans under way for the purchase of two new combination passenger baggage and smoking cars at a cost of $40,000.

Kewanee Public Service Company, Kewanee, Ill., has purchased 12 new cars of the Birney safety type.

Trenton & Mercer County Traction Company, Trenton, N. J., has placed 10 new cars in operation and has ordered 10 more. These cars cost $13,000 each. It is intended to operate them with one man.

Trenton, Bristol & Philadelphia Street Railway—Pennsylvania & New Jersey Street Railway, Philadelphia, Frankford & Tacony Traction Company. —Philadelphia, Pa., recently amalgamated, plans to purchase new cars.

Shreveport Railways, Shreveport, La., has just placed in service three new cars built by the American Car Company, St. Louis. These are double-truck, single-end, front-entrance, center-exit, one-man, two-man type. The length over all is 40 ft. 9 in. The total weight is approximately 30,000 lb. When arranged for one-man operation the car will seat 55 passengers, but when operated by two men the seating capacity is only 47.

Track and Line

Miami Beach Electric Company, Miami Beach, Fla., has started work on new tracks which are to be constructed on Washington Avenue, Biscayne Avenue, Ocean Drive and First Street.

Iowa Railway & Light Company, Cedar Rapids, Iowa, has completed a loop in Des Moines which will give a number of towns it serves duplicate service. The loop as completed extends from Boone west to Grand Junction, south to Perry, east to Madrid and north to Boone.

Cleveland Railway, Cleveland, Ohio, has filed plans for the erection of a one-story brick and steel substation at 1004 Central Avenue, to cost $45,000.

Chicago Surface Lines, Chicago, Ill., opened up two extensions recently aggregating about 1 mile. The West Seventy-first Street line was extended from South Western Avenue to California Avenue, making an additional route to Marquette Park. The Western Avenue line was extended from Seventy-first to Seventy-fifth Street with the expectation that it will subsequently extend several miles south into territory now developing.

Johnstown Traction Company, Johnstown, Pa., has completed its 1924 program of track renewals and street improvements at a cost of $239,520. This is the fifth year during which extensive work of this kind has been done by the company. Since the beginning of 1920 more than $850,000 has been spent for street improvements by the railway. The program will be continued next year, but definite plans have not yet been formulated for this work.

Georgia Railway & Power Company, Atlanta, Ga., is putting the finishing touches on a number of paving and track rebuilding projects before the close of the current year. One of the major projects recently on Fair Street necessitated rebuilding the entire roadway area, including the laying of heavier tracks and repaving of the street. A new type of work in which steel cross-ties were used was completed recently on Highland Avenue. Double tracks were installed on Pryor Street and Georgia Avenue and the rebuilding work on Kelly Street was completed. The laying of double track and the construction of a left-hand branch-off at Whitehall and Cooper Streets and the installation of two new crossings at Georgia Avenue and Washington Street are other jobs which have been completed, also the improvement program begun some weeks ago on Broad Street.

New Incorporation

St. Louis-Kansas City Short Line Railroad, St. Louis, Mo., has been incorporated. The articles provide for an authorized capitalization of $2,400,000, of which $240,000 has been subscribed. The incorporators are Lee Dunlap and Frank E. Lott, Kansas City, Mo., and Ernest H. Lawhon, Erba D. Smith and William H. White all of St. Joseph, Mo. Mr. Dunlap has stated a standard gage electric railroad is planned, but the company is authorized to use steam, electricity or other motive power. The line would run from St. Louis through Creve Cœur, St. Charles, Warrenton, Jonesboro, New Florence, Columbia and New Franklin, crossing the Missouri River at Arrow Rock and proceed thence through Marshall, Higginsville and Independence to Kansas City. The projected road, 238 miles long, would take 35 miles off the rail mileage between the two terminal cities.

Trade Notes

Economy Electric Devices Company, Chicago, Ill., is calling attention in a special letter to the aluminum coil which it exhibited at the Atlantic City convention. That coil was subjected to the most severe tests possible. A bare aluminum coil, oxidized by the company's usual process, was mounted on a transformer growler. Under one end of this coil was an alcohol lamp. The other end of the coil was kept saturated with water. A vise in the middle of the coil subjected it to pressure far in excess of any pressure a coil would have to withstand in service. The coil was clear of shorts even with one end soaking wet, the other end sizzling hot, and under pressure sufficient actually to deform the wire. Intentional shorts made on the coil would promptly clear themselves by the passage of the current. In the Economy aluminum field coils aluminum oxide is used as the insulator. A trial of the device is urged.

Rail Welding & Bonding Company, Cleveland, Ohio, announces the partial rearrangement of selling territories and the appointment of the following additional sales representatives: For the eastern Pennsylvania territory, Railway Track Work Company, 3132 E. Thompson Street, Philadelphia; for western Pennsylvania and northern West Virginia, Electrical Engineering & Manufacturing Company, 907 Penn Avenue, Pittsburgh, with branch offices in 330 Union Building, Cleveland, and 604 Mercantile Library Building, Cincinnati, Ohio; for the northern section of Illinois and for Wisconsin, Iowa and Minnesota, R. Roy Holden, 310 South Michigan Avenue, Chicago; for Louisiana, Mississippi, Alabama, Florida, Georgia, eastern Tennessee, Texas and Oklahoma City, P. W. Wood, 1003 Carondelet Building, New Orleans, La.; for California, A. W. Arlin, 519 Delta Building, Los Angeles, and for the states of Washington and Oregon, Burton R. Stare Company, 619 Fourth Avenue, Seattle, Washington.

Sullivan Machinery Company, Chicago, Ill., has removed its Cleveland office to Room 701, Rockefeller Building, from Room 824 in the same building. The district manager is Ralph T. Stone.

New Advertising Literature

General Electric Company, Schenectady, N. Y., is distributing a publication on lightning arrester grounds which is an elaboration of a paper by H. M. Towne, presented before the Southeastern Division of the N.E.L.A. at Tampa, Fla., on Nov. 20, 1923.

Horne & Ebling Corporation, 50 Church Street, New York, and factory in Jersey City, has listed in a four-page circular devices which it handles under the main heads: Motor and Controller Parts, Car Hardware, Line and Track Equipment, Specialties and Heat Treatment of Steel. Among the products of the company are brakes, malleable and brass castings, watertight crossing bells, junction boxes, case hardened pins, track sanders, car sash fixtures and trolley bases. The company is prepared to design and manufacture special railway devices.

Atlas Lumnite Cement Company, New York, N. Y., has published a 30-page pamphlet in which Lumnite cement is described and its uses illustrated. Instances are reported where Lumnite has proved an advantage in concreting between and along tracks of various electric railways.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has released folder 4586, a single-phase road locomotive for preference freight service. This folder describes the new single-phase locomotive known as the Type L-5, which has recently been placed in service by the Pennsylvania Railroad, and a supplement to the folder describes the L-5-A, d.c. locomotive, which has also just been completed.

Hoover Safety Conference a Great Constructive Success

A FORCEFUL, constructive influence, looking toward early relief from the terrible toll of life in street and highway accidents, has been set in motion by the National Conference on Street and Highway Safety held in Washington Dec. 15 and 16. The conference on this pressing problem was called by the Secretary of Commerce, Herbert Hoover. He personally acted as chairman during a large part of the deliberations, and the masterful way in which the meetings were conducted and the high character of the work accomplished pay tribute to his great ability as organizer and doer.

It was no small matter to bring together representatives of the many interests concerned from practically every state in the Union, with all their conflicting and divergent views on the subject, and work out of this chaos in two days time a distinctly constructive statement of remedial measures having the whole-hearted approval of so large and representative a conference. It was something of an accomplishment even to get some of the interests together around a common table to discuss this problem. But the preliminary work done in eight committees, the expression of opinion on the committee reports at the first day's sessions, the harmonizing of the views expressed and the compilation of the various recommendations into a consolidated report, and then adoption of this report, section by section, by the whole conference on the second day, constitute a truly great accomplishment.

As finally approved, the recommendations of the conference form a program which all interests can indorse and apply. In some details, it may not satisfy one party or another, but it represents a point of view arrived at after long and careful deliberation by men of highest standing in their own industries and representing all interests concerned. The personnel of the committees and the backing of the federal government give the report a stamp of authority and distinction which should commend it to the careful consideration of all public officials, the railways, the automotive industry and all highway bodies and safety organizations. It will go a long way toward securing the uniformity of regulation and practice throughout the country so sadly lacking now, while avoiding federal regulation in the matter.

Chief among the recommendations of interest to interurban electric railways is that calling for legislative action requiring motor vehicles to come to a full stop at certain railway crossings and putting the responsibility in the hands of the state commissions to designate the grade crossings to which the law is to apply and so to mark them. The proposal of a stop law caused more debate than any other point raised. The railroads naturally want indorsement of the full-stop law without qualification. The final wording, however, is a sensible compromise. The plan adopted, if applied, will doubtless go a long way toward taking the burden of responsibility off the railways, and, what is far more important, toward material reduction in grade crossing accidents.

Street railways are also much concerned directly and indirectly with many of the provisions of the conference report. They will find that they can indorse and help along adoption of the whole program urged. The report is reviewed in another part of this issue, but electric railway men will do well to write to the Department of Commerce, Washington, for a copy of the complete report for study and application, and to support it in a broad way in their own communities.

Definite Limits of Wear Promote Good Maintenance

IN NEARLY all maintenance work the subject of economy is uppermost in the mind of the man in direct charge—and of his superiors also for that matter. Constant effort and attention is directed toward obtaining increased life from the various parts of the equipment without getting excessive road failures. At the same time it is desirable to get the work done at minimum labor cost.

Sometimes, however, the constant pressure for economy causes the ultimate result to be lost sight of when striving for immediate savings. There is a natural tendency in the attempt to get every possible mile of wear out of each part of the car equipment. The desire to "make a showing" in immediate costs may lead to badly run down equipment and poor service.

This shows up strikingly in connection with the replacement of bearings and similar parts that must be periodically renewed and that run into considerable cost. On many properties there seem to be no definitely established limits of wear, and it is questionable whether on many others that do have generally understood limits they are actually lived up to.

An important step toward better maintenance practice will be taken when maximum wear limits are definitely established for all important wearing parts and are then rigidly adhered to. Even though a limit is established and later found to be too high or too low, it can be readily altered and maintenance forces instructed accordingly. But some limit should be established, and when the part becomes worn to that point it should be taken out. In that way only can uniformly good results be obtained.

This is the issue in December that is devoted essentially to maintenance subjects

He Knew When It Was Time to Throw a Machine Away

THAT it very often pays to spend money in order to save money is illustrated by the experience of a master mechanic who recently replaced a still serviceable power-driven hacksaw by one of more modern design. When the suggestion that this be done was originally made to the management of the railway in question, it occasioned some surprise. At first thought it appeared to be an extravagance to throw away one fairly good saw and buy a new one.

But this master mechanic had made a study of machine tools, and he was ready with his argument. He showed the management just how money could be saved by installing a better machine. In this case the better machine was primarily a quicker machine, and at present rates of wages any machine that saves time will soon pay for itself. So, he argued, instead of being an extravagance to install a new machine, it would really be an economy.

The management of this railway is always on the lookout for ways of legitimately reducing expenses. Moreover, the master mechanic was known to be a man with long experience at his work and having sound common sense. So a new high-speed saw was bought and installed in the shop. Its performance soon justified the expense. For example, it reduced the time required to cut through a steel axle to one-tenth the former time. The life of the saw blades was practically quadrupled.

Opportunities to make changes of this kind exist in nearly every railway shop. For thus being able to visualize the possible savings to be effected by throwing away an old machine this master mechanic deserves great credit. Equal credit is deserved by the management which listened with an open mind to his argument and was willing to put the proposal to the test.

Riding Comfort May Have a Stronger Appeal than Cheapness

DRIVING down by automobile from the house to the office is a pretty cold proposition these winter mornings. The wind howls and the snow sifts in through every small opening. An icy covering makes the pavement treacherous. If the old bus stands parked all day and gets snowed in, it may require a half hour's delay and use up the best robe under the wheels to get backed out and headed homeward. On the other hand, riding in the street car is comfortable and warm and safe and convenient.

An appeal to the automobile driver based on some such argument as the foregoing is likely to be effective at this season of the year. This idea was tersely put by Labert St. Clair in a telegram to the Pennsylvania Street Railway Association Convention at Harrisburg on Dec. 5, which was reported in this paper last week. In it he said, "Make the comfort of street car riding rather than the cost of running an automobile the basis of appeal to automobile owners."

That does not mean, of course, that the well-known slogan "Ride the street car and save the difference" is not effective. Its value has been proved by experience in many places and undoubtedly it has influenced a large number of people to ride the railway. But the average American automobile owner is more influenced by comfort and convenience than by cost. He will spend money freely to get what he wants. If he can be convinced that it is more convenient and comfortable for him to ride downtown in the street car than it is to get his automobile out of the garage and drive down, that is more apt to appeal to him than the fact that he is saving 10 or 15 or 50 cents.

Then, too, the economy argument is no longer new to the public in some cities, and novelty is one of the most important requirements of effective advertising. Skillfully worded publicity emphasizing the comfort feature might be more effective now than that which stresses primarily the cheapness of riding the street car.

A Subway Is an Expensive Luxury

IT IS a striking fact that in nearly every large city in the country there is a tremendous demand for subways. This applies notably to the two largest cities, New York and Chicago, but in Detroit, Philadelphia, St. Louis and other cities subway construction, or additions to the present systems, is being strongly advocated by many citizens.

This desire is understandable with the congestion of traffic on the surface of the streets, but the public should realize that subways are a very expensive luxury and that the cost of building them, like the price of many other desirable things, has gone up greatly during the past 10 years. This is shown in the estimated cost figures given out last week in New York for the Mayor's proposed subway between the southerly end of Manhattan and 193d Street. For one of the downtown sections of this line—0.83 route-miles in length—the cost is estimated at more than $25,000,000 per route-mile and the figure for the entire length of the division south of 64th Street—10 route-miles—is given as $114,000,000. This amounts to $11,400,000 per route-mile. Part of this section is two-track, part four-track and part six-track, there being 36.32 track-miles to the 10 miles of route. These cost figures are exclusive of all equipment or of shops, or of any land or easements.

For the section north of 64th Street and as far as 193d Street, the cost on the same basis is estimated at about $8,040,000 per mile of route, there being 6.65 route-miles and 24.95 track-miles. The reduction in these figures from those for the downtown section is due, of course, to less arduous conditions of construction.

Some of the factors which have an important bearing on the cost of building subways are narrow streets with high buildings, especially where this condition is combined with soft subsoil, extent of other substructures in the street, whether the subway is under water level, and the extent of the street congestion over the proposed construction. The latter condition affects the cost of receiving materials and the disposal of the refuse.

Most of these factors are present to some extent in the 0.83-mile downtown section of Manhattan, where the proposed line would have to cross under two subways of the Interborough Rapid Transit Company and one of the Brooklyn-Manhattan Transit Corporation, where much underpinning of these and other structures would have to be done, and where there is not much room for carrying on the work. Above 64th Street, conditions for construction are more favorable and this fact is reflected in the price. But, in general, it may be said that the cost of subway construction has considerably more than doubled since 15 years ago, when a rough estimate for the building of a two or four-track subway was $1,000,000 per single track mile.

Jigs and Dies to Reduce Shop Costs

Chicago Surface Lines Uses Special Tools to Make Many Parts in Punch Presses—These Formerly Required Several Hand Operations—Automatic Stripping and Ejection of the Finished Parts Speeds Up Production

IN THE West Shops of the Chicago Surface Lines many dies and jigs have been developed to hold down the cost of making replacement parts for car equipment. As a result, the number of hand operations has been reduced to a large extent and the punch press has been substituted for hammer, saw, file and drill press. These special tools have been made up from time to time over a number of years, the high wage scales prevalent in Chicago being an added incentive. Although many different types have thus been developed, each expenditure for new dies is carefully supervised and the cost of a proposed new tool is compared with the estimated saving to be made before the work is authorized.

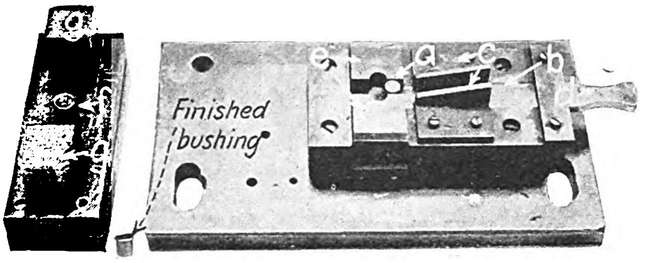

Fig. 1. Die for Rolling Bead on Push-Button Bushings

The pieces are stripped by pulling the handle at the right, which causes the bead on the bushing to engage the inclined surfaces at (*a*).

An endeavor is made to avoid the tendency in railway maintenance practice of manufacturing parts that can be purchased cheaper from other sources. In some cases, however, the decision is determined by the time element in delivery. Special parts that are required in comparatively small quantities frequently cannot be purchased at an attractive price except in large lots. Consequently the cost of carrying large stocks of such parts sometimes makes it desirable to manufacture them in the shop. Since punch press dies can be set up quickly in the machines, it is possible to manufacture comparatively small lots of special parts at prices that more than justify the cost of making up the dies.

The punch press equipment available was originally purchased for maintenance purposes and is not particularly suited to quantity production. It consists mostly of comparatively slow, heavy-duty machines. With the exception of one motor-driven V. & O. Press Company No. 21 punch, these are limited to a Williams, White & Company No. 14 press, a Long & Allstatter combined punch and shear and one other heavy-duty, deep-throat punch. The various types of dies and jigs that have been designed increase the service obtained from these machines. Since there is nothing unusual about the machine equipment available in these shops, the tools to be described are of types that can be utilized with the machines found in most railway shops.

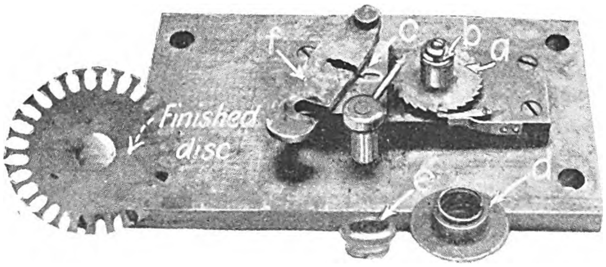

Fig. 2. Equally Spaced Slots in Fish Paper Insulating Disks for Fan Motor Armatures Are Cut in This Indexing Die

In the accompanying illustration, Fig. 1, is shown a die for making push-button bushings for the passenger signal bells on a comparatively large group of cars. This particular type of signal is no longer on the market, and repair parts are therefore not available from the original manufacturer.

The bushings are made of thin brass tubing, with a bead rolled on one end to protect the passengers' fingers. They are first cut off in a screw machine and the bead is then rolled by the punch and die shown in the illustration. The piece of tubing of proper length is slipped on the pin (*a*) projecting from the sliding member (*b*) shown in the illustration. This slide extends out to the right from the body of the die to form a handle at (*d*) which can be grasped by the operator. When the slide is pulled out to the extreme right the pin (*a*) is exposed so that the piece of tubing can be readily dropped into place. The sliding member is then pushed to the left until it strikes a stop. This places the bushing between the two halves of the split forming die (*e*), shown open in the illustration. This is held open by compression springs and is arranged so that the two halves of the die are free to slide in the die block. When the punch, shown at the left, descends, the two heavy lugs (*g*) engage tapered outer faces on the split die (*e*), and as the punch comes down into position the two halves of the die are brought together so as to clamp securely the bushing between them. The top of the bushing is rolled by the punch (*f*) in the center. When the punch is raised from the die the two split members are forced apart by the compression springs mounted between them, thus releasing the bushing and the hand-operated slide (*b*) so that the latter can be pulled to the right by hand. When this is done the newly rolled bead on the top of the bushing engages the two inclined surfaces (*c*), and as the sliding member continues toward the right the bushing is automatically drawn off the pin, so that another piece of tubing can be quickly dropped in place, and the operation repeated. This job is carried out on a V. & O. Press Company No. 21 motor-driven punch at the rate of approximately 2,000 pieces per hour.

A good example of an indexing die for making a number of equally spaced cuts in a single piece of material is shown in Fig. 2. This is used for cutting the slots in the circular fish paper insulation used in small ventilating fan motor armatures.

The round disks are first blanked out of sheet material. The slots for the windings are then cut in the die shown. A disk is slipped over the spindle (*b*) and the guard (*f*) is fastened in place to act as a stripper. The collar (*d*) is then slipped on the spindle (*b*) and the cap (*e*) is placed on top. This cap is provided with a projecting pin on the inside which enters the vertical slot near the top of the spindle (*b*). By pressing down on this cap the spring inside the collar (*d*) is compressed. The cap (*e*) is then given a partial turn so that its pin engages the circumferential slot shown near the top of the spindle (*b*), thus holding the collar (*d*) securely in place and clamping the disk of fish paper on the ratchet wheel (*a*). The various parts just described are all clamped together through the action of the spring inside the collar (*d*), but are free to rotate about the vertical pin in the center of the spindle (*b*). A spring engaging the notches in the ratchet (*a*) allows it to be rotated by hand, one notch at a time, corresponding with the spacing of the slots to be punched in the disk. As the piece is rotated, it is thus indexed to give the required number and spacing of slots. The work is done in a Williams, White & Company No. 14 power punch press at the rate of 25 complete disks per hour.

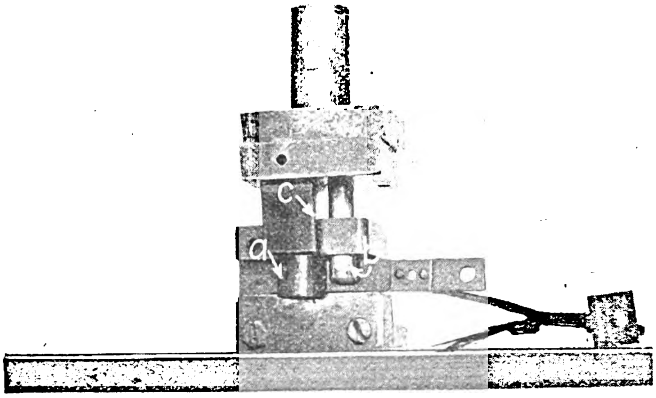

Fig. 3. Burning Tips Are Removed from Controller Fingers with This Equipment, Which Holds the Finger in Place While the Punch Shears Off the Worn Tip

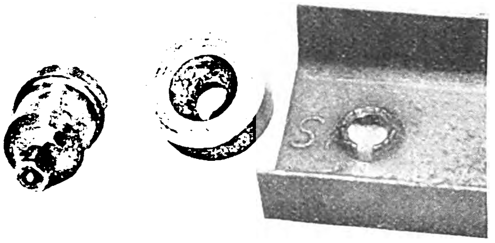

Fig. 4. Holes in Truck Pedestal Wear Channels Are Punched and Slotted at One Time with This Simple Equipment

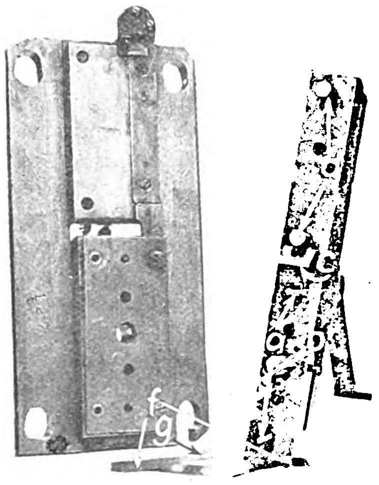

Fig. 5. Car Ribbon Fuses Are Made by a Continuous Process

The two pieces of ribbon are fastened together, the center calibrating hole is punched and the finished fuses are cut to the proper length.

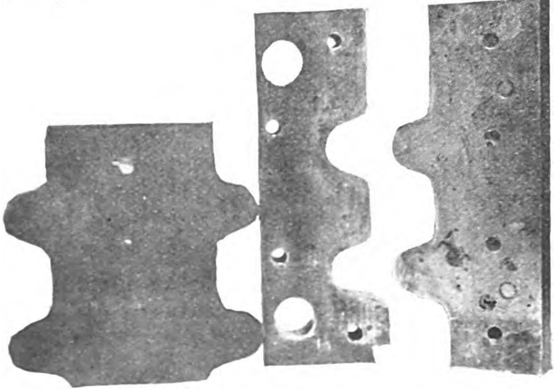

Fig. 6. Case-Hardened Wear Plates Are Bolted to Projecting Ears on Journal Boxes. The Pieces Are Cut to Proper Shape in a Punch Press

A punch and die for the removal of burning-tips on controller fingers offers an excellent example of the substitution of machine for hand operations in salvaging worn parts. This tool, shown in Fig. 3, is designed so that a projecting pin (*b*) on the punch passes through a hole in the die block to hold the finger securely in place while the punch (*c*) cuts off the burning tip (*a*). The condition of the two parts after the tip has been removed is shown at the right side of the illustration. The finger is then ready for a new tip. This work is done in the V. & O. Press Company No. 21 punch press at the rate of about 2,000 pieces per hour.

The simple punch and die shown in Fig. 4 is used to make countersunk slotted holes in 4-in. structural channel wear pieces for truck pedestal jaws. On this particular type of truck the wear pieces are held in place with countersunk head carriage bolts which have a lug at one side to prevent the head of the bolt from turning while the nut is being pulled up tight. As will be seen from the illustration, the punch not only cuts and countersinks the hole, but also forms the slot to take the projecting lug on the carriage bolt. This work is done on a heavy-duty power punch press at the rate of about 200 holes per hour.

CAR RIBBON FUSES MADE COMPLETE

In Fig. 5 is shown an ingenious die for making car ribbon fuses from thin strips of copper. The copper ribbon is purchased in rolls 1 in. wide and 0.005 in. thick. Two of these thicknesses of material are fastened together and a calibrating hole is punched in the center, to form the complete fuse, as shown at the bottom of the illustration. This has been pulled apart to show the two ribbons of copper. The entire operation of making these fuses is completed in the die shown, as a continuous process. The two ribbons of material are fed into the die from two different rolls. The projecting prongs (*a*) on the die pierce the two strips of copper in such a manner as to leave a projecting burr at two points spaced so they will come near each end of the completed fuse. At the same time the center hole (*g*) is punched in the ribbon. As the material is pushed forward again in the die, against a stop which fixes the proper length, the two projecting punches (*d*) flatten the burrs that were made at (*f*) so as to fasten the two pieces securely together. At the same time the descending cutter (*c*) cuts the completed fuse off to the proper length. The operation is then again repeated. This work is done in the V. & O. Press Company No. 21 press at the rate of about 3,500 complete fuses per hour.

A heavy cutting die for blanking out the irregular-shaped journal box wearing pieces shown in Fig. 6 is used in a Williams, White & Company No. 14 press. In this case it is necessary to make two cuts to complete the work, the piece being turned around after the cut on one side has been made. The material is 3/16-in. sheet steel and is later formed and punched to complete the wearing pieces. These are made up so that they can be bolted to projecting ears cast on the sides of the journal boxes. The jig for punching the holes in the ears after the piece has been formed is shown in Fig. 7. This is of interest chiefly because of the complicated shape of the piece to be punched. It will also be noted that several sets of holes in the jig permit it to be used for punching wear plates for different-sized journal boxes.

SEVERAL TYPES OF FORMING DIES USED

Two forming dies of widely different types are illustrated in Figs. 8 and 9. The one shown in Fig. 8 is used for the manufacture of the small eye-bolts shown at the bottom of the illustration. This is part of the car fuse box assembly and is made up cold from 5/16-in. round, cold rolled steel. The pieces are sheared to the proper length and are then formed in four operations. The successive stages of the forming are carried out in order on the four sections of the die marked, respectively, (*a*), (*b*), (*c*) and (*d*). The piece is moved from one position to the other in the die so that it requires four movements of the press to complete the operation. In the first position (*a*) the rod is kinked up at one end. In position (*b*) this kink is depressed so as to bring the stem approximately at the center of the loop. In positions (*c*) and (*d*) the loop is finally completed. The work is done in a Williams, White & Company No. 14 press at the rate of 75 pieces an hour.

Brass channel wearing pieces used to reinforce the stiles of body sash are formed from No. 18 gage strips of the proper width in the punch and die shown in Fig. 9. The completed channel is shown at (*c*) in the illustration. The punch and die shown are used to form the channel only, the screw holes and cuts for the sash locks being made in a second die that is not shown. In the Williams, White & Company No. 14 press these are formed at the rate of approximately 40 per hour.

An excellent example of a die which substitutes punching operations for what would ordinarily be a drill press job is illustrated in Fig. 10. The large holes in the channels that are used as wear pieces on truck pedestals are punched instead of being drilled. The block (*b*) in the die supports the web of the channel so that it can be punched without distorting the flanges. These channel pieces are also sheared to the proper length in a similar die designed to support the piece, so that both the web and the flanges are cut off clean. Both 14-in. and 16-in. lengths of channel are required for different types of trucks, and an adjustable pin at the left of the die shown in Fig. 10 enables the same die to be used for punching pieces of either length. The punching is done in the Williams, White & Company No. 14 press at the rate of 60 pieces per hour.

DIE LOCATES HOLES FROM CENTER PUNCH MARKS

In most railway shops the punching equipment is not suitable for making a number of holes in small structural members which have been laid out with center punch marks. This is due to the fact that such punch press equipment is usually of the rotating type, on which the punch stops in a raised position, making it difficult to locate the center punch so that the hole will be in exactly the proper position. The device shown in Fig. 11 was designed to make an ordinary punch press suitable for such work. When set up in the machine the end of the pointer (*a*) corresponds

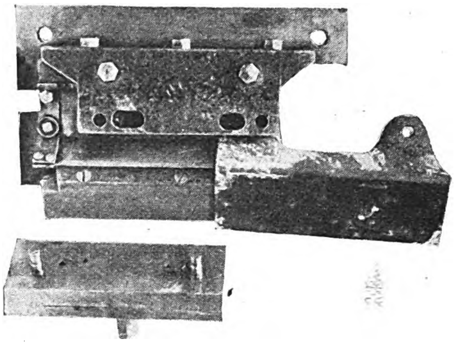

Fig. 7. After Forming, the Wear Plates Shown in Fig. 6 Are Punched in This Jig

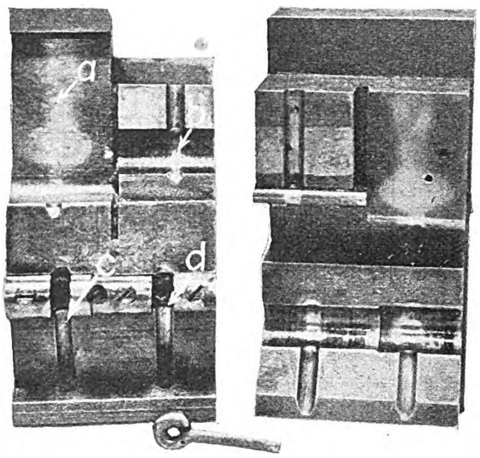

Fig. 8. The Piece Shown at the Bottom Is Formed Cold from 5/16-in. Round Stock in Four Operations

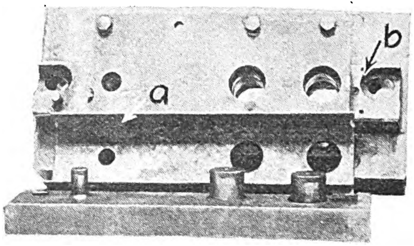

Fig. 10. Die for Punching the Large Holes in Webs of Truck Pedestal Channel Wear Pieces at a Substantial Saving Over Cost of Drilling

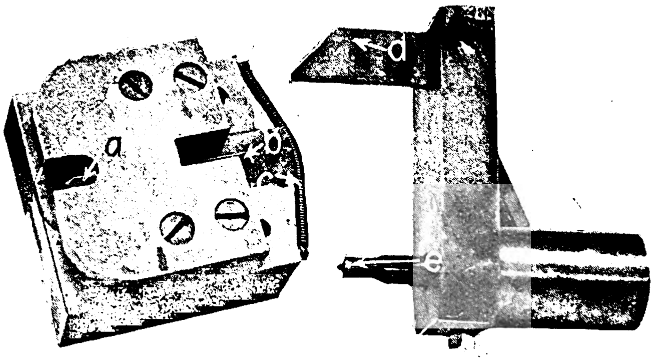

Fig. 11. Die for Punching Holes in Structural Members

The difficulty of working from center punch marks when using an ordinary type rotating press is overcome with this ingenious die, which contains a pointer for locating the position of the hole. The pointer is forced aside as the punch descends and returns to position when the punch is raised from the work.

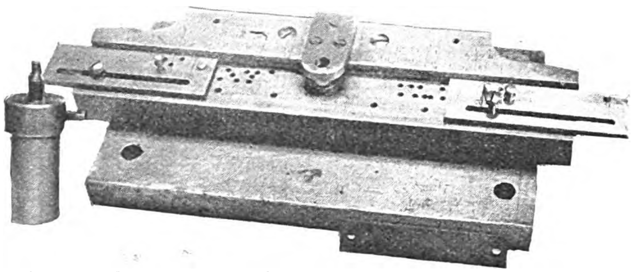

Fig. 12. The Holes in Various Types of Controller Cylinder Segments Are Located in This Adjustable Jig

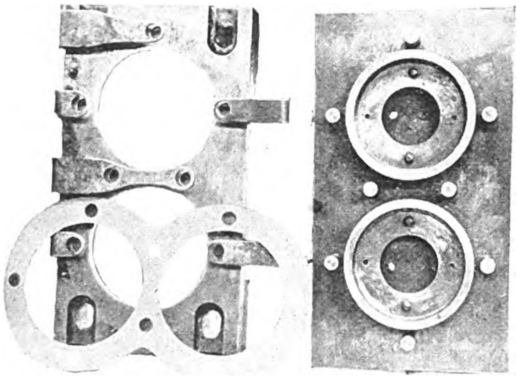

Fig. 13. Compressor Cylinder Head Gaskets Are Punched from Several Thicknesses of Material

exactly with the center line of the punch (*e*). When the work is moved, so that the end of this pointer coincides with the center punch mark locating the hole to be made, the punch itself will descend in the proper position. The pointer in the die is carried on the end of a cross slide having a slot near the rear end at (*b*). This slide is normally held in the forward position against a stop by the spring (*c*) which is stretched across the back of the die, and presses against the slide. A wedge (*d*) carried on an extension back of the punch enters the slot (*b*) as the punch descends and forces the slide back so as to move the pointer out of the way while the hole is being made in the material. As soon as the punch is again raised the pointer (*a*) returns to its normal position and is ready to locate the next hole.

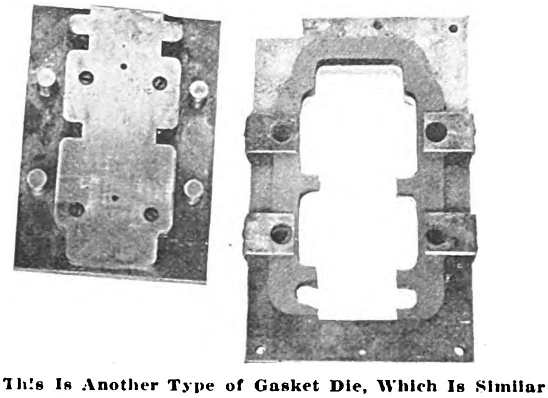

Fig. 14. This Is Another Type of Gasket Die, Which Is Similar in Construction to that Shown in Fig. 13

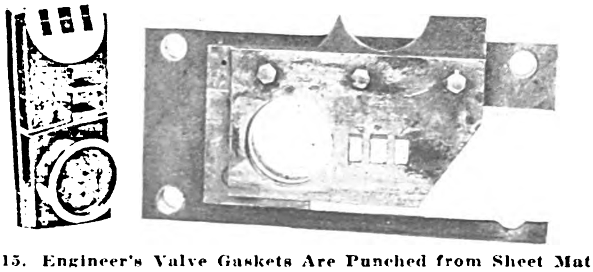

Fig. 15. Engineer's Valve Gaskets Are Punched from Sheet Material in a Continuous Process. The Punch Is Made in Two Parts So that Each May Be Used Separately if Desired

To make up different dies or jigs for each of a large number of similar parts which vary slightly in size and position of holes becomes a very expensive matter. In Fig. 12 is illustrated an adjustable jig which is indexed so that a comparatively large number of similar parts of varying dimensions may be all punched on the same piece of equipment. This is used for punching the holes in controller cylinder segments before they are formed. Pins in the slides at each side of the jig are dropped into holes corresponding to the positions indicated by the various scales which are laid out to locate the holes for various types of controllers. In this one jig all the various plates used on K-51, K-35 and K-28 controller cylinders are punched. The hole at each end of the piece is punched separately, the right and left hand sides being adjusted so that the piece is moved first to one side and then to the other. The work is done at the rate of about 1,000 pieces per hour in the V. & O. Press Company No. 21 power punch press.

Three different dies for punching gaskets are illustrated in Figs. 13, 14 and 15. The one shown in Fig. 13 is used to punch the bolt holes and the inside contour for compressor cylinder head gaskets after they have been blanked out on another die. That shown in Fig. 14 is very similar and is used for the outside cylinder head gasket. The equipment in Fig. 15 punches engineer's valve gaskets from strips of material in a continuous process. The three rectangular holes are punched in the piece first and the gasket is then blanked out on the second descent of the punch, while at the same time the holes for the next gasket are being made. The punch is made in two parts so that one or the other part may be removed and the tool used for either operation separately. All three of the dies shown in Figs. 13, 14 and 15 are used on the V. & O. Press Company No. 21 punch press. The cylinder gaskets are made at the rate of about 500 per hour by using several thicknesses of material at a time, while the engineer's valve gaskets are turned out at the rate of approximately 3,500 per hour.

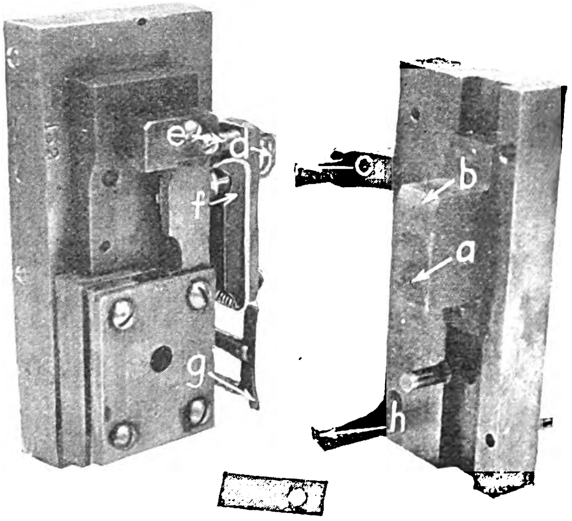

Fig. 16. The Controller Finger Part Shown at Bottom Is Punched and Formed from Brass Strips of Proper Width. An Ejecting Device Removes Finished Piece as Punch Is Raised

In Fig. 16 is shown an ingenious arrangement for ejecting a small piece of work after it has been punched out and formed. By thus automatically ejecting the completed pieces the production is very materially increased, as the material is fed in continuously and the

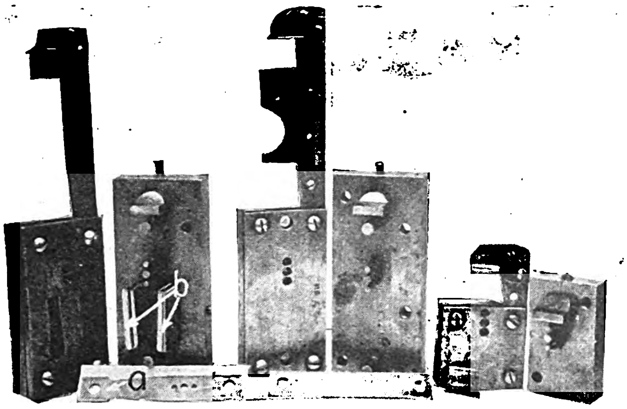

Fig. 17. Several Types of Forming and Punching Dies Are Used for Making the Various Parts of Controller Fingers

press operated at top speed. The part manufactured consists of a small brass strip, slightly curved at one end and having a hole punched near the other end, as shown near the bottom of the illustration. This is one of the pieces making up a controller finger assembly and is manufactured from strip brass of the proper width and thickness.

As the material is fed into the die the hole is punched first and the piece is then cut off to the proper length and formed to the proper shape while the hole is being punched for the next piece. The cutting edge is at (*a*) and the forming die at (*b*). After forming, the completed piece is left in the bottom of the die and it is necessary to eject this before the next piece is cut off. As the punch descends, the finger (*c*) enters the opening at (*d*) to force the U-shaped ejector out of the way of the forming punch (*b*). As this ejector is moved back the small spring (*e*) is compressed and the latch (*f*) drops into a notch, thus holding the ejector back in position. While the above action is taking place the hook (*h*) slips below the secondary latch (*g*). The piece of work, in the meantime, has been cut off and formed and lies in the bottom of the die. As the punch ascends again the hook (*h*) trips in turn the secondary latch (*g*) and the latch (*f*), releasing the ejector (*d*), which, under the action of the spring (*e*), snaps the completed piece out of the bottom of the die. The operation is repeated as the punch descends on each stroke. These pieces are made at the rate of 3,000 per hour in the V. & O. Press Company No. 21 press.

A group of three dies used for forming the various parts of K-35 controller fingers from strip brass and bronze is shown in Fig. 17. The completed pieces are illustrated at the bottom of the illustration. In addition to cutting off and punching, the die at the left also cuts the outside contour of the piece to the proper shape as shown at (*a*). This cut is made by the cutting edges (*b*) on the punch at the same time that the holes are being made. All of these parts are made continuously from strips of material fed into the dies and a production of approximately 3,000 per hour is obtained in the V. & O. Press Company No. 21 press.

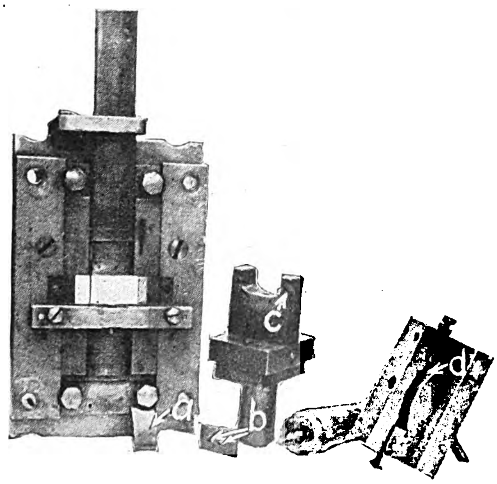

Fig. 18. Short Controller Segments Are Sheared from Formed Copper Bars and Holes Are Punched Radially in Die Shown at Right

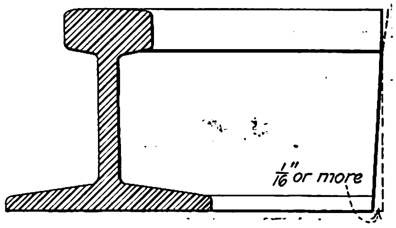
Short controller cylinder segments are cut with the equipment shown in Fig. 18 from copper bar formed to the proper contour. The pieces for the segments are sheared from the formed bar with the punch and die shown at the left of the illustration. At the right is an interesting type of die used for punching the two holes in these pieces. The holes must be radial rather than parallel, and in order to accomplish this the piece is moved first to one side and then to the other in the curved slot in the die.

Keeping Rail Ends in Contact

Milling in a Plane Perpendicular to the Longitudinal Axis, and Undercutting the Web and Base to Produce Better Joints

EXPERIENCE has shown that in order to avoid having open joints at the running surface of the rail head, it is frequently necessary slightly to undercut the end of each rail. Otherwise, variations in the accuracy of the cutting of the rails, or in the grade or alignment of the track, may cause the rails to touch at the bottom and be open at the top. If rails are undercut in this manner, however, and the top edges only are in contact, then when wear takes place, the rail ends are no longer in contact.



Method Developed by Third Avenue Railway for Finishing Rail Ends

To overcome this difficulty a special method of finishing the rail end has been designed by E. M. T. Ryder, way engineer Third Avenue Railway. According to his plan the end of the rail is undercut, preferably to a greater extent than in standard practice. The head of the rail is then milled or otherwise cut to a plane which is perpendicular to the longitudinal axis of the rail. The ends of the heads of two adjacent rails are brought into contact, and as the area in contact is only 1 in. or 1½ in. in depth, and about one-sixth the depth of the rail, a slight variation, either due to error in cutting or grade or alignment in laying the rail, would be negligible, and the heads of adjacent rails would still be in substantial contact throughout.

In fact, variation in width of the head and lip would be more likely to be material than would variation in depth. Such variation in the width, however, can to a considerable extent be taken care of during the operation of laying the track, as a saw cut can be made between the lips of the adjacent rails if necessary, or between the outsides of the heads, thus leaving a limited area at the end of one rail which is in contact with the corresponding area of the adjacent rail.

A patent has been granted Mr. Ryder covering this method of finishing rails.

Experience with Bolted Joints in San Francisco

Among 16,000 Joints of This Type Installed by the Market Street Railway During the Past 13 Years the Only Failures Have Been a Few Broken Rail Ends—Redwood Ties on Rock Ballast Are Used with Concrete Stringers Under the Rails

SINCE 1911 the Market Street Railway, San Francisco, Cal., has been making extensive use of bolted track joints. Among more than 16,000 such joints that have been installed the only failures during this period have been the breaking of 16 rails through the bolt holes. The track structure is of the ordinary type, in which rock ballast and wood ties are used, but special care is exercised in making the joints. Subsoil conditions vary widely in different parts of the city, ranging all the way from soft mud to rock.

In the lower business district the land has all been made artificially by filling in the shallow parts of the bay. The soil underneath the fill is a peculiar soft mud, and in many places it settles at a rate of about 0.1 ft. per year. Reference to this was made in an article published in ELECTRIC RAILWAY JOURNAL, issue of Dec. 23, 1922. This layer of mud is often as much as 300 ft. in thickness, and no matter what type of track construction is used both it and the entire street settle at a more or less uniform rate.

Outside the area of made land, which extends about ½ mile back from the waterfront, the subsoil is sandy in many places. In other districts, a soft shaly rock is found. Adobe loam and ordinary silty loam are present in certain localities.

Where any kind of rock is present the railway uses only enough ballast to be able to tamp thoroughly. In all other cases 9 in. of crushed stone ballast is placed under the ties. The latter are of redwood, 6 in. x 8 in. x 8 ft., spaced on 2-ft. centers. Rails are Lorain Steel Company section 106-422 and section 121-519. Round 1-in. tie rods are placed 8 ft. apart. The rails are spiked to the ties and in some cases tie plates are used.

A concrete stringer between the ties supports the rail. Concrete is used also as a paving base. On some streets 8-in. stone blocks are laid at right angles to the rail on top of this base. Elsewhere the blocks are omitted, the concrete is brought to a higher level and topped by a 2½-in. coating of asphalt.

The standard joint now being installed has two Lorain bridge type splice bars for 9-in. rail. These are held in place by 12 bolts of 1-in. diameter. All joints are installed by the same crew, consisting of a foreman, who has been in the employ of the railway for many years, and three or four other men. The head bonder has also had long experience at this work, and the remaining men are laborers who have been trained to install joints and do nothing else.

Brazed concealed bonds are first installed. Before fastening the plates, the rails are butted together as closely as possible. Then the plates are put on and bolted, six of the bolts being inserted from one side of the rail and six from the other side. In tightening them sledgehammers are used on the heads and on the plates to drive the latter in to make a perfect fit. In this way, if there is a slight inequality in the fishing sections of the rail, the plate is driven in and made to fit the inequality. The bolts are then tightened again by means of a long-handled wrench.

Cars are permitted to run over the new joints and for several days after the first installation the track gang is kept busy tightening the bolts. This is done five or six times and is repeated immediately before the street is paved, so as to insure that all bolts are snug before concrete is placed around the plates. The head of the rail is then planed with a Vixen planer, so that there shall be no unevenness in the running surface. In a comparatively short time after the rail has been planed and placed in service there is nothing to show the existence of the joint except on the flange side, which has not been affected by wheel passage

With joints constructed in this way, the railway believes that there is little chance of cupping. If cupping should develop, however, the joints are immediately ground smooth. It is thought that cupping at the joints loosens the bolts rather than that loosening of the bolts causes cupping. Experience in San Francisco indicates that so long as proper attention is given to keeping the rail head smooth the bolts do not become loose.

Traffic is extremely heavy on a number of lines where these bolted joints are used, the rush-hour headway being as short as 10 seconds. On other lines, the traffic is not so heavy, but only in a few cases is the headway as long as 5 minutes.

The accompanying illustrations show a number of joints after being subjected to varying amounts of service. No. A-1 to A-4 were taken on Mission Street in the summer of 1921, after the track had been in service about a year. At that time approximately 155,000 cars weighing 28 tons empty had passed over this track. The same joints were photographed again in September, 1924, as shown in No. B-1 to B-4, after 690,000 car passes.

A joint installed in April, 1916, near the intersection of Folsom and Second Streets was photographed on April 7, 1921, as shown in illustration A-5, after the passage of 210,000 cars weighing 26 tons each. When the second photograph B-5 was taken in September, 1924, the joint had had 346,000 car passes.

So far, it has been necessary to grind down the joints on only a few lines, and in these cases the joints had been made from 10 to 14 years ago and had not been planed at the time of their original installation. Since the Market Street Railway has been using the present standard bolted joints, there have been 16 failures due to broken rail ends. In all of these cases it was discovered that there had been a crack in the rail through the bolt holes. Except in these instances, it has not been necessary to open up any of the joints, either to tighten the bolts or to insert a section of new rail.

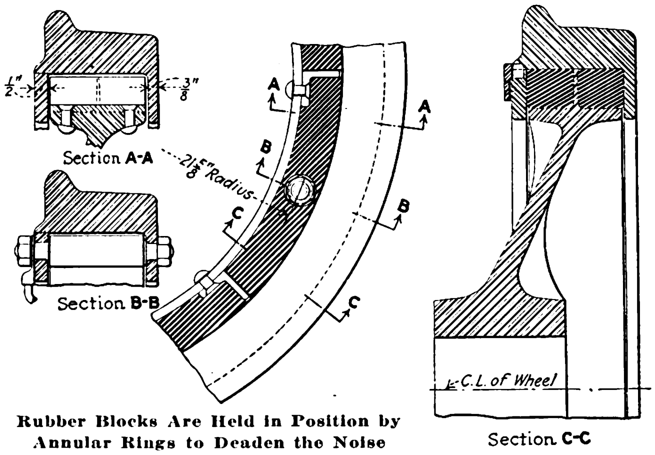
Cushion Wheels Tested to Reduce Noise

Rubber Insulated Rims Are Being Tried Out in Oil City, Pa.—The Results So Far Secured Have Been Encouraging

By JOHN A. DEWHURST
Day & Zimmermann, Inc., Engineers, Philadelphia, Pa.

THE desirability of eliminating noises in street car operation was emphasized in the report of the 1923 American Electric Railway Engineering Association committee on car design. With this end in view, a trial set of cushion wheels has been put in operation on the lines of the Citizens Traction Company at Oil City, Pa., and is now on test on one of the standard safety cars.

This type of wheel has been in use in gasoline railcar construction for about 3 years, but to the knowledge of the writer this is the first application of this type of wheel to an electric car. The early observations indicate that, while the noise is not reduced to a minimum, the cushion wheels have materially helped to deaden the sound of the rail and wheel contact.



Rubber Blocks Are Held in Position by Annular Rings to Deaden the Noise in This Cushion Car Wheel

One of the most unfavorable points of comparison between the electric car and almost any form of automobile transportation is that of noise. Even a perfect steel wheel rolling against a perfect steel rail will produce a certain amount of noise that cannot be avoided. Add to this condition a little dirt on the track, a few loose joints, or a rail that is partially scored or worn, and the noise is very greatly increased. However, the noise produced between the wheel and the rail is not the only source which exists in street car operation. Loose brake rigging, the action of brakeshoes against the steel wheels and worn gears will add materially to this unpleasant feature and oftentimes produce a very irritating condition. The general public is so used to the noise accompanying street car operation, especially on hard paved streets, that it sometimes does not arouse as much criticism as in many cases is warranted.

The accompanying illustration shows the construction of the cushion wheel, which is designed to reduce the amount of noise occasioned by the ordinary electric car operation over the average track. The wheel has a cast-steel hub which is machined exactly as is the hub of a rolled-steel wheel and is pressed on the axle. The periphery of this cast-steel center, as shown in the diagram, is machined to contain a set of rubber cushions, one set placed on either side of the center web in blocks about 8 in. long around the entire wheel. The rolled-steel tire is then pressed on with a light pressure, being held firmly in place by the through bolts.

When the steel rim is in place, it rests snugly against the rubber inserts, but the steel flange on either side does not quite come in contact with the cast-steel center, there being a space of about $\frac{1}{16}$ in. The through bolts are really a part of the rolled-steel rim and do not come in contact with the steel center but hold the steel rim in place through the agency of the center web cast on the wheel center.

The driving action of the motor is transmitted through the cast-steel center and into the rim through the agency of short angles, which are riveted to the steel center and rest against the ends of the rubber blocks, the driving action passing lengthwise through the rubber blocks to the bolts and hence to the steel rim. Under extreme conditions for this type of car, the pressure passing through the rubber does not exceed 100 lb. for each bolt. The rolled-steel rim is so thoroughly insulated from the steel center that it is necessary to use a flexible copper bond between the two elements of the wheel in order to complete the return circuit to the rail.

The rubber inserts are constructed especially for this purpose and are of a very high-grade, soft, pliable gum rubber, similar in general composition to the rubber inserts used in the Mead cushion wheels; in fact, they are manufactured by this concern.

Besides the noise-reducing qualities of this type of wheel, it is expected that the slight give of the steel rim with respect to the wheel center will tend to reduce very materially the flange wear in special work occasioned in going around curves of short radius. If the wheel flange wear is reduced by this means, it also follows that the rail wear should be reduced on curves and in special work likewise.

Besides this test at Oil City, there is also a set about to be put in operation in Zanesville, Ohio. An additional set for a double-truck car is being constructed for the York Railways at York, Pa.

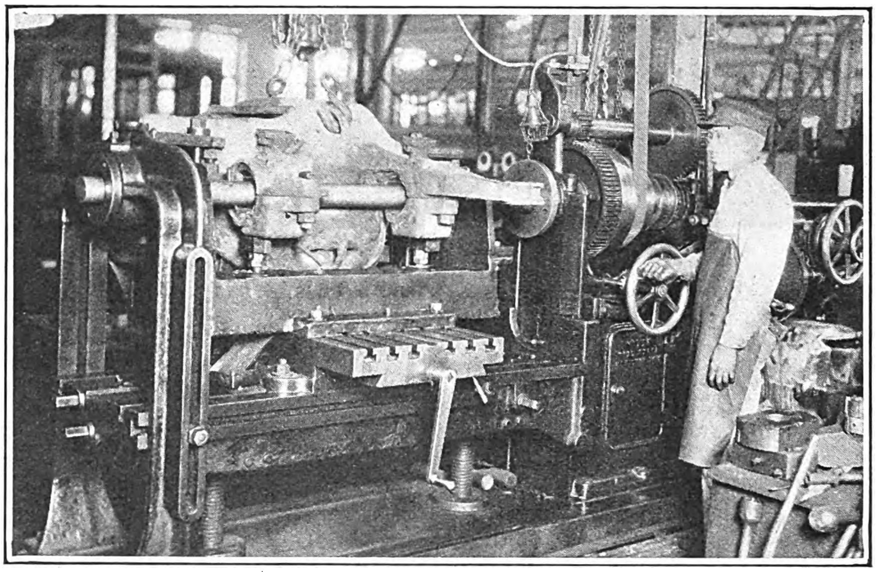
Improving Railway Motor Bearings

By Reboring Motor Frames to Make an Accurate Fit for New Simplified Housings and Improved Bearings the Public Service Railway of New Jersey Has Reduced Motor Troubles and Cut Bearing Maintenance Costs



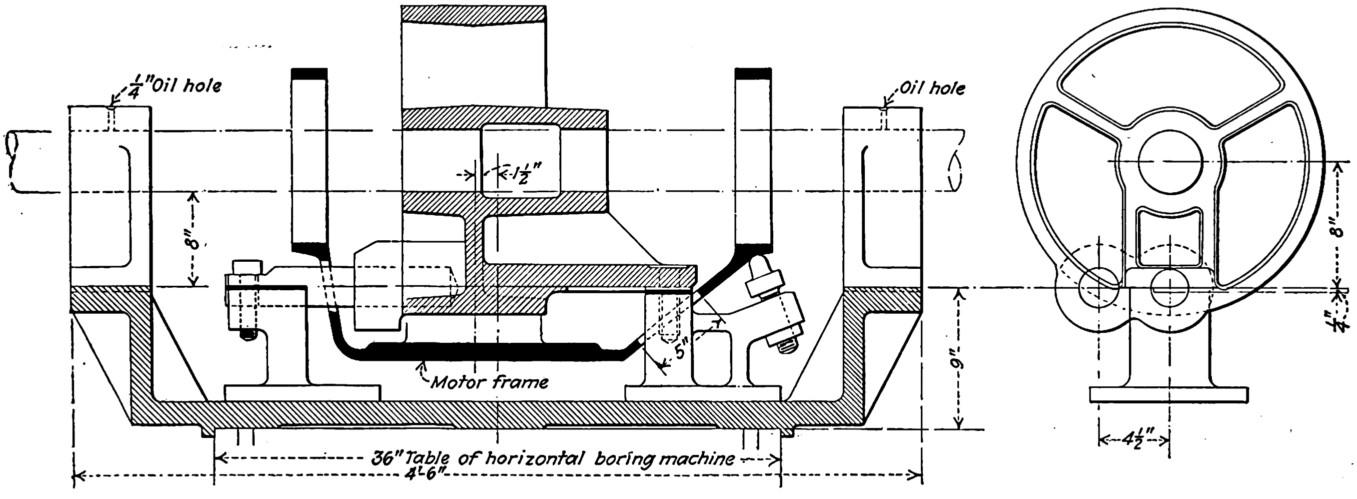
Reboring a Westinghouse Type 101-B-2 Motor Frame in the Newark Shops of the Public Service Railway

AN ELABORATE program of rehabilitation of the older types of railway motors is being carried out by the Public Service Railway of New Jersey at its Newark shops. This consists of a complete change of the end housings and bearings, both armature and axle, on some motors, and on all others changes to provide for bronze bearings with thinner walls and the use of a new system of lubrication. Up to Nov. 1 of this year approximately 5,000 motors had been revamped, including Westinghouse types 68, 101-B, 101-C, 307 and 514 and General Electric type 80-C. Other types which will be remodeled in the near future include the Westinghouse 93, 310 and 508.

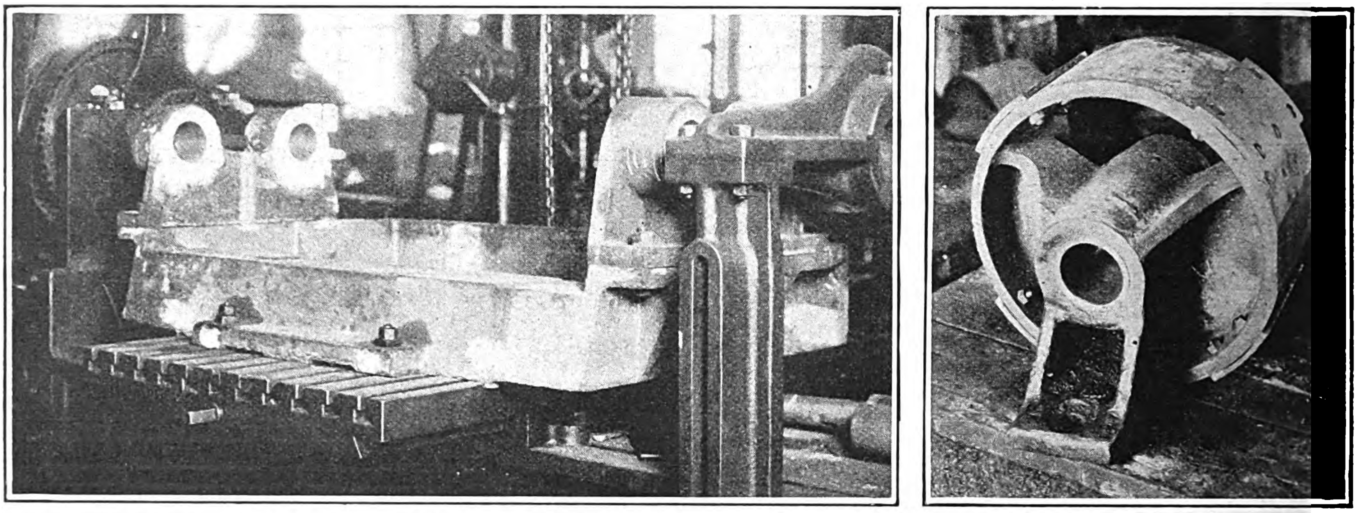
The tap bolts used to retain the armature housings on certain types of railway motors have always given much trouble due to their working loose in service. This looseness has caused wear on the outside of the housing, on the inside fits of the motor frame, and in wearing away of the threaded holes in the housings themselves. The result has been the loss of the clamping action of the two halves of the motor frame on the housing. Naturally the wear on other parts has been excessive, and the maintenance costs have been correspondingly high. The parts affected include armature windings, brush-holder parts and carbon brushes, as well as the bearings and housings.

For revamping the motors a through-bolt type of bearing housing has been designed. This is considered a great improvement over the old tap-bolt type, which had to be replaced on the average every 5 years. A new system of lubrication is being installed and other changes are being introduced. An entirely new type of housing is being used in the Westinghouse 101-B and 514 motors. All the other types used by the company are having the necessary changes made to install the new system of lubrication and to provide for bronze bearings with thinner walls than those previously used. The axle bearing caps and fits for the axle bearings in the frame also are being changed to make a more satisfactory design. The new design of housing used by the Public Service Railway is simplified and of lighter weight, requiring less care and expense in casting. Provision has been made for use of lighter weight bronze bearings and Rico vacuum oilers, giving a great reduction in the quantity of waste necessary for packing and maintaining the bearing lubrication.

Among the motors being revamped are both split and box-frame types. Some have armature bearing hous-



Set-Up and Jig Used for Reboring Westinghouse 101-B-2 Motors



At Left, Frame of Jig Used for Holding Westinghouse Type 93 Motor During Reboring. At Right, Drum for Lining Up Bearing Fits from the Pole Face Seats of Motor Frame

ings and others are without them. The work necessary with the different types varies, and the changes as made will be outlined for a representative motor of each class.

As an example of the work done on a split-frame motor with armature bearing housings, a housing of entirely new design has been provided for the Westinghouse type 101-B motor. In order to take up the wear in the housing fits of the motor frames, these are rebored to a diameter $\frac{1}{16}$ in. greater than standard, and the outside diameter of the fit on the housing is made larger than the original housing by $\frac{1}{16}$ in., plus from 0.002 to 0.006 in. The waste chamber and the oil pocket in the original design have been done away with. Instead provision has been made for a Rico vacuum

Changed Housings and Bearings Compared with Old Types

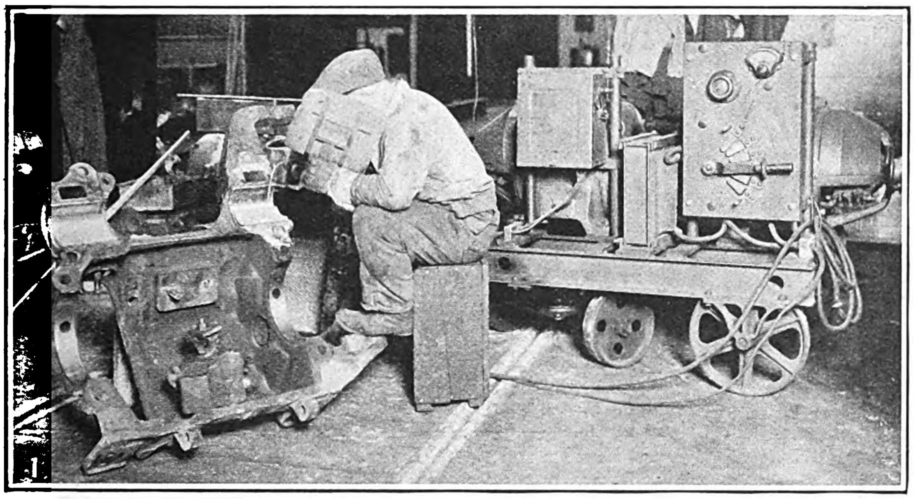
No. 1. New housing and bearing for Westinghouse type 307 motor with pile of waste used for packing.

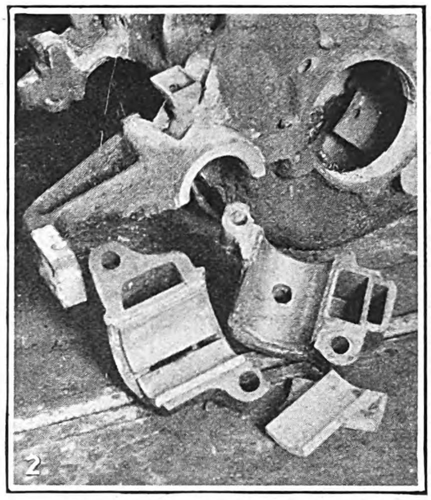
No. 2. Old housing and bearing for Westinghouse 307 motor with waste packing.

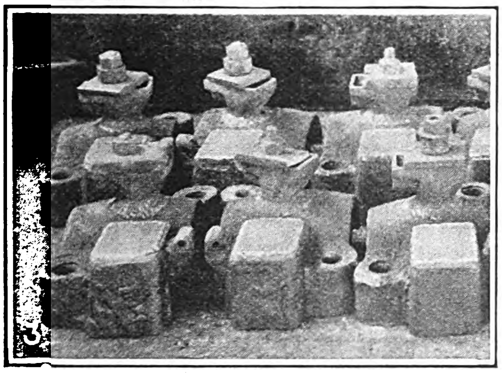
No. 3. Old and new axle bearings used with Westinghouse type 101-B motors.

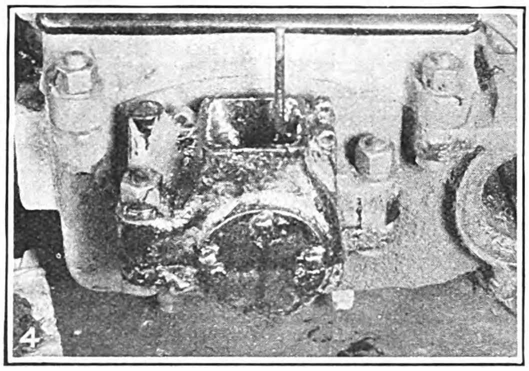
No. 4. Old and new axle bearings used with Westinghouse type 68 motors.

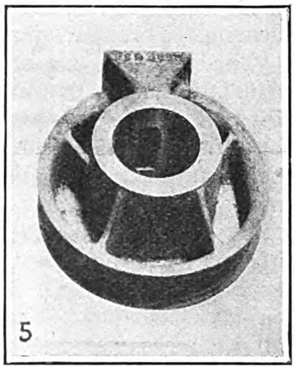
Nos. 5 and 6. New and old arrangement of axle bearings for Westinghouse type 514 motor. In the new position shown in No. 5 the split for the bearing halves has been rotated from that used with the old construction to bring it horizontal.











Welding Operations Constitute an Important Part of the Rehabilitation Work

No. 1. Welding plates in the frame part of the axle bearing fit for a Westinghouse 101-B-2 motor.

No. 2. Plates are welded into the axle cap and frame of 101-B-2 motors to reduce the diameter of the bearing fit. At left, axle cap with plates welded in position. At right, finished axle cap. In front at bottom, plates used for welding in.

No. 3. Pile of Westinghouse 101-C axle caps with waste opening welded shut and adapter welded in place.

No. 4. Plates are welded into the waste opening of the General Electric type 80-C armature housing to form a V leading down to the window of the bearing.

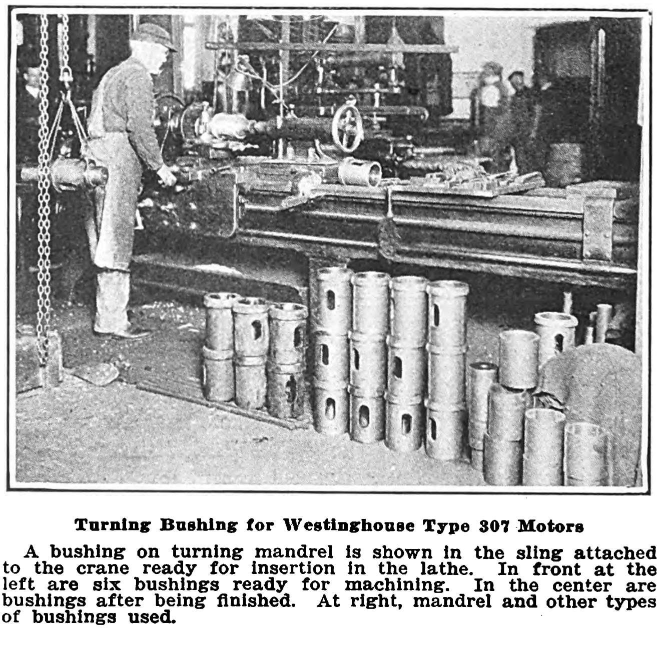
No. 5. New armature housing for Westinghouse 101-B motors.

oiler with a much smaller waste opening located directly on top of the shaft. The size of window in the housing itself has been decreased from $4\frac{11}{16}$ in. x $5\frac{3}{8}$ in. to $1\frac{1}{8}$ in. x $3\frac{1}{2}$ in., with a corresponding decrease in the bearing window. The bore of the housing into which the armature bearing is pressed has been decreased from $4\frac{7}{8}$ in. to $4\frac{1}{8}$ in., giving a corresponding decrease in the thickness of the bearing walls. Provision is made for the through-bolt type of fastening. Other simplifications in construction will be evident from the accompanying illustrations. The amount of waste required with the new housing is a handful as against 1 lb. with the old type.

THREE DIAMETERS OF SHAFTS PROVIDED FOR

For the 101-B motor, bearings are bored out to three standard sizes, which are the same for both pinion and commutator ends. These bores are $3\frac{1}{4}$ in., $3\frac{3}{16}$ in. and $3\frac{1}{8}$ in. inside the babbitt lining. As the outside diameter of the bearing is $4\frac{1}{8}$ in. plus the allowance for pressed fit, the thickness of wall for the $3\frac{1}{4}$-in. bore is but $\frac{3}{8}$ in. The bearings for the old-style housing with the $3\frac{1}{4}$-in. bore had a $\frac{3}{4}$-in. wall, so there is a reduction in thickness of the bronze of 50 per cent. The weight of an old 101-B pinion end bearing was 24 lb., while the new bearing weighs but $13\frac{1}{2}$ lb. The lubrication system now used has permitted a decreased size for the windows. For the commutator end, 101-B bearing, the window opening is 1 in. x $3\frac{1}{4}$ in., and for the pinion-end bearing 1 in. x $3\frac{1}{2}$ in. The window is beveled, so that the narrow dimension is $1\frac{1}{4}$ in. at the outside diameter. The old bearings have a window opening at the inside bore of the bearing of 4 in. x $2\frac{1}{4}$ in. for the commutator-end bearing and $4\frac{5}{8}$ in. x $2\frac{1}{4}$ in. for the pinion-end bearing. An increased bearing surface is thus provided in the new bearings which results in increased life.

The armature bearings used with the new housings are of bronze with $\frac{1}{16}$-in. babbitt lining. The com-



Turning Bushing for Westinghouse Type 307 Motors

A bushing on turning mandrel is shown in the sling attached to the crane ready for insertion in the lathe. In front at the left are six bushings ready for machining. In the center are bushings after being finished. At right, mandrel and other types of bushings used.

positions of the metals for the shells and linings are as follows:

COMPOSITION OF BEARING SHELLS AND LININGS, PER CENT

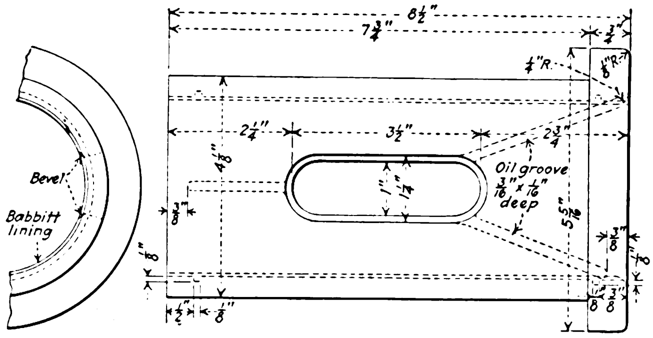
	Bronze Shells	Babbitt Linings
Copper	77	2 (Lake)
Tin	8	90 (Straits)
Lead	15	....
Antimony	..	8

For the shells a variation of 10 per cent is allowable in the tin or lead, with a maximum impurity of 1 per cent. It is considered essential, to get good results, that only Straits tin and Lake copper be used in the babbitt lining.

An accompanying illustration shows the new design of armature bearings. Two oil grooves run from the window toward the flanged end of the bearing, one going entirely through, so as to lubricate the flange. One groove runs toward the outside end of the bearing. An accompanying illustration also gives the finished bearing tolerances allowed.

The pressure required for pressing bearings into housings runs between 4 and 5 tons. The reduced size for the waste-window opening has done away with buckling and distortion of the bearings while they are being pressed into the housing, giving a tighter and more even fit. No keys are used, but the bearings remain tight. Records show that after 100,000 miles of operation the pressure required to remove this new type of bearing from the head is far greater than with old-type bearings. There is better distribution of the oil with the waste window at the top of the bearing and the danger is eliminated of oil running between the bearing and the head, as in the older type. The waste is held in close contact and cannot fall away, and as it is continuously saturated with clean oil, glazing is eliminated. The necessity of inspecting the waste, teasing it, or repacking the bearing is thus done away with.

Another advantage found with the top feed bearing is the uniform use of oil. With side-feed bearings, the amount of oil delivered to the waste at the window depends upon the distance that the oil is lifted. In an article by C. Bethel in the ELECTRIC RAILWAY JOURNAL for April 19, 1924, the maximum lift for safe oil supply was given as about 3 in. and the minimum lift for reasonable economy as ¾ in. A variation from ¾ in. to 3 in. in the lift of the oil was also shown to cause a variation of 8 to 1 in the oil feed. With waste-feed lubrication, oil is used again and again, sometimes after its lubricating value has been destroyed through accumulation of foreign material. With the top-feed bearing the oil passes through the bearing but once.



New Armature Bearing Construction Used for Westinghouse Type 101-B-2 Motors

Axle bearings of railway motors are held tight by the clamping action between the axle caps and the frame. In addition, they are kept from turning by dowel pins or keys. The axle bearings for the 101-B motor used by the Public Service Railway were reduced in size from 6 in. outside diameter by 4½ in. bore to 5¼ in. outside diameter by 4½ in. bore. The thickness of the wall was thus reduced from ¾ in. to ⅜ in. No lining is used in axle bearings and the composition is the same as for armature bearings. The improved lubricating system permitted the axle bearings to be split in a horizontal line. The window is in the center of the upper half, while the lower half is solid.

Tolerances for Finished Axle and Armature Bearings

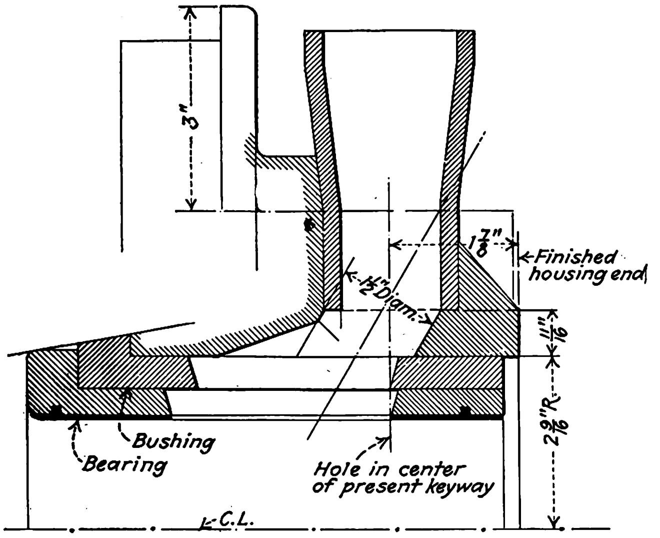
The window opening in the old bearing was 3⅞ in. long and occupied an angle of 90 deg. in the half bearing. The new bearings have windows 2⅞ in. long by 1¼ in. wide. The original bearings had a 13/16-in. dowel hole in the half containing the window. The new design provides two 31/32-in. dowels in the solid bottom half of the axle bearing. Two oil grooves are used in the upper half of new bearings. Many of the advantages of the new design of armature bearing also apply to the new axle-bearing construction. Placing the split in such a position that the wear will not come at that point is an advantage. The relocating of the bearing also gives more metal around the dowel holes.

To reduce the size of the opening in the motor frame and axle cap four steel plates are welded in for each bearing opening. Two are in the motor frame and two are in the lower half or axle cap. The space at the edges of the plates and between them is then filled in with the electric arc, after which the opening is ready to be bored out to size. On 101-B motors, the adapter for the new oilers is welded to the motor frame, so as to come on top of the axle bearing. This adapter also provides the opening for the waste and for lubrication to the bearing. The original opening through which the waste was inserted for packing is welded shut, eliminating the covers and any danger of water entering, due to loose or chattering covers.

In addition to the 101-B motors, the Public Service

Railway also has a number of 101-C motors. These have a somewhat different axle-bearing arrangement. In the latter type the adapter is welded into the axle cap and a sheet-iron cover is welded on to close the original waste opening. Accompanying illustrations show the two types and the various methods of welding required.

The work of reboring motor frames, which follows the welding, is carried out on a single-spindle horizontal boring mill. The Newark shops of the company have two of these machines, one being a Niles mill and the other made by the Betts Machine Company. The jig used in connection with this reboring is an important part for securing accuracy of the work as well as speed. Two men with one of these machines will rebore eight motor frames in 24 hours.



Method of Applying Bushings to the Housings of Westinghouse Type 307 Motors

The jig, which is shown in an accompanying illustration, consists of a heavy iron casting with lugs on the base for supporting the motor frame and uprights at each end, with holes through which the boring bar rotates. The centers for reboring the armature and axle fits are obtained from the pole face seats. The lining up from the pole seats is obtained by means of a large drum mandrel which fits inside the motor and has plates on the outside to fit against the pole faces. It is shown in an accompanying illustration. By varying the thickness of these plates, the same drum may be used for different types of motors.

One of the supporting brackets for the motor frames has an extension which passes up through the bottom hand hole of the motor frame. The top of this extension is used for bolting the central drum in position. Various screw adjustments on the jig provide for rapid adjustment of the motor frame when it is once set. The central drum, together with the end support for the boring bar used to bore out the armature housing fits, provides for accurate location of this from the pole face seats of the motor, and the bearings for the boring bar which bores out the axle bearing fit are accurately located from these. The boring bar has two cutting tools, so that two armature housing fits or two axle bearing fits are machined at the same time. In reboring, a rough cut and a finishing cut are taken. Setting up a motor for reboring takes about one-tenth of the total time required for the entire finishing operation. Both boring mills are served by jib cranes, which are of material assistance in handling the work and heavy parts of the jigs and in adjusting the motor shells for reboring.

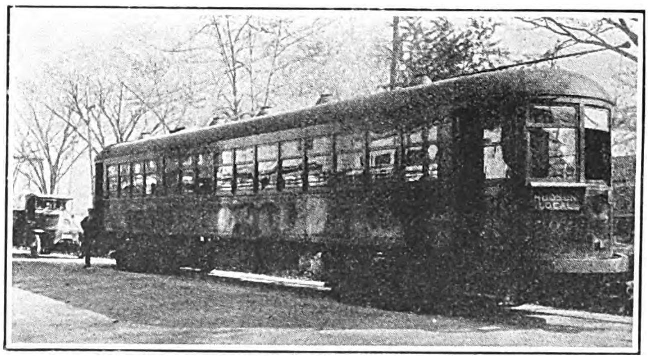
PROCEDURE ON BOX FRAME MOTORS

The work done on box frame motors is essentially the same as for the split-frame Westinghouse 101-B motor. Several of the illustrations show various details used with the Westinghouse 307 and 514 types, which are both box frame motors. In some cases variations in design make necessary some different methods. The General Electric type 80-C motor has the waste opening for the armature bearing on top. In this case two plates are welded into the opening so as to form an open-ended V with the narrow opening at the window of the bearing. The oiler is bolted directly to the top of the housing without an adapter, and the modified waste opening is used as a receptacle for the waste.

The original armature-bearing housings of the Westinghouse 307-CD-3 and CD-4 motors, which are of box-frame type, are used by pressing in steel bushings to reduce the size of the armature-bearing fits. An accompanying illustration shows the construction used. These steel bushings have a ½-in. wall so that the walls of the armature bearings are reduced by this amount. The old armature bearings were 5⅛ in. outside diameter. The new bearings are 4⅞ in. diameter, with an inside bore of 4⅛ in. The adapters for mounting the oilers are welded into the tops of the housings, and an opening is made in the steel bushing in line with the bearing window. In this case the work consists of boring out the housing and cutting a recess for the opening at the top, after which the adapter is welded in place and the steel bushing is pressed in. The work of machining the steel bushing is done on a small lathe, and the bushings are held by a special mandrel for turning.

Cars Operated Over New Concrete Roadbed in 26 Hours

THE use of Lumnite quick-hardening cement allowed the Albany Southern Railroad to operate heavy interurban cars over a new concrete roadbed in Hudson, N. Y., in a remarkably short time after its construction. The concrete was poured during the morning of Oct. 26, 1924. On the following morning, only 26 hours after pouring, a 32-ton interurban car was operated over this track. No damage whatsoever resulted to the pavement. Lumnite cement was used in this case because the route is one over which the interurban cars are scheduled on a comparatively short headway and it was desired to



This 32-Ton Interurban Car Was Operated Over a New Concrete Roadbed 26 Hours After Its Construction

reduce to a minimum the time the track was out of service.

Lumnite cement is made by the Atlas Lumnite Cement Company and is essentially aluminous. Its chemical composition is approximately silica, magnesia, etc., 5 per cent; alumina, 40 per cent; lime, 40 per cent, and iron oxides, 15 per cent. It is used in the same general way as portland cement, except that on account of its more rapid hydration slightly wetter mixtures are used. For several hours after setting the surface must be kept damp to prevent incomplete hydration.

While this cement develops at 24 hours a greater strength than ordinary cement develops in 28 days, it is not quick setting. It allows the usual time for mixing, transporting and pouring into forms, but after setting its early strength develops with great rapidity. These qualities are of special advantage in such cases as that occurring at Hudson, and a number of street railway companies are experimenting with this cement.

Steel Reinforcing Bar Sizes Simplified

THE Division of Simplified Practice of the Department of Commerce, through the unanimous action of a joint conference of representatives of manufacturers, distributors and users of square and round steel reinforcing bars, has promulgated a simplified list of recognized sizes for the purpose of eliminating a large number not in common use, as follows:

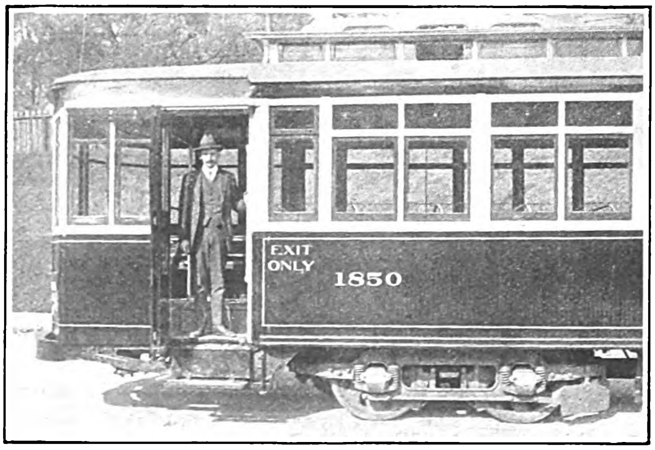
Area in Square Inches	Size in Inches	Style
0.049	¼	Round
0.110	⅜	Round
0.196	½	Round
0.250	½	Square
0.307	⅝	Round
0.442	¾	Round
0.601	⅞	Round
0.785	1	Round
1.000	1	Square
1.266	1⅛	Square
1.563	1¼	Square

This reduced list of sizes becomes effective as applying to new production Jan. 1, 1925, and will remain in effect for a trial period of one year, at the end of which time all interested organizations will be given an opportunity to suggest modifications or additions.

How Treadle Works on Toronto One-Man Cars

SINCE the publication in ELECTRIC RAILWAY JOURNAL for Nov. 8, 1924, page 799, of an article describing the automatic rear exit doors on Toronto rebuilt cars, additional information and photographs have come to hand. In the accompanying illustrations are shown the step from the rear platform down to the treadle, and the sign directing passengers who wish to get off the car.

Another picture shows a passenger standing on the treadle with the door in the open position, and the lower step down. A third picture shows the mirror fastened to the front door of the car in such a way that the motorman can see clearly the condition at the rear end of the car.



The Treadle Which Operates the Rear Exit Door Is 9½ In. Below the Level of the Rear Platform

The Readers' Forum

Both Babbitt and Tin Used for Thin Lining of Bearings

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

EAST PITTSBURGH, PA., Nov. 20, 1924.

To the Editors:

In the Oct. 25, 1924, issue of ELECTRIC RAILWAY JOURNAL, page 725, under the title of "Armature Bearing Practice for Railway Motors," there is a statement to which I wish to call attention. Quoting from the JOURNAL:

"There is, however, a decided tendency away from the babbitt lining for armature bearings. Motor manufacturers are now furnishing a bronze type of bearing with thin tin linings almost entirely with their new motors."

Regarding the above, it appears that this refers to axle bearings instead of armature bearings, as it is the practice of the Westinghouse Electric & Manufacturing Company, and I believe also of the General Electric Company, to use solid bronze axle bearings tinned. However, for armature bearings, bronze bearing shells with from a 1/16 in. to ⅛ in. lining of babbitt metal is considered good practice. JOHN S. DEAN,

Renewal Parts Engineer.

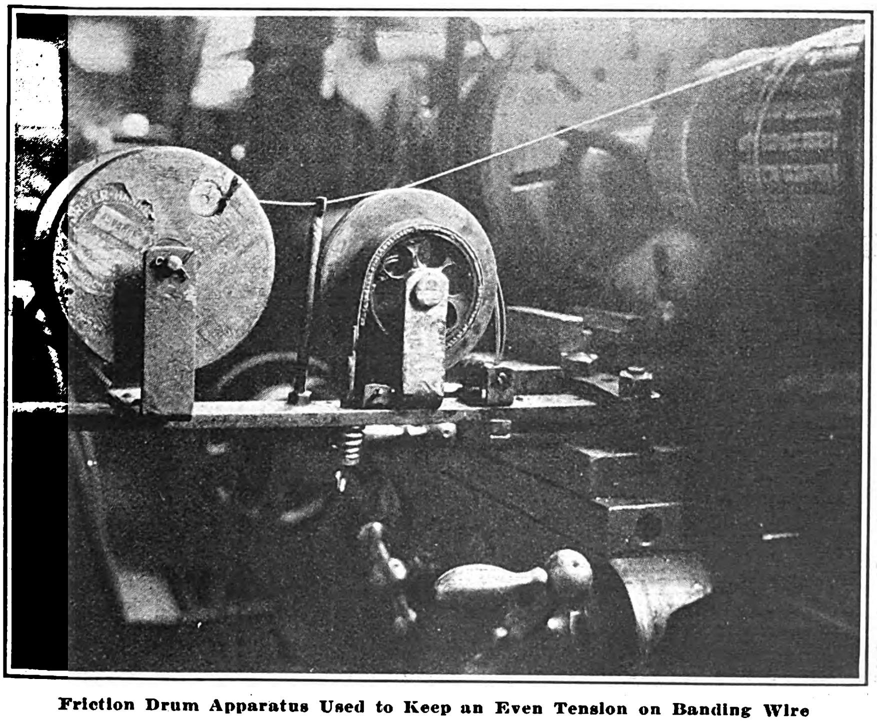
Equipment Maintenance Notes

Friction Brake Puts Tension on Banding Wire

A WINDING brake consisting of a grooved steel friction drum and a brake drum mounted on one shaft is used by the Gary Street Railway, Gary, Ind., to maintain a uniform tension on banding wire being wound on an armature. The banding wire passes around the grooved drum before it is fed to the revolving armature, while a lined metal band wrapped around the brake drums retards the rotation and applies tension to the wire.

The shaft is mounted on a U-shaped support, fastened to a steel bar, one end of which is bolted to the carriage of the lathe. Near the other end of the bar is a second support holding the wire reel. A light braking effect is used to keep the reel from spinning. Between the reel and the drums is a guide. This arrangement is shown below.

The friction drum has a diameter of 9 in. and is 1 in. wide, with five semi-circular grooves, of the same size as the banding wire, cut in the face. From the reel the wire passes through the guide and thence to the outside groove of the friction drum. It is carried around the drum four times, a small pulley being used to change the wire from one groove to the next. The brake drum is 1 in. wide but has a diameter of only 6 in. A brake band around this drum is fitted with ordinary automobile brake-lining material. One end of the band is attached to the supporting frame while the other is fastened to a threaded rod which passes through the horizontal supporting bar. The brake pressure is adjusted by means of a winged nut which rests against a compression spring at the threaded end of the brake band below the horizontal bar. This apparatus has been found very satisfactory to maintain a uniform tension in the banding wire.



Friction Drum Apparatus Used to Keep an Even Tension on Banding Wire

Bearings Rebored to Fit New Style Motors

AT THE time when the Eastern Massachusetts Street Railway decided to replace all of its type 67 motors by those of a newer model it had on hand a large number of armature bearings of the old design. In order to adapt these for use in modern motors it was decided to rebore them. The bearings originally designed for use on the commutator end of the No. 67 motor was rebored for use on the pinion end of No. 247 motors. The pinion end bearing of the old No. 67 motor was rebored for use on the pinion end of type 200-E motors. By this process the railway was able to obtain a year's supply of new bearings of types now needed.

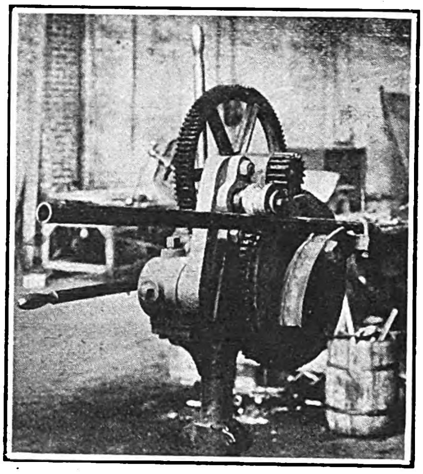
Pipe Bending Machine Built in Kansas City Shop

By John W. Hogan

Foreman Kansas City Railways

THE machine shown in the accompanying illustration was built in the shop of the Kansas City Railways for bending the larger sizes of pipe and conduit.

As shown in the illustration, the forming die is mounted on a face plate, hand driven through reducing gears by four long levers. The end of the pipe is slipped into a U clamp mounted at one end of the die. A small roller fastened to the frame of the machine holds the pipe in position as the face plate is rotated.



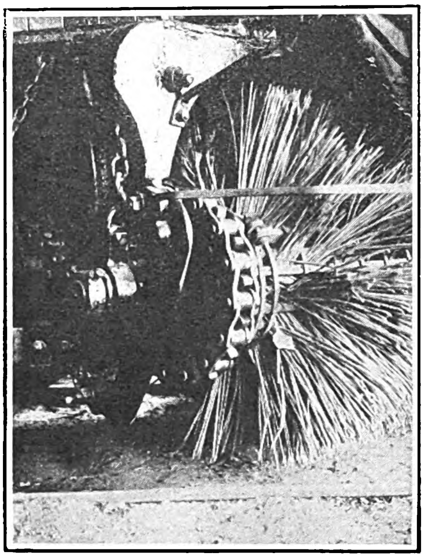
This Hand-Driven Pipe Bending Machine Built in the Shops of the Kansas City Railways Has Proved to Be a Valuable Time Saver on Large Reconstruction Jobs

Forms of various sizes can be used in connection with the machine, and they are inexpensive to make up. For conduit work it is, of course, undesirable to make bends of very short radius, due to the difficulty of pulling the cables into place. As used in the Kansas City shop, several different forms for the various sizes of conduits have been found particularly useful. This includes forms for making bends of 7-in. and 10-in. radius in 1-in. and 1¼-in. pipe, 7-in. and 14-in. bends in 1½-in. pipe, and 16-in. bends in 2-in. pipe.

On the larger overhaul and rebuilding jobs such as are undertaken in most electric railway shops this machine has proved to be a particularly valuable time saver.

Steel Roller Chains for Snow Sweepers

WHEN the snow sweepers of the Altoona & Logan Valley Electric Railway were overhauled last summer in preparation for the coming winter, steel roller chains to drive the brooms were installed in place of the old malleable-iron link chains. This was accomplished at small cost under the direction of C. E. Keefer, master mechanic. In the past, some trouble was experienced on account of breakage of the malleable-iron chains while the sweepers were at work. It is expected that the new chain will eliminate this trouble, and will last as long as the sweepers themselves. Another interesting point in connection with the overhauling of the sweepers is the fact that they were painted a bright red to increase the visibility.



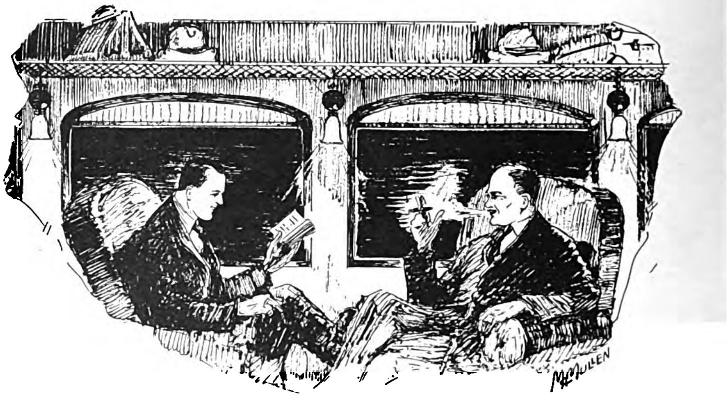
More Reliable Sweeper Operation Is Secured by Using Steel Roller Chains

Convenient Mounting for Pinion Puller

AN ARMATURE mounting used in connection with a pinion puller in the 39th Street shops of the New York Rapid Transit Corporation, Broklyn, N. Y., is shown in the accompanying illustration. The ar-

Dick Prescott Starts His Journey

And Rehearses Some Questions



AT LAST Dick Prescott, the newly appointed engineer of equipment of the Consolidated Railway & Light Company, and Steve White, the carpenter shop foreman, found themselves in the club car of the Limited bound for Centerville, the first stop on their trip of inspection. They had made out an itinerary and also had made up a list of things to go over on each property visited. Both Dick and Steve had carefully reviewed the files of ELECTRIC RAILWAY JOURNAL before starting. In that way they were able not only to select properties showing the most evidence of progressiveness, but also had found that the complete information available made it possible for them to concentrate on getting a first-class impression of how the new methods work out in practice.

"Well, Steve," said Dick, as they settled back on the cushions, "tomorrow we ought to have an interesting time out at the Centerville Railway shop." Taking a memorandum book from his pocket, he continued:

"I've made up a list here to use as a guide in asking questions about the work of the engineering departments. Here's some of them.

"How many men in engineering department?

"Is the policy to standardize parts and fittings used on cars?

"Do they have a drafting room?

"Are drawings made of standard patterns—and are they kept up to date?

"Do they make sketches for special jobs?

"Are limits of wear established for parts frequently renewed?

"Does the engineering department follow up the performance of parts put on cars for test?

"Are wiring diagrams and data put in convenient form for shop and carhouse foremen?

"Does the engineering department prepare specifications for new material?

"Does it co-operate with the storeroom and make drawings for ordering special parts?

"Does an inspector reporting to engineer of equipment determine if drawings are followed and if maintenance methods are up to the standard?

"Does it prepare estimate on cost of new work and issue storeroom requisition for materials on special jobs so that they can be ordered early enough to be on hand when wanted?

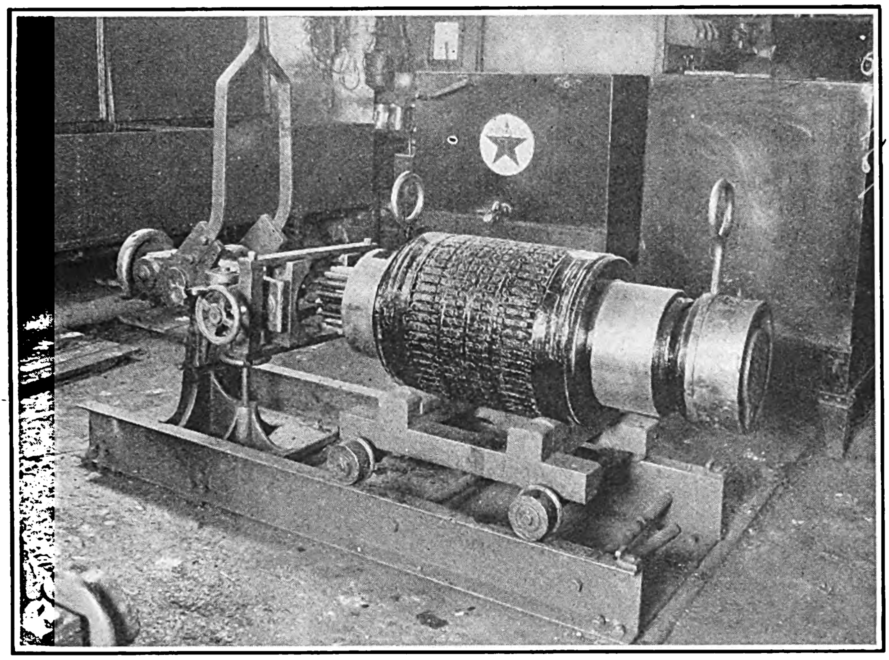
"Does it ...."

Then Steve interrupted. "Gosh, Dick, that list must be a mile long. You're way ahead of me. I can see you've put lots of thought in there and I want to go over your questions when we can discuss them more fully. You've got work enough laid out there to keep an engineering department busy for a long time."

"Of course I have, but I haven't even scratched the surface. Remember this, Steve. So far as I can see every one of those functions is being performed by somebody in every railway shop. If an engineering department doesn't do them, then somebody else who ought to be putting all his time on productive work is doing them. If they are not being done right, the whole shop is working at reduced efficiency, work is spoiled, and maintenance costs are higher than they should be and pull-ins are too numerous."

"That's the spirit, Dick. You're going at it the right way. But I think you're working on something almost entirely new in this old electric railway game and it'll be a hard grind to make our shop really understand what you're driving at. We can't settle it tonight, anyway, so let's turn in so as to be all fresh in the morning when we visit the Centerville people."

"I guess that's a good idea," said Dick as they moved out the door. "I'll shoot these questions at them tomorrow and find out what they've got to say."



A Carriage with Adjustable Wedges that Centers the Armature with the Pinion Puller

mature is placed on a carriage, so that it can be pushed into position readily and is always centered with the pulling apparatus. The carriage, which consists of a wooden framework with four small cast-iron wheels, moves back and forth on a short track made of two pieces of 6-in. channel. The armature support on the carriage has wedges with four different bevels, adjusting the height to support four different armature diameters. The faces of the wedges are marked so that they can be readily placed in position for the particular type of armature from which the pinion is to be removed, so that it will come central with the shaft of the pinion puller when shoved into position.

To remove a pinion the carriage is pushed forward so as to come in contact with the central shaft of the pinion puller which rests against the end of the armature shaft. Two jaws which go in between the end of the pinion and the head of the armature slide in guides and are moved by a screw with a handwheel on the side of the guide. Another screw on the end of the pinion puller forces the central shaft firmly against the armature shaft. The pinion then can be removed by pulling the vertical handle which actuates an eccentric cam to give the necessary force for removing it. The pinion puller was made by the Metropolitan Engineering Company, Brooklyn, N. Y., but the mounting and adjustable features were made in the shops of the railway.

Old Car Made Into Traveling Paint Shop

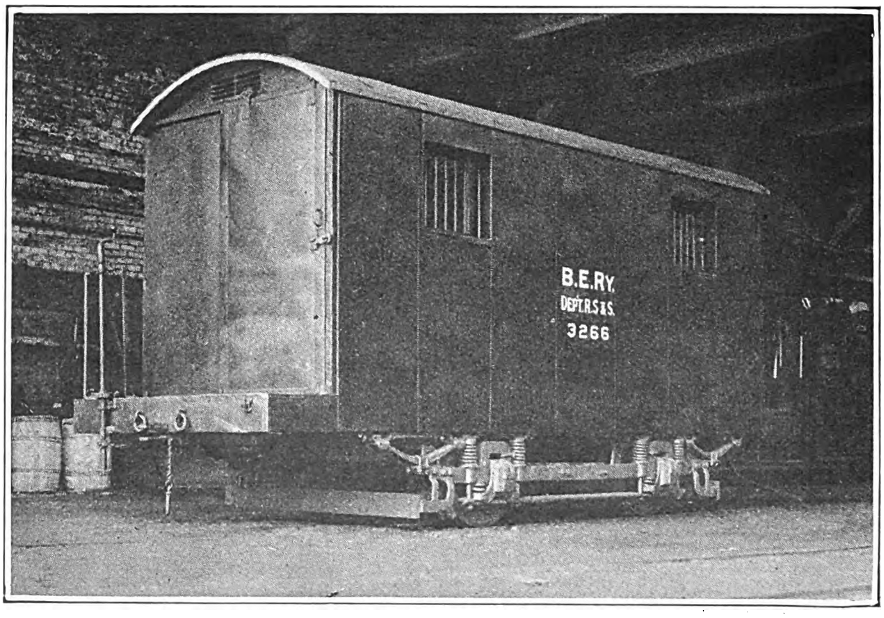
SINCE the building of the new Everett shops of the Boston Elevated Railway, car painting has been done there whenever possible. The cars operated in the Cambridge subway, however, are too wide to be operated over the tracks reaching the new shops. For that reason a traveling paint shop has been arranged by building a new body on the frame of an old single-truck car. This vehicle carries a complete outfit of painters' supplies and also provides a place where the men can change their clothes. The car is not motorized, but is pulled from place to place by a service car. Since its completion the traveling paint shop has proved to be a convenience for the purpose intended, as well as for other odd painting jobs.

Reclaiming Worn Compressor Cylinders

WHEN air compressor cylinders become badly worn or scored the efficiency falls off very rapidly. Several different methods are used for reclaiming the cylinders, the most common being to follow the automotive practice of grinding the cylinder to an oversized dimension and using oversized pistons.

The Twin City Rapid Transit Company's mechanical department does not use this method because of the necessity of carrying special pistons in stock, and also because the capacity of the compressor is changed by the oversized bore. Instead, the practice on this property is to bore out the worn cylinder to a predetermined dimension and then to insert cast-iron sleeves which are pressed into the cylinder. These sleeves are then bored and ground to a final finish which retains the original standard size for the bore.

When the cylinders are bored out, they are made large enough to leave the finished sleeve with approximately a $\frac{1}{8}$-in. wall. Before they are pressed in and rebored, these sleeves have an interior bore small enough to give a wall thickness of sufficient strength to withstand the strain of pressing into place in the cylinder. This thickness is approximately $\frac{1}{2}$ in.



This Car Carries a Complete Outfit of Painters' Supplies and Provides a Place Where the Men Can Change Their Clothes

The cylinders themselves are bored 0.002 to 0.003 in. under the outside diameter of the sleeves, to allow for a press fit.

When the cylinder is bored out, a shoulder is left near the bottom of the cylinder wall, and this forms a stop for the sleeve when the latter is being pressed in. If the cylinders become worn or scored a second time, it is a simple operation to bore out again and install new sleeves.

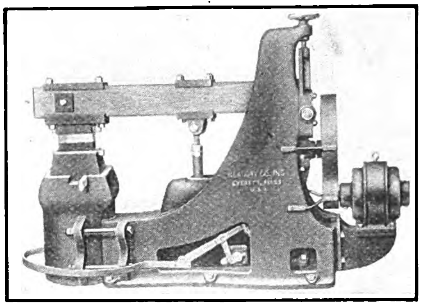
New Equipment Available

Air-Cushioned Helve Hammer

An air-cushioned helve hammer with many new features in design is being introduced to the market by Baudry Company, Inc., Everett, Mass. The hammer has a semi-inclosed frame, upon the rear of which is an adjustable yoke supporting the helve at its pivoted end. The air compressor within the frame is cast in one piece with a cylinder actuating the helve, the piston of which connects with the helve. A rotary valve operated by the treadle is located between the two cylinders for controlling the blow.

The machine is designed for either belt or motor drive. When belt driven, tight and loose pulleys and belt shifters are included as a part of the unit. For motor drive, the tight pulley is replaced by a gear engaging the pinion of the motor, making the machine entirely self-contained.

The hammer has no rubber bumpers, being cushioned entirely by air. The machine will also deliver its lightest tap or its heaviest blow at full speed. This results in increased production. Regulation by the pedal does not change the speed of the hammer but only the strength of the blow. When at rest the hammer is at the top of its stroke with the helve elevated and dies apart ready to receive the work. The hammer compresses its own air so that no outside supply is necessary. The two cylinders are cast integral with the semi-inclosed frame. One compresses air and the other distributes it for the use of actuating the hammer helve. The air supply to the cylinder is regulated by a rotary valve operated by a treadle. The hammer helve is adjustable for varying thicknesses of stock. The anvil is entirely separate from the main frame casting.



Helve Hammer with Air Cushioning

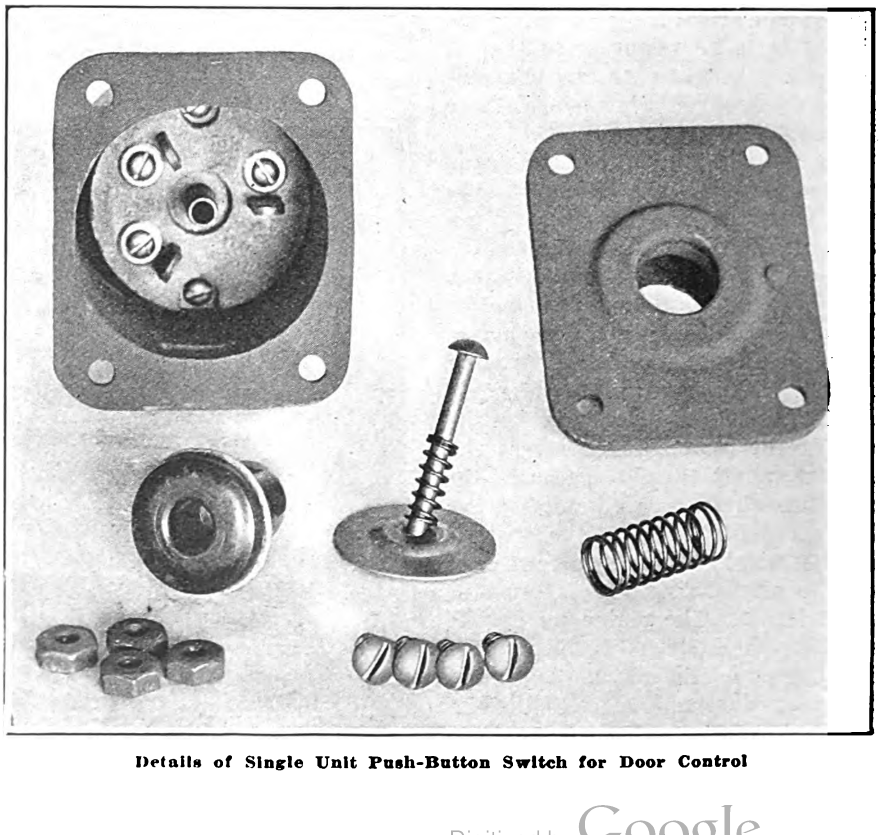
The pivot of the helve has hardened steel centers easily adjustable and affording a means for entirely eliminating side play of the dies so that they will always register with each other. When adjusting the dies for different thicknesses of work, four nuts are loosened on the pivot yoke and the hand wheel on top of the machine is turned the proper amount to raise or lower the yoke, after which the four nuts are tightened. The connecting rod of the helve is adjusted by a turnbuckle. This makes the adjusting a one-man job. The machines are built in four sizes with from 40 to 200 lb. rams. The floor space occupied is small, being 26 in. x 60 in. for the 40-lb. size and 36 in. x 75 in. for the 200-lb. size.

Push-Button Switches for Door Control

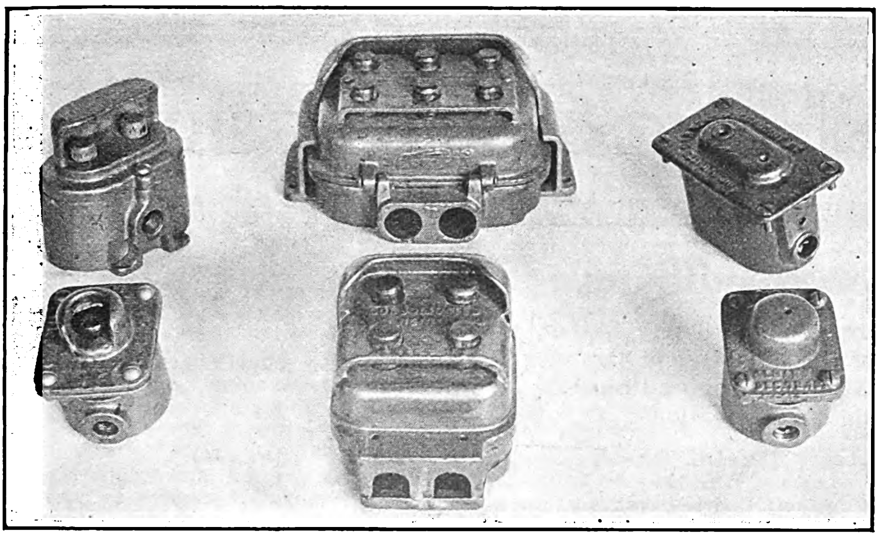
Several improvements have been made in the construction of the 307-type of push-button switches furnished by the Consolidated Car Heating Company, Albany, N. Y., for electric control of door engines. An accompanying illustration shows some of these switches, which are made in single, double, four or six-button units. All have cast-iron cases.

The contact disk is made in two types. For low-voltage use (battery circuits) a metallized carbon disk is employed, and a monel metal disk is used for 600-volt circuits. When the metallized carbon disk is used, a reinforcing plate is added to prevent breaking.

In the illustration which shows the details of a single-unit 600-volt switch, it will be noticed that the monel metal disk has a boss at the center. This provides for a rocking action of the disk, so that it will make firm contact without being influenced by the pressure of the push button or stem. Two helical springs are used with this construction, one between the insulated base and the disk to open contact as soon as pressure is released, the other between the push button and the disk to permit a further movement of the push button after the disk is firmly in contact. The springs are of phosphor bronze to eliminate corrosion.

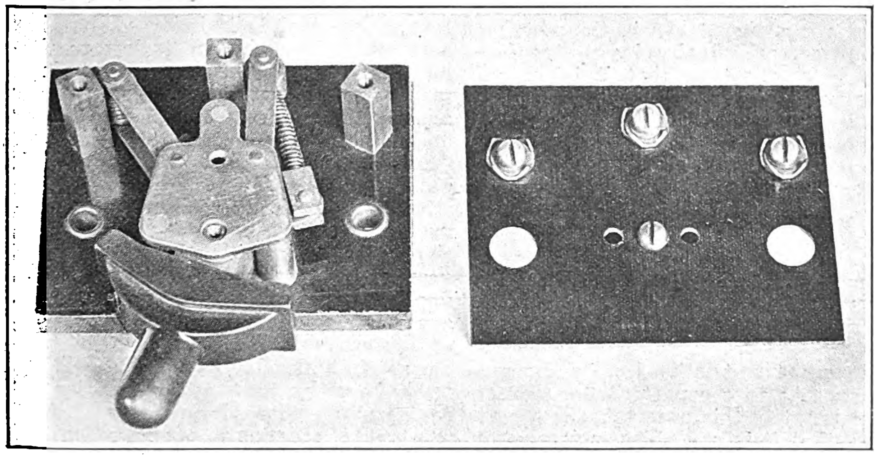


Details of Single Unit Push-Button Switch for Door Control



Six Types of Push-Button Switches Used for Electric Control of Car Doors

The cases are arranged for conduit connection and are ventilated to prevent an accumulation of moisture. The stationary contacts are mounted on a molded base. The plunger has a long guide to eliminate binding and is provided with a button head to fit into a recess in the push button. This button head allows the button to rock, so that a side thrust will not interfere with the working of the plunger. A rawhide washer between the back flange of the button and the case takes up any shock in case the button is released suddenly, and eliminates breakage. The standard construction for the stationary contacts is with three posts. This insures better contact. The cases are provided with shields to protect the buttons where there is likelihood of passengers leaning against them. In the illustration showing six types of switches, the two at the right without push buttons are arranged for outside operation of doors. A small opening in the cover provides for the insertion of a nail or small wire to operate the button. Improvements have also been made in the electric switch which is furnished for door control, where push buttons are not desired. The operating mechanism of this switch is of toggle form so that the switch is thrown with a snap as soon as the operating handle passes the center. The switch has a bakelite handle and the bearings of the toggle mechanism are of hardened steel. An accompanying illustration shows the construction.



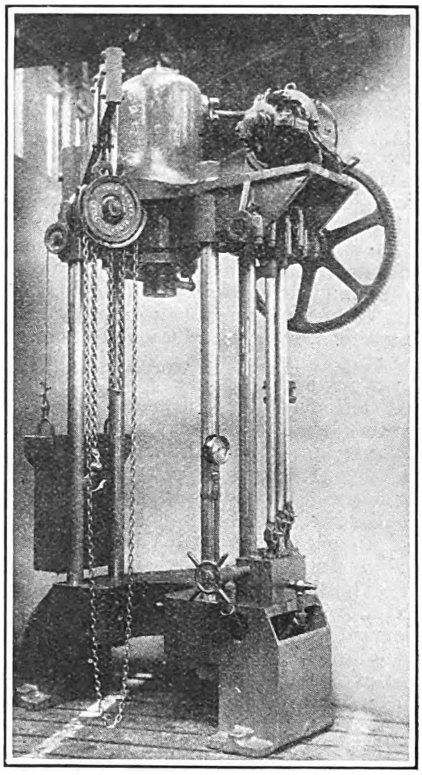
Toggle Switch Used for Electric Control of Door Engines

Twist Drill Grinder

AN ELECTRICALLY driven 6-in. bench or pedestal grinder which will quickly and accurately grind straight or taper-shank twist drills up to $\frac{5}{8}$ in. in diameter has been placed on the market by the Black & Decker Manufacturing Company, Towson, Md. The twist drill is fed to the cup-grinding wheel by means of a micrometer screw feed. No adjustments are necessary for grinding different sizes of twist drills, this being compensated for in the new design.

Rapid Action Hydraulic Press

A SELF-CONTAINED rapid action hydraulic bushing press has recently been placed on the market by the Southwark Foundry & Machine Company, Philadelphia, Pa. The press is entirely self-contained and is complete with a hydraulic pump and electric motor so that no auxiliary water or air connections are necessary. The rapid movement of the ram is obtained by a triplex pump with one low and two high pressure plungers. The high-pressure plungers are of small diameter. The third plunger is of larger diameter and pumps a large volume of water, bringing the ram rapidly down to the work. As soon as contact is made the pressure builds up in the cylinder and the low pressure plunger then automatically cuts out and the working pressure is supplied by the high-pressure plungers. A counterbalance returns the ram to the starting position.



This Hydraulic Press Has a High and Low-Pressure Triplex Pump to Do Fast Work

The bottom platen or work table has the slack water tank as an integral part of it. This platen can be furnished in several designs to suit work. The press can be furnished in capacities of from 30 to 200 tons. An overhead jib crane is supplied to take a chain block hoist so as to handle work on both sides of the press.

Association News & Discussions

Hoover Conference on Road Safety

Representatives of All Concerned in Street Traffic Safety Gather and Give Solution of the Accident Problem a Big Impetus by Drawing Set of Principles for Guidance of All in Developing Proper, Adequate and Uniform Laws and Regulations

UNDER the auspices of the federal government, a most remarkable nationwide conference directed toward reduction of the serious number of accidents on our streets and highways was held in Washington, Dec. 15 and 16. The National Conference on Street and Highway Safety was called by Herbert Hoover, Secretary of Commerce, who personally acted as chairman during a large part of the deliberations. The attendance of some 500 came from practically every state in the Union and included representatives of every industry and activity having any concern with the use of the streets and highways. There were police officials, public service commissioners, highway and motor vehicle commissioners and representatives of insurance companies, railroad and street railway companies, safety councils, chambers of commerce, labor unions, women's clubs, automobile associations, automobile manufacturers, and various other national groups. National associations which co-operated with the Department of Commerce in organizing and financing the conference were the American Electric Railway Association, American Railway Association, American Automobile Association, American Mutual Alliance, National Automobile Chamber of Commerce, National Safety Council, National Bureau of Casualty and Surety Underwriters, the National Taxicab Association and the Chamber of Commerce of the United States.

The morning session on Monday was given over to a presentation by summary of the eight committee reports which had been prepared at the direction of Secretary Hoover during the past six months. These covered statistics, traffic control, construction and engineering, city planning and zoning, insurance, education, the motor vehicle and public relations. The personnel of each of these committees was made up of men selected by the secretary in co-operation with the various associations and organizations in order to get the most competent as well as most representative groups together on each committee. E. J. Murphy, chief statistician American Electric Railway Association, was a member of the committee on statistics. J. P. Barnes, president Louisville Railway, was a member of the committee on traffic control and the committee on public relations. C. E. Morgan, vice-president Brooklyn City Railroad, was a member of the committee on construction and engineering. L. S. Storrs, president the Connecticut Company; Daniel L. Turner, consulting engineer New York State Transit Commission, and Charles B. Scott, Bureau of Safety, Chicago, were among the members of the committee on city planning and zoning. Mr. Scott was also a member of the committee on insurance. Edward Dana, general manager Boston Elevated Railway, and W. D. B. Ainey, chairman Public Service Commission of Pennsylvania, were members of the committee on education. L. H. Palmer, vice-president and general manager United Railways & Electric Company of Baltimore, was a member of the committee on the motor vehicle. Thus the electric railway industry was represented on each of the committees.

At the afternoon session on the first day the eight committee reports were opened to discussion. At five o'clock Chairman Hoover announced that the time had come for the various groups to assemble, according to an announced plan, and each to select a delegate to represent it on the "steering committee" which would meet that evening to draw up a report that would form a consolidation of the eight individual committee reports and place a definite program of recommendation before the conference on the following morning for its action. The electric railway group selected L. H. Palmer as its representative and Mr. Barnes also served on the steering committee by virtue of being official delegate of the American Electric Railway Association.

On Tuesday the conference went over the consolidated report, point by point, and passed upon it. The debate on many points was lively and earnest. Each point in the final report represents the harmonizing of views, first in the committees, then in the steering committee, and finally by the conference as a whole, so that it is an expression which probably comes as nearly as can be obtained to meeting the approval of all interests. A review of the final report as adopted by the conference follows:

Recommendations Requiring Legislation

Under the general heading of Legislative Principles, the report indicates the desirability of avoiding too much detail in legislation, and also advises a minimum of restrictive laws and regulations. As to the part of the federal government in this program, the report states that it is one of encouragement, of assembly and distribution of information, and the development and use of best practices, but expresses the belief that uniformity of traffic laws will be secured by voluntary action of the various states.

Each state should enact constructive legislation, including enabling acts, which will empower cities and other local units to provide for a proper development of the traffic situation in their territories. A state department or bureau should be created to administer the laws applying to motor vehicles, including the issue and revocation of licenses for both cars and drivers and the enforcement of regulation on the highway. The motor vehicle department should have a staff adequate and qualified not only to handle licenses but to examine drivers, regulate traffic on the highways, investigate accidents and enforce regulations regarding design, construction, inspection and maintenance of motor vehicles. Regulatory legislation should be for adoption by states and not by cities.

Under municipal government there should be an adequately manned traffic division in the police department, with traffic safety a major function. In all states and municipalities there should be specific provision for adequate and timely planning of traffic facilities and traffic control measures. These should be closely co-ordinated nationally, between adjoining states, and between states and their political subdivisions. Large metropolitan areas should establish special traffic planning commissions to study the flow of traffic and to eliminate hindrances to this flow and correct unsafe traffic conditions.

Full Stop Urged at Dangerous Railroad Crossings

To eliminate grade crossing accidents, the conference recommended that legislation be passed requiring all motor vehicles to come to a full stop before crossing such railroads as are designed and marked accordingly by the state railroad or public utility commission. In other words, the stop law as a principle is indorsed, but its application in each case is left to the judgment of the state commission, rather than to suggest a blanket law applying to all grade crossings. Elimination of grade crossings, either by relocation of highways or rail lines or by grade separation, the report states, constitutes the only perfect solution of the grade crossing problem. But this should be carried on under proper programs, so as not to impose an excessive financial burden, resting in the last analysis upon the public. Relocation of highways offers many possibilities not yet fully developed, which should be worked out by the state authorities in co-operation with the railways. Authority to order grade separation or proper protection at grade crossings should be vested in the state commis-

Coolidge Stresses Urgency of Conference Task

PRESIDENT COOLIDGE asked the privilege of addressing the Hoover Conference and at 2 p.m. on Tuesday made the following statement to some 500 delegates assembled before the South Portico of the White House:

The national conference on street and highway safety has been called by the Secretary of Commerce for the devising of means and the making of recommendations toward the lessening of the numberless accidents which now kill and maim so many of our citizens. Few conferences are more opportune or deal with graver affairs. With the deplorable and continuing increase in highway mortality and injury the time is highly appropriate for a comprehensive study of the causes, that we may have proper understanding of conditions and so may intelligently provide remedies.

The problem is but one of those inherent in advancing civilization. The increasing demands upon our highways from a growing population, the development of new uses, the imposition of modes of transportation not contemplated when they were created, have brought about congestion, confusion and conflict, until the yearly toll of traffic accidents has reached an appalling total. If the death and disaster that now fall upon innocent people, through the year and over our country as a whole, were concentrated into one calamity we would shudder at the tremendous catastrophe. The loss is no less disastrous because diffused in time and space. The evil you are combating is so widespread as to be of national concern, and we do well to look at it with a country-wide vision. But its solution does not rest in national action. Highway control is primarily for the states, and it is best that this is so.

We cannot regulate local traffic by act of Congress. Means to overcome the difficulties, to keep our complex traffic moving with order and safety, must be found by the states. It is a proper function of federal authority to mobilize the best experience in each part of the country that it may be applied elsewhere, to the end that rules may be wise and uniform. But uniformity, while of the greatest value and highly advisable, so far as shifting local requirements will permit, should not be imposed by the inflexible fiat of central power. Rather, it should come from the common desire of the states to give the highest protection to their people, to regulate traffic in the most efficient manner, with final realization in the attainment of a common standard of perfection.

This is the high ideal toward which you are striving and your task is the finding and suggesting of methods of accomplishment. You have already done much by impressing upon the minds of our people knowledge of the terrible toll of traffic accidents. The further course of action and regulation will largely depend upon your recommendations. The undertaking is of supreme value, and you have my best wishes in your efforts.

sion having jurisdiction over the railways, which should also determine and enforce a proper division of the cost between the railroad and the public. These matters are of such importance and involve to such an extent the public safety as to require that priority be given to them in the allocation of capital funds by the railroad, over expenditures for other safety measures designed to protect the public.

Special traffic courts for handling violation of traffic laws should be established, both rural and city. No unlicensed person should be permitted to operate a motor vehicle, and before an operator's license is granted, the applicant's ability to operate a motor vehicle safely should be determined by ascertaining his physical and mental fitness, his knowledge of the laws and by actual demonstration. Such a license should not be granted to any person under 16 or unable to read.

Reckless driving and any other flagrant disregard of the rights of others by any user of the street or highway should be vigorously and unceasingly prosecuted. Adequate penalties should be provided, including the mandatory revocation of licenses for a specified length of time for cumulative evidence of carelessness or irresponsibility, or for operating a motor vehicle while under the influence of liquor or drugs, and severe penalties should be provided for driving during the period of suspension or revocation.

Regulation of speed of vehicles should be directed primarily at reckless driving and should be uniform throughout the country, as far as practicable. It should be unlawful to operate a vehicle at speeds greater than are reasonable and proper, having regard for the traffic and the use of the highway, or so as to endanger the life, limb or property of any person. The state law should prohibit any municipality from establishing a speed limit lower than 15 m.p.h. In rural areas, instead of an absolute speed limit, it should be provided that when any vehicle exceeds 35 m.p.h. that speed shall be *prima facie* unreasonable.

All states should adopt the principle of certification and registration of automobile titles as an effective means of reducing thefts and the accident hazards which go with them. Statutes should be passed in every state making it the specific business of some state agency to receive traffic accident reports and to investigate accidents, whether occurring in or beyond the corporate limits of municipalities. It should be made obligatory by law for those concerned to report traffic accidents involving serious personal injury or property damage.

Safety education should be incorporated in the curricula of all schools.

Administrative and Regulatory Principles

Under this general head, the report recommends uniformity with respect to all traffic regulations, and emphasizes the importance of careful statistics on street and highway accidents, urging their collection, publication and analysis in every state and community. A form of accident report is suggested, as is also the maintenance of spot maps as a means of detecting those points at which accidents occur most frequently.

Special regulation for the use of particular streets, such as the placing of automatic signs and signals, designation of arterial streets, restriction as to class of traffic, direction of traffic, parking privileges, etc., should be based upon competent traffic counts and analyses and established in accordance with some general plan of traffic movement founded upon the design of the street system in each city.

In congested centers where large volume of vehicular movement takes place between points considerably removed, the report suggests that an effort be made to segregate street cars, motor trucks and passenger automobiles on separate thoroughfares.

Under the heading of City Planning and Zoning, the report speaks of the fact that street hazards can be greatly reduced by a proper arrangement of streets and that each community should study its own special problems, with particular emphasis upon elimination of grade crossings with railway lines, classification of traffic with suitable facilities for each, location of traffic-originating centers so as to distribute them, and creation of by-pass highways and belt highways. Other subdivisions under the heading of city planning and zoning treat of day storage space for automobiles, design and equipment of streets, importance of sub-centers and satellites, relation between street facilities and development of private property, playgrounds and schools, inter-relation of traffic facilities, comprehensive traffic and thoroughfare plans.

Construction and Sign and Signal Standards

Under the heading of Street and Highway Construction, the report deals with roadway width and suggests that every pavement in a city street should be wide enough for at least three lanes of traffic without street cars or four lanes of traffic with street cars. These widths should be multiples of 9 ft. for motor vehicle lanes and 10 ft. for street cars. Right-of-way for parking space and for clear view at curves and intersections, provision for parking space, grades not to exceed 6 per cent, curves of not less than 300-ft. radius on highways of primary importance, cross-section of the pavement and guard railing are other topics treated. A clear view of approaching vehicles for at least 300 ft. should be provided at all points on highways of this character. Every bridge on an improved highway should be least 22 ft. wide.

For signs and signals, both luminous and non-luminous, the conference adopted the following recommendations for color indication: Red for "Stop," green for "Proceed," yellow for "Caution" as at curves; some special cautionary indication at crossroads; white letters or symbols to be used on the red or green background and black on yellow. Distance and direction signs should be black and white.

Railroad crossings remaining at grade should be safeguarded in every reasonable way. Standard warning signs and pavement markings should be used to indicate the approach to all public railroad crossings. Where the volume of traffic requires it, additional protection should be afforded by the use of flagmen, gates or approved electric or mechanical devices. So far as possible, a clear view along the track in both directions from both sides should be maintained. Sharp curves, abrupt changes of grades, roughness in the pavement or other conditions at or near the track which tend to divert the attention of the motorist should be avoided. Spotting of cars near the highway so as to obstruct the view should be prohibited. Marking and lighting of highways was also treated under this section.

REQUIREMENTS OF THE MOTOR VEHICLE

Pending adoption by constituted authority of a code for standard braking ability, all motor vehicles should be capable of stopping by means of the service brake alone in a distance of not more than 50 ft. from a speed of 20 m.p.h. on a dry, smooth, hard-surfaced road free from any loose material. The emergency brake should be capable of the same performance. Lost motion or play in the steering gear should be limited to about 15 deg. The toe-in of front wheels should never exceed $\frac{5}{8}$ in. Clear red should be used for tail-lights and the rear aspect of parking lights, and it should be prohibited for any other exterior lights on the car. Clear yellow should be used for stop lights. The location of spot lights should be limited to the right of the vertical center line of the vehicle and the beam of the spot light should never be directed to the left of the vertical center line. Design of bodies and cabs should be carried out with due regard to the necessity of reducing to a minimum the shut-off area of driver vision. The use of posters or any other obstruction to vision on the front windows or on the windshield should be avoided.

The over-all width of vehicle and load of any motor vehicle should be limited to 96 in. Loading beyond the rated capacity of any vehicle should be prohibited. Adequate and periodic inspection and proper adjustment and repair of motor vehicles are absolutely essential. To this end there should be prepared a simple and practical inspection chart applicable to all makes of motor vehicles, giving particular attention to items affecting safety, for distribution by the Department of Commerce. Public service commissions and other public bodies having control of common carriers operating motor vehicles should establish reports and methods of supervision to insure adequate inspection and upkeep.

Under the heading of Conduct of Drivers and Pedestrians, rules of the road, passing, parking and stopping, hand signals and courtesy are all treated. A single cautionary signal, made by extending the arm well outside the vehicle, is recommended as the one and only signal to be used by the operator of an automobile or motor vehicle about to turn, slow down, stop or back. This is recommended as preferable to a code which attempts to show more exactly what the operator intends to do. A speed exceeding 15 m.p.h. on approaching within 100 ft. of any railroad crossing should not be permitted at crossings where the full stop is not required by law. The use of badly worn tires, especially on the front wheels, should be avoided as a positive source of danger.

The report recommends that education in safety and accident prevention should be incorporated in the curriculum of elementary schools by various means which are enumerated. It deals at some length with suggestions for co-operative work among various associations, unofficial organizations, manufacturers, insurance companies, automobile clubs and public agencies, operators of fleets of motor vehicles, and the schools and colleges. Suggestions are also made for safety education of the public.

Secretary Hoover made it plain that it is not his desire to set up a new permanent national organization devoted to safety.

The work of this initial conference will be followed up as effectively as possible, and it is probable that it will be called into session again one year from now, to determine how much has been accomplished, and to continue the general effort. Meantime, special phases of the problem will be given study by a few special voluntary committees of technical experts.

A New Conception of the Job*

Maintaining Street Railway Personnel Depends on Explaining Company's Purposes to Employees and Relation of Individual to Railway—Attitude of Employees Should Be Made Constructive and Conservative

BY S. F. FANNON
Director Department of Public Service, Sherman Service, Inc., Boston, Mass.

IN A MILL, plant or factory, the entire proposition is practically under one roof or at least under several roofs in close physical relation. All the factors are conveniently located and grouped so the management can keep its finger on the pulse from the moment raw material enters until the finished product goes out the other end of the plant. And yet such are the inherent difficulties that even under these favorable physical conditions the 100 per cent successful industrial plants are relatively very few.

In the street railway business you at once find the executive is confronted day and night by an infinitely more difficult situation, on which the following reasons will throw some light:

CONDITIONS DIFFERENT ON RAILWAY

1. His plant (machinery and equipment) is split up into as many unit plants as he has cars in operation.
2. His working force is also split up into as many unit forces as he has car crews in service.
3. Both his unit plants and unit forces are out of sight most of the time. This makes it practically impossible for him to keep his eye on plant or personnel as he could in any other industry.
4. It follows, therefore, that his men work largely without supervision of the kind that every industrial manager would consider essential.
5. Not only must his unit plants, which cost large sums and are subject to heavy depreciation if poorly handled, be intrusted to the care of the unsupervised employees who are charged with the duty of operating the cars, but he must depend on those unsupervised employees to perform a series of important duties, namely: His employee must (1) *manufacture* his product (which is transportation and service to the public); (2) *display* his product to his patrons; (3) *sell* his product to his patrons; (4) *deliver* his product to his patrons; and (5) even *collect* his money from his patrons and turn the receipts in at the cashier's office.

There seems to be no parallel in any other industry where such a demand is made on the loyalty and interest of the employee. Suppose a worker in a factory which manufactured autos, shoes, or any article or commodity were charged with duties similar to those of a street railway platform man. That factory worker would have to work without supervision to manufacture his product, then he would change his clothes and go out to display and sell his product. He would come back, change his clothes again, pack up and deliver his product. Then he would have to go back again to the customer and collect the bill for the product, so manufactured, so displayed, so sold and so delivered.

The executives of a street railway have a larger problem in employment than most executives. The platform man has to perform his duties under unusual conditions. He is obliged to stand on his feet a good percentage of the time; he must work night or day as the schedule demands, and may miss regular meals and have no regular hours with his family. He must be exposed more or less to the elements in all kinds of weather; he must work every day, week days, Sundays and holidays—he must work in contact with the public which represents the patrons of his employer, he must virtually represent his employer—the company—in fact he *is the company* to the average car rider. These are a few of the conditions that face the street railway executive of today.

You have been hearing a great deal in your various meetings and through your various journals about the maintenance and upkeep of your properties, shops, machines and rolling stock. You have heard of and know the importance of each in the railway business. They stand out in great prominence, but it is indisputable that in all lines of industry today the human factor is the controlling factor, and in the street railway business and on your property the human factor is by far the most important factor with which you have to deal. No matter how modern your equipment or how automatic your machine the successful operation of these devices rests entirely in the hands of the employee, actuated by various motives, because a motive, or an interest of some kind, is behind every act of every man.

---

*Abstract of a paper before the New England Street Railway Club, Boston, Mass., Dec. 4, 1924.

A man's motives, more than anything else, determine his usefulness as an employee. Now let us make a scientific analysis of the employees in business today. We find in every business three kinds of motives, and consequently three kinds of employees. I don't mean three kinds of employees by race, sex, creed, language, craft or trade. In this, it makes no difference whether employees are skilled or unskilled labor, or where they work, or what they make.

We find the conservative employee, whose motives are constructive. We find the negative employee, whose motives are negative and reactionary. We find the neutral employee, whose motives are neither definitely for bad nor good.

TEN PER CENT CONSERVATIVE, TEN PER CENT DISCONTENTED, REST NEUTRAL

The proportions into which we find a working force to be divided into these three kinds of employees will vary, naturally, but taking a thoroughly typical case, we find that 10 per cent are conservative, thoroughly contented with their employer and employment; another 10 per cent are negative, thoroughly discontented with their employer and employment; the remaining 80 per cent are neutrals, not contented as the conservatives are, not discontented as the radicals are, but indifferent.

We find that the conservative employee gives his employer a full day's work up to the limit of his skill. This means practically a 100 per cent return for the employer. We find that the negative employee gives his employer only 50 per cent or less of a full day's work. And we find that the neutral employee gives his employer 75 per cent of a full day's work. Now, you have always known that these three kinds of employees existed upon your property. You have always known the good employee who gives you a real full day's work and gives it willingly. You have seen his sunshiny face upon the platform of your cars. You have heard his pleasant "good morning." You have noted his assistance of the elderly on and off the car. You have heard his polite reply to numerous questions of the passengers. You have noted his close following of schedule, his interest in the upkeep of the car. He has time and again brought to you suggestions. This is the conservative, the man who is giving to you 100 per cent effort in return for the wages he draws. You have many times noted the man whose face carried the frown, whose very bearing spoke antagonism. He has no interest in carrying out the schedules. It is of no importance to him as to the appearance of his car or to the service he is rendering either the public or the company. This is the negative man—the man who is giving to you but 50 per cent of his ability. And again you have seen that great company of employees whose whole demeanor is that of unconcern. They seem to be saying, "Oh, what's the use, so many hours to put in, so many miles to travel. How soon will we be through?" They keep their eyes on the clock and go listlessly through the motions day after day with but a half interest in their work.

In the maintenance of the personnel in industry we have been very watchful as to the health of the employee. We are selecting with greater care each day the man whose mentality is strong. We are quite alert as to his morals. All these are important and are bound to aid in developing our employee's interest and satisfaction in his work. But do you not realize that the all-controlling power, the real force, is the employee's motives?

Does not the above analysis point out to you that we have another far more important step to take, the development of the motives of the neutral and negative employee to those of the conservative, the developing from this misunderstanding to understanding, from lack of interest in the job to real interest?

It is men we are dealing with, men made in the image of God, men upon whose shoulders rests the responsibility for the development of our civilization and nation. Dare we give to them less attention than we give to a machine? The machine is not working correctly. Do we leave the machine to run on giving under-production? Do we throw it to the scrap heap? No. We call upon the man who understands that machine. He analyzes and locates the trouble. But we do not stop there. We have him put that machine into such condition that it works properly, that it may give to us the desired capacity.

The employee must have brought to him in a tactful way, in a language that he understands, in a way that has a pull for him, the real facts about economics. He does not understand that 80 to 85 per cent of his entire output he buys back, and not only buys back but sets the price of the buying. He does not understand that it is not the number of dollars in his pay envelope that counts, but what the dollars will purchase. He must be told about his position, its opportunities and responsibilities. He must be led to understand the value of the town he is living in, why it is a good place for him and his family, to the meaning of liberty, the value of laws and the courts, the responsibility of citizenship.

Here is the problem that faces us today. It requires the most intimate knowledge of humanity. It is a challenge of the most scientific sort. But I am glad to be able to say that it is being accomplished. Skillfully, scientifically, through great study and deep research, scientists are leading the employees of various industrial organizations to a clear conception of their responsibility and obligation to a motive that puts interest into the job that is theirs to perform.

Eliminating Street Car Noises*

Numerous Sources of Noise on the Car Are Pointed Out and Remedial Measures Suggested for Each—A Higher Standard of Maintenance the Main Remedy

By R. W. BAILEY

Superintendent Power and Equipment Kansas City Railways

SINCE the advent of the rubber-tired vehicle into the transportation field the noise emanating from metal wheel on metal rail, with the many contacts of metal to metal in trucks, brake rigging, etc., has become a source of annoyance. Noise is more or less a relative thing. Whether or not a thing is considered noisy is generally determined by comparison with other sounds. A car that would be considered extremely noisy today, ten years ago would have been considered a quiet running vehicle. With the clatter of the hoofs of horses, rolling of steel-tired wagon wheels over the street, etc., the noise from a street car was given very little consideration. Times have changed and something must be done to reduce the noise made by street cars.

The first question that confronts the mechanical department of the street railway today is the elimination of noise in the cars we are now operating. It must be remembered that many of these cars have been in service for from 5 to 20 years. In the design of this equipment very little attention, if any, was paid by the manufacturers to the elimination of noise. Metal to metal contacts, without any particular attention to close fits, make a condition that is hard to control. For instance, the present brake rigging on our cars consists of numerous floating parts joined together by pins and bolts. Our trucks, journal boxes and lids, springs and spring clips, air compressors, drawbars and attachments, motors and motor suspensions, gears and gear cases, door engines and step mechanisms, all body noises, and trolley bases and trolley wheel noises, all contribute more or less to the general noise made by the car. Last, but not by any means least, is the condition of the track over which the equipment is to operate. However, assuming that the track is in fair operating condition, with not more than the usual number of loose joints, corrugated rails, cup joints, etc., there are many parts of the equipment that can profitably be given increased attention. Just how far we can go in making cars quieter depends to a certain extent on the amount of money that is to be spent.

Wheel noises are largely due to vibration in the metal of the wheel itself. At a meeting of our mechanical men held recently two means of muffling this ringing were discussed. One method consisted of drilling additional holes in the web of the wheel and the other contemplated bolting oak blocks or pieces of lead plate to the web to deaden this ringing noise. We are attempting, with cast iron wheels, to produce the same results by putting a lead plate between large washers and bolting onto the wheel. While this deadens the sound, it has not as yet been demonstrated that it is practicable. We are still following it up with great interest. Flat wheels are another source of disagreeable noise and if properly inspected and ground these can be practically eliminated. However, under certain conditions they are so frequent that the expense of properly removing the flats promptly is prohibitive and the wheels are allowed to continue in service.

---

*Abstract of paper presented before meeting of Midwest Electric Railway Association, Nov. 24, 25, 1924, at St. Louis, Mo.

A cushioned wheel is being manufactured and is now in service on steam railway inspection cars. Application of this construction to street cars would undoubtedly materially reduce the vibrations that are set up in the wheel and transmitted to the equipment. Just how far this would go to eliminate noise must be demonstrated, but it is worthy of serious consideration.

JOURNAL BOXES AND BRAKES

Journal box noises originate from wheel impacts transmitted through the journals to journal box covers and such parts of the truck as make metal to metal contact. The wear plates on pedestals should be kept tight. Some types of journal boxes are also provided with plates that should be given the same attention. We have decided to do away with all spring lids on our present journal boxes and have devised a method whereby all lids are now bolted tight in place. We have also tried a few wooden lids to see what success we might have.

Brake noises are due in many instances to the fact that not enough attention is paid to the fit of the brake head and shoe. If a shoe is properly fitted to the brake head and properly keyed there should be very little noise at this point. Closer inspection as to the replacement of brake heads undoubtedly would eliminate considerable noise. Swinging brake beams, brake levers, equalizers and brake rods are another source of noise, and it seems that about the only proper thing to do is to maintain closer fits, taking care of pin wear and bushing renewals and making fits on clevices as close as possible, without binding the brakes. This is a matter that I think we have all overlooked more or less. Also, attention should be directed to seeing that brake rods are properly supported so that they will not be striking other equipment or the car body.

TRUCKS CONTRIBUTE ALSO

Trucks that have not been well maintained and on which worn parts have not been replaced, generate noises at many points. The disagreeable noise made by motor gears is due primarily to the fact that we do not maintain close centers between gear and pinion. We have all been trying to get the longest life possible out of all types of bearings for purposes of economy, and noisy operation has been the result. Worn axle brasses, by permitting gears to mesh poorly, are thus one of the chief causes of noise. It may be because axle brass renewal already is one of the largest items of equipment maintenance cost that we tend to overlook the noise from this source. If axle brasses are removed before the gears become noisy the present limits of wear allowed will have to be decreased materially.

This question also involves serious consideration of gear cases. When properly installed they cause little noise, but when the gear is out of alignment or off center, the case acts as a sounding board to magnify these noises. Excessive lateral wear in armature and axle bearings will allow the gear or pinion to strike the case and it then becomes very noisy indeed. Proper lubrication of gears, in fact of all moving parts, is another important factor to be considered in connection with this subject.

Body noises originate from many causes and include a wide variety of squeaks and rattles resulting from service strains and from loose parts. The body and vestibule sash, body doors, register mechanism and many other fittings are the chief sources. Special attention should be given to keeping sash tight, as they are one source of particular annoyance. Also, many rattles can be removed by taking care of the fits of doors and their operating mechanism.

All of us, probably on account of the necessity for economy, have been giving more attention to our maintenance cost per car-mile than to the fact that the car is not as pleasing to the public as might be desired. Our first job, therefore, is to raise the standard of maintenance so as to eliminate noises resulting from loose or worn parts. After that the use of fiber and lead or other sound-deadening materials may be experimented with profitably.

In my opinion, noise reduction is a progressive problem, and if we are able to control what we now consider the loud and disagreeable noises in our equipment, other noises will become apparent and seem objectionable that at the present time are not giving us any concern. For instance, if all other noises were quieted, the noise of a compressor would probably be very objectionable. Also, the drumming reflected to the car roof from the trolley wheel would probably become objectionable. In other words, noises which are not taken into consideration at all at the present time eventually may become an annoyance. Consequently there is a big job ahead on our old equipment.

Modern Methods an Economic Factor in Car Maintenance*

BY HENRY S. DAY
Manager Transportation Division, Westinghouse Electric & Manufacturing Company, Boston, Mass.

IN THE many discussions of modernization very little has been said of the need of equally modern methods of maintenance and the savings that could be accomplished by them. In what follows I am using the electric car as the dominating factor because all things on an electric railway start and finish at the car. The universally accepted method of discussing economies of operation is by comparison, and to this end I will quote costs and describe practices gathered from some 50 roads during the past 18 months.

On four roads, where operating conditions are similar, the total mechanical department cost per car per year was in round numbers: Road A, $866; Road B, $950; Road C, $1,200, and Road D, $1,800. On each of these roads the annual car-miles was practically the same, the cars and equipment were equivalent in weight and power and were built largely by the same manufacturers at approximately the same time. It is interesting to note that on Road A 60 per cent of the equipment was modern and on Road D there were practically no modern cars or equipment.

The Northern Texas Traction Company, which at the time of the Coffin award showed a maintenance cost per car-mile of 1.9 cents, was operating 85 per cent modern light-weight cars and the Eastern Massachusetts Street Railway, referred to as road A, which was operating with a cost of 3.5 cents per car-mile, had only 60 per cent of its cars of the modern light-weight type.

Road A, with a cost of $866 per car per year, has a definite and constructive overhaul program carried out strictly along modern lines, while road D, with a cost of $1,800 per car per year, has not overhauled its cars for 6 years. On road B, with a cost of $950 per car per year, the low cost was obtained almost entirely by modern methods of maintenance, as all passenger cars in service are of composite wood and steel double-truck type, the average weight being 42,000 lb.

It seems surprising that cars of the same type and weight, not infrequently built by the same car builder, equipped with the same motors and in equivalent service should cost some $900 more per year operating in one city than it did in another.

The road that was spending $1,800 per car per year had more than 300 cars in service. If this operator had gotten his cost down to $866 he would have saved more than $900 a year on each car. This would have reduced his mechanical department costs about $270,000 per year, and would have wiped out the operating deficit.

Figures obtained from nine roads showed that the average cost for material only on each road ranged from $22.08 to $63.04 per motor per year. The additional labor charges in the total cost of maintenance varied from 47 per cent to 73 per cent of the material cost.

On 10 roads the total cost of materials and parts for 17,469 motors was $410,272, or an average cost per motor per year of $23.48. With the labor added this makes the cost per motor around $50 per year. On these same roads the material only charged to car account for electrical equipment for

---

*Abstract of a paper before the New England Street Railway Club, Boston, Mass., Dec. 4, 1924.

four-motor cars, showed the cost per car per year to range from $113.42 to $268.18. These great discrepancies in cost at least hint that the maintenance methods employed lacked standardization or, if you please, modernization. To bear this out it is found that a gear, armature winding, bearing or other part has a much longer life on one road than another, although made by the same manufacturer out of the same material and put to work in the same service.

The question is frequently raised that local conditions create influences that cannot be controlled, particularly those of the weather and elements. We used to think that the worst thing that could happen was a snowstorm. This idea is becoming out of date, with a good many others. For example, in the past 5 years the average per cent of armatures in service rewound by the Montreal Tramways is 9.36. On this road the average motor performance per armature rewound in the 5-year period was 252,200 miles. On the basis of 36,000 miles per year an armature would go 7 years between windings. So if equipment is in good condition "local conditions" are not the factor in operating costs that they have been claimed to be.

Recently an association of equipment men published two reports, showing cost per 1,000 car-miles and miles per pull-in. The reports were gotten up to show the improvement brought about by the good work of the association, which apparently was very effective. The striking thing about these reports seemed to be that in a group of eight roads, the total mechanical department maintenance per 1,000 car-miles ranged from $18.43 to $38.13, and the total miles per pull-in from 6,189 to 46,062. It is also significant that the cost of operation on the road with the poorest showing in pull-ins was greater than on the road with the best showing. To continue the comparison, a road in New York state is operating motors with the original gears, gear cases and some of the pinions which were placed in city service 10 years ago, still in good condition. On this road, operating about 100 revenue cars, one man does all the winding, using only a part of his time. A road in Michigan rewound, last year, 125 per cent of the armatures in service.

Different Bases of Overhaul

Some roads inspect and overhaul on a mileage basis, some on a time basis, some on a watt-hour consumption basis. Others carry on inspection and overhaul by a system of light and heavy repairs as necessity dictates or equipment failures make compulsory. Overhaul periods on different roads vary from 45,000 miles or about 16 months between overhauls to 100,000 miles or about 33 months.

As a matter of fact any of the overhaul and inspection systems previously mentioned will keep cars in service with what is generally considered dependable operation. But it is also equally a matter of fact that but few of these methods keep cars in service economically when the possibilities of that economy are really analyzed.

Cars can be kept in service and maintained at low cost and with infrequent failures when new. Therefore, the system of inspection and overhaul that perpetuates the original condition, of course taking into account the yearly increasing age, is the one that will come closest to this standard and result in the lowest cost. A system like this will bring the cost of maintaining the average city street car down around $1,000 per year, with only approximately 5 per cent of the total cars out of service for overhaul, paint, collisions and running repairs. Today it is not unusual to find anything from 5 per cent to 25 per cent of the cars out of service for various reasons. The annual dead car hour cost is equal to a big sum.

The electric railway operator must come to the view point that constructive economy lies in higher standards and better methods, and that truly cheap maintenance means the care of rolling stock, power houses, line, and track along the lines intended by the engineer and manufacturer who was originally responsible for their production. That some operators have not done so, and have daily paid for it is evidenced by the very discrepancy in costs and operating records obtained from different roads. There seems no logical reason why two cars or equipment units made by the same manufacturer and placed in service at the same time in different places should at the end of a few years show widely varying results. Yet such is the case—neither can there be any question that the result is in direct ratio to the degree of skill and care exercised in the upkeep.

It is not unusual to find workmen with little training or skill and no comprehension of fits or close measurements, dismantling, repairing and assembling equipment and apparatus which had to be designed and built to what were practically micrometer specifications, in order successfully to meet operating conditions.

Modernization of methods of course means modern shops, tools and facilities. Baking ovens, spray painting, spray washing, large lye vats, power operated cranes and trucks, electric and gas welding, heat controlled babbitt pots, pneumatically or electrically operated hand tools are modern necessities. Light, comfortable shops, arranged to economize time and do away with hand labor will in themselves permit large economies. But these things alone will not reach the economies that can be attained by modernizing methods, which really mean constructive planning for and co-ordinating of the maintenance demands according to the character and requirements of the physical property. Higher standards and thorough execution of constructive maintenance schedules on a budget basis with an accurate method of tabulating costs backed up by engineering supervision and advice is another way of applying modernization of methods to any property.

For some reason hard to explain, this question of maintenance has never seemed to come into its own. The day isn't coming, but is already here, when reduced operating costs are going to decide to a large degree the question of profitable operation.

Quantity Production of Renewal Parts*

By H. R. Meyer
Westinghouse Electric & Manufacturing Company

An analysis of several railway properties indicates that a careful study of maintenance methods with more thought given to the selection of renewal parts has been materially reflected in the earning capacity of these properties. Nine times out of ten the cost of the renewal part itself is only a relatively small percentage of the cost of replacement. The big costs are in the removal of the car from service and the labor cost.

A general survey of the renewal part production in this country will show that the great majority of electric railways manufacture their own renewal parts to a greater or lesser degree and the numerous independent manufacturing concerns are also engaged in this business, with the result that large quantity production is not practiced. Many electric railway men are of the belief that they can manufacture their renewal parts cheaper than they can buy them. In some instances this belief may be justified, but in the great majority of cases it is not supported by facts. Several companies which have made a close study of this subject have learned that it was a mistaken policy.

Manufacture of renewal parts by an operating company is entirely uneconomical from the standpoint of manufacturing standards as they exist today. The mechanical department of a street railway is fundamentally a maintenance organization. This organization is laid out on lines almost entirely foreign to that of a manufacturing company in that its work consists in the repair of apparatus rather than its design and fabrication. In some cases the plea is made that the use of maintenance men for manufacturing purposes is warranted on the basis that there are many occasions when some of these men have nothing to do. If this is actually the case, then there is room for improvement in the layout of the maintenance work. If the street railways had today a suitable system of cost accounting in the shops, we are firmly convinced the records would show that the cost of manufacturing is higher than the cost of the best material which can be bought on the market today.

On an average, the number of pieces of any one part is not large enough to warrant the setup required for the production of that part for one operating company. As the cost of the setup and handling operations must be included in the total cost of the job, each piece when a small number is involved must bear its share of this setup. This is too great a percentage of the total cost of the piece. In a plant which manufactures nothing but renewal parts for general maintenance consumption, the price of the unit can be based on large quantities, as the shop load for the particular part in question can be figured on the total number of completed pieces of apparatus in use throughout the country and not on just one property.

---

*Abstract of a paper presented at the convention of the Pennsylvania Street Railway Association, Harrisburg, Dec. 5, 1924.

Have you ever considered the question of the proper tools required for manufacturing any part in quantities at a low cost? Each time another concern takes up the question of manufacturing a part which is already on the market, the cost of a new set of tools, jigs and fixtures is involved. This is a very uneconomical procedure and tends to keep the cost of a product up. Probably the most serious phase of this situation lies in the fact that as a rule the tool equipment is insufficient for an accurate reproduction of the renewal part. It stands to reason that to keep the cost down as few tools as possible are going to be made. This is not just a general statement but rather the result of many comparisons made between standard parts and those of other manufacture.

To manufacture renewal parts which will pass inspection as called for by the drawing information, the best of machinery equipment is required. A renewal part to give satisfactory service must be made to the exact dimensions of the part which it replaces. If this is not the case, the cost of a second replacement in labor alone would more than offset any saving which the home manufacture made. A survey of the street railways which was made a very short time ago showed that the average age of lathes now in service was twenty years. Manufacturing experience indicates clearly that close dimension work with duplication of parts cannot be obtained at low cost with such equipment. As the operation of the complete apparatus is dependent on the design and manufacture of the integral parts, it is evident that the tools for the renewal parts must be as near perfect as it is possible to obtain them. Only a good load factor will permit the investment for such tools.

The materials which go into a renewal part are of as much as if not more importance than the general appearance. Often is it possible to obtain at a low price reproductions of standard parts which resemble somewhat the high grade article. The question is, however, of what material is it compounded? The manufacturer of renewal parts should be constantly working toward the ultimate goal of perfection as it affects maintenance rather than that of first cost. To do this it is necessary to keep in touch with up-to-date research developments in materials and processes. A corps of trained engineers should be working on these problems at all times, testing all commercial products for the best and devising new methods of obtaining high quality materials when they are not available on the market. No materials should be used which do not come up to definite specifications laid down by these engineers. This service can only be available where the renewal parts receive only a very small proportional share of the expense.

When the operators manufacture their own parts, the materials for the fabrication are bought on price and hence are not necessarily of the best. An examination made of the materials used in a number of coils proved this point almost conclusively. Scrap materials for such items as bearings may be of almost any composition by the time they are cast, and hence the wall of the bearings may be brittle and coarse grained in structure, all of which tends to lessen their life.

As a rule, the men employed in the manufacture of renewal parts are inherently maintenance men. However, in many cases their time is split between the maintenance of equipment and the manufacture of parts. The supervisory force employed in the manufacture of renewal parts in most cases also has charge of the maintenance work. Does it not seem probable that under such conditions either one or the other of these two duties will suffer through this combination? The needs of an operating company in its maintenance work are so diversified and the quantities as a rule are so small that the support of a complete and separate manufacturing unit hardly seems justified.

The Question of Tolerance

Not so many years ago the question of tolerance on renewal parts as they affected the maintenance was one of seemingly minor importance. With the improved maintenance methods of today, and hence a greater appreciation of the necessity for correct tolerances, this question is of foremost importance in some of the major problems. You realize the importance of correct tolerances on your axles, wheel and gear bores because the effect of incorrect tolerances is immediately apparent in loose wheels and gears. This is not so true on many of the other parts of the equipment, as they will at least operate in some fashion. If you are subject to an epidemic of hot bearings and consequent troubles, you will become vitally interested in this question of tolerances and the effect when the improper ones are used.

Consider the question of brush-holders. The original manufacturer is very careful to see that the proper dimensions are adhered to from a consideration of neutral setting. If this question of neutral point of the motor is a vital one, then it is very necessary that all renewal part brush-holders be made to the same dimensions as the original. Unfortunately there are many renewal part brush holders in the manufacture of which this point is entirely neglected.

Probably in no way is the answer to tolerances so well exemplified as in the case of armature bearings and armature bearing housings. This particularly as it applies to change in gear center distances, overheated bearings and poling of armatures, with especial regard to lubrication. The life of a bearing shell is dependent to a very great extent on its fit in the housing. A loose fit of the bearing not only shortens its own life but makes necessary in many cases the reboring of the housing before a new bearing should be used. Noise in gears is mostly attributable to worn gears. However, a very large percentage of this noise is due to improper meshing caused by incorrect gear center distance. The wear of gears and pinions is increased by changes in gear center distances due to worn and improperly fitting parts. New gears and pinions under these conditions will be noisy.

Many renewal parts are made to drawing on which no tolerances whatsoever appear. Some of these drawings are made up by measuring parts for which, if tolerances were allowed, an error is bound to creep in.

Probably no one thing contributes more to the successful operation of a renewal part than the inspection which it receives before it leaves the point of manufacture. Adequate inspection of parts costs money, but it is just one of many things which must be done to service properly an operating company's requirements. Here again the load factor on any renewal part must be large enough so that each part will only have to bear a small proportion of the cost. If a clear conception of the importance of tolerance is conceded, then the importance of inspection is understood. This question of inspection is often neglected in the manufacture by operating companies.

In some cases it has been found that stocks of renewal parts exist in operating storerooms which far exceed the requirements for many years. This condition has been brought about by the necessity for making large quantities to keep the cost down. Quite a number of these parts are for apparatus which has become obsolete and therefore the remaining stock represents a total loss. The book value of this material and the interest loss is another factor which tends to offset any estimated gain through internal manufacture. When the manufacturer stands ready to protect your needs by local stocks at all times there is very little argument left for the operator to manufacture his own parts.

One large operating company estimates that by eliminating the manufacture of parts it will reduce its payroll by very nearly $100,000 per year. This does not mean a total saving of that amount, but a very, very good percentage of it will show up as a saving.

Indorses Better Business Methods

At the last meeting of the executive committee the policy committee was authorized to draw up a resolution indorsing the work of the Better Business Bureau and the National Vigilance Committee. The resolution follows:

"Recognizing the effectiveness of the work being done by the National Vigilance Committee and the Better Business Bureau in protecting the public against fraudulent, semi-fraudulent and hazardous investment propositions, this executive committee hereby indorses the work of both organizations. It urges member companies to support these organizations locally and nationally and to co-operate with them in whatever manner seems advisable."

American Association News

Arc Welding Discussed Before Metropolitan Section

A. G. BISSELL, arc-welding engineer of the Westinghouse Electric & Manufacturing Company, was the principal speaker at the meeting of the Metropolitan Section of the American Electric Railway Association in the auditorium of the Engineering Societies Building in New York on Dec. 12. His subject was the "Metallurgical Analysis of Electric Arc Welding" and he illustrated his remarks by means of lantern slides. He said that an electrode wire of hard drawn mild steel contains an average chemical composition of carbon, 0.16; manganese, 0.56; phosphorus, 0.032; sulphur, 0.024, and silicon, 0.016 with a tensile strength of 100,000 lb. per square inch. In passing through the arc, this metal in the molten and vaporized states comes in contact with the elements of the air, the extent of this contact being determined by the length of arc held by the operator. The shorter the arc, the less the metal is affected by the atmospheric elements. At the temperature of the arc the main elements of the air, oxygen and nitrogen, have a great affinity for the metals in the arc stream. The result of this affinity is that the nitrogen and oxygen combine with the elements of the wire to form oxides and nitrides. The carbon of the wire combines with the oxygen of the air to form carbon dioxide and carbon monoxide. Both of these compounds are gases and escape. The oxides of iron, manganese and silicon float to the surface of the molten metal as slag. The phosphorus and sulphur are altered but little. The nitrogen combines mainly with the iron. Some of each of the oxides and nitrides are scattered throughout the metal, but the extent of this is determined by the amount that is permitted to enter by the operator. An analysis of the metal after passing through the arc shows the following elements: Carbon, 0.05; manganese, 0.18; phosphorus, 0.031; sulphur, 0.036; silicon, 0.011; nitrogen, 0.114-0.138, and oxygen, 0.55-0.25 per cent. The tensile strength is from 55,000 to 62,000 lb. per square inch.

By holding the arc between ⅛ in. and 3/16 in. the arc stream is completely surrounded by an envelope, mainly of iron oxide vapor, that prevents the active oxygen and nitrogen on the outside from coming in contact with the active elements on the inside and permits a fairly pure metal to be deposited on the work.

By melting the steel wire and again solidifying it cast steel is produced, and at the same time the crystalline structure of the plate metal in the immediate vicinity of the deposit is altered. Photomicrographs show a section of metal extending from the added metal through the line of fusion into the plate in one layer. The light metal is of a cast structure. This is the deposited metal and consists of iron of the analysis given above. This structure blends into a different structure at the line of fusion between the plate metal and the deposited metal. The heat conducted through the plate away from the line of fusion produces structures corresponding to the temperatures reached. The dark, coarse structure is characteristic of an overheated steel and is brittle. This material extends about 0.015 in. into the plate. Further into the plate the grains grow smaller until the minimum size is reached at the point where true annealing occurs. Here the temperature reached is about 780 deg. C., or just above the critical point of the steel. The material at this point has a tensile strength of about 60,000 lb. per square inch and an elongation of about 25 to 30 per cent in 2 in. Further on the structure again coarsens, blending into the original structure of the plate. The crystals of each metal are perfectly enmeshed. The added metal may be identified by the inclusions of oxide and nitride that appear as black specks in it.

The principal discussion was by J. S. McWhirter of the Third Avenue Railway. The general opinion was expressed that electric railway operators had much to learn from the applications of arc welding carried out by the steam railroads.

Myles Lambert of the Westinghouse Company responded to the invitation of President Thompson of the section by addressing his remarks more particularly to the young men in the industry, and by making a plea for everybody engaged in electric railway work to do more to sell the industry to the public. Mr. Lambert said that the educational opportunities of the day were almost limitless and he urged all the men in the industry, particularly the younger men, not to leave any stones unturned in their efforts better to fit themselves for their jobs and for their work as citizens and as members of the community. He said that the interest of railway men everywhere was not only in the perfection of the physical apparatus with which they worked, but with the problem of studying how people regarded the service that was being rendered.

Secretary Hodges said there was a balance of $1,259.46 in the treasury and that since the last meeting the membership had increased 157, or from 569 to 726 members.

Mr. Thompson said that a broad program had been laid out for the year—one that he hoped would touch intimately the work of every man engaged in the industry. On each property included in the territory covered by the Metropolitan Section at least one man has been appointed who will keep in touch with the members in order to find out what subjects were uppermost in the minds of the men. In that way it could best be learned what the men desired to hear discussed.

May Singhi Breen and her Syncopators furnished the principal entertainment. They were roundly applauded. Miss Breen broadcast from Station WEBJ of the Third Avenue Railway, and the stage of the auditorium in the Engineering Building was equipped with a microphone and wires and announcements were made over the microphone to the invisible audience, but at the conclusion of the performance the announcer detached his instrument and darted off the stage while it was dawning on the audience that the broadcasting stunt was only a hoax.

Committee of 100 Disbands

ITS purpose accomplished, the Committee of 100, which was formed for the purpose of furthering the dissemination of correct information regarding the industry, will disband Jan. 1. Announcement to this effect was made in a letter sent by Gen. Guy E. Tripp, chairman, to each member of the committee. The letter follows in full:

"The Committee of 100, of which you are a member, will be dissolved on Jan. 1, 1925, on which date the American Electric Railway Association will take over its funds and work, and as chairman, I wish to take this opportunity to report to you what we have accomplished in the 5 years of our existence.

"The work for which the committee was originally organized, that of saving electric railways from seemingly imminent danger of general bankruptcy, by telling the public the facts about the industry, has been accomplished. Machinery for reaching the public with the industry's story was set up shortly after the organization of this committee, and this machinery has been perpetuated in its original form, enlarged and kept functioning under funds raised by the committee ever since.

"Initially, in 1919, the committee funds were expended in giving to the public facts developed by the Federal Electric Railways Commission, and such good results were accomplished by the publicity machinery then set up that it was transported to the American Electric Railway Association headquarters in New York, and since that time has functioned under the name of the Advertising Section of the association. Included in the beneficial accomplishments of this Advertising Section in the last four years are these:

"'Established a point of contact between the electric railway industry and writers for newspapers, magazines, financial papers and other publications interested in electric railways through which they could obtain authorized information, including statistics, regarding the electric railway industry. This service, by its frank and honest dealing with publications, enjoys the highest standing and today is being utilized throughout the country.

"'Encouraged electric railway companies to improve their public relations by frank dealing with the public, and caused the number of companies using publicity and advertising to increase during the 4-year period from about twenty to more than three hundred. The total amount of money now being spent for electric railway advertising and publicity annually chiefly through local company channels is estimated at $3,000,000.

"'Originated an advertising service for the dissemination through electric railway companies of posters, suggested newspaper advertisements, booklets, etc., carrying authenticated information about the industry. This service is supplied regularly to all electric railway companies in the United States.

"'Aided in the organization of state companies on public utility information and arranged a co-operative arrangement with them whereby newspapers, state legislators, city officials and libraries and colleges in the 37 states where the committees operate are supplied regularly with electric railway material.

"'Enlisted for the first time the co-operation of manufacturers of electric railway materials employing some 200,000 men in telling the facts about electric railways to the public.

"'Made personal surveys of and gave national publicity to such outstanding electric railway situations as those which have arisen in Des Moines, Iowa; Okron, Ohio; Saginaw, Mich.; Toledo, Ohio, and Bridgeport, Conn., in which the bus sought to supplant electric cars.

"'The Advertising Section has worked in close harmony with the executive committee of the A.E.R.A. and all of its activities have been carefully supervised by leading executives of the industry. The universal opinion of association executives familiar with the section's work is that it has accomplished effective results and that its efforts should continue along the general lines followed heretofore.'

"Happily, the finances of the association are in such condition that it is now able to carry on the educational work heretofore financed by the Committee of 100. Hence, the executive committee of the association on Nov. 21 officially made arrangements for financing the work after Jan. 1, 1925. Effective that date, therefore, the Committee of 100 will stand dissolved.

"Coincidentally, the executive committee adopted a resolution thanking the Committee of 100 for the excellent work that it has done since its creation. To this I wish to add a word of appreciation. This committee doubtless has been of great service to the industry, and I thank you personally for the assistance that you have rendered."

Heavy Traction

A MEETING of the heavy electric traction committee of the Engineering Association was held at association headquarters, New York City. on Dec. 17. Members present were J. C. Davidson, chairman; A. H. Armstrong, J. M. Bosenbury, H. F. Brown, Morris Buck, H. W. Cope, J. H. Davis, J. T. Hamilton, Norman Litchfield, J. O. Madison, L. S. Wells and C. R. Harte, sponsor.

Mr. Wells was appointed chairman of a sub-committee to review existing standards. It was suggested that a representative of this committee review the subject of zinc coatings for steel, now under consideration by a sectional committee of the American Engineering Standards Committee.

Mr. Brown, chairman of the sub-committee on revision of the bibliography of heavy electric traction, stated that the work has been carried out by Prof. Warner. This work is now nearly complete as regards American references. A motion was adopted that the American portion of the work be completed. The subject of collection of data on branch-line electrification and self-propelled cars was continued, with A. H. Armstrong as chairman of the sub-committee. The study of train operation, with particular reference to articulated trains, was referred to a sub-committee, with A. H. Daus as chairman. A sub-committee was appointed to check up and revise the tabulation of mileage, car and locomotive data of electrified steam railroads, with Mr. Cope as chairman.

Valuation

A MEETING of the committee on valuation of the American Association was held at association headquarters, New York, on Dec. 15 for the purpose of organizing and laying out the work for the coming year. Those present were F. W. Doolittle, New York, chairman; Francis Blossom, New York; H. A. Clarke, New York; W. F. Downs, Philadelphia; J. A. Emery, New York; T. E. Francis, St. Louis; C. W. Gillespie, New York; L. R. Nash, Boston, and A. S. Richey, Worcester, Mass.

It was decided to continue the work which the committee has been carrying on for several years in clarifying the status of valuation work. Several new subjects were proposed and discussed. Their inclusion in the program for the year was left to the discretion of the chairman. The next meeting will be held in connection with the Midyear Meeting at Washington.

Power Generation and Conversion

A MEETING of the committee on power generation and conversion was held at association headquarters, New York, on Dec. 15. Those present were L. D. Bale, chairman, Cleveland; C. E. Bennett, Atlanta, Ga.; W. E. Bryan, St. Louis, Mo.; C. A. Butcher, East Pittsburgh, Pa.; H. W. Codding, Newark, N. J.; H. T. Connolly, Annapolis, Md.; N. R. Love, Denver, Col.; F. W. Peters, Schenectady, N. Y., and V. H. Mueller, representing G. W. Saathoff, New York, N. Y.

Discussion centered on the various subjects which had been assigned to the committee for consideration and report during the coming year. Plans were outlined for carrying on the work, and four sub-committees were appointed. In regard to automatic substations, it was decided to review last year's report and add new information, and also to devise a classification to take care of substations manually operated all the time or part of the time and to include substations having semi-automatic and full automatic protection. The subject of remote supervisory control is to be studied with a view of obtaining additional data in regard to systems used for recording and indicating loads. New developments in supervisory control are to be considered.

A program was laid out in regard to the subject of ventilation and noiseless operation of substations. It was decided that test data in regard to ventilation as affecting temperature were desirable, and the committee decided to lay out a system of tests that should be made so as to collect data. The intention is to have some very complete tests made at various railway properties. It was considered desirable to obtain a steel bolt specification, and the committee is to go over the field and obtain specifications where possible, in order to make definite recommendations.

G. W. Saathoff was appointed chairman of the committee to study existing standards and also of the committee to obtain steel bolt specifications; H. W. Codding was appointed chairman of the committee on automatic substations, and F. W. Peters was appointed chairman of the committee on ventilation and noiseless operation of substations. W. E. Bryan is chairman of a special committee consisting of members of the power generation and conversion committees and the power transmission and distribution committees to study and codify power failures.

Power Transmission and Distribution

THE organization meeting of the power transmission and distribution committee of the Engineering Association was held at the Engineers Club, New York, on Dec. 15 and 16. The following subjects were assigned to sub-committees for consideration:

Concrete pole design, F. McVittie, chairman; block signals, J. M. Waldron, chairman; catenary overhead construction, A. Schlesinger, chairman; composition and wear of trolley wire, H. S. Murphy, chairman; temporary connections to trolley wire, J. F. Neild, chairman; overhead construction for trackless trolley, F. McVittie, chairman; return circuit, J. Walter Allen, chairman; review of Manual sections, Adrian Hughes, Jr., chairman. D. D. Ewing, J. F. Neild and A. Schlesinger were appointed to represent the committee on the joint inductive co-ordination investigation.

It was decided to hold a meeting of the committee at Chicago some time in March and a final meeting in New York at the call of the chairman.

The first day's session was given over to a general discussion of the subjects for the year, after which the main committee meeting adjourned and the various sub-committees met to outline their work specifically.

Those present were C. H. Jones, chairman; J. Walter Allen, S. M. Day, J. H. Drew, Charles Gilman, H. W. Griffin, C. J. Hixson, C. L. Hancock, H. W. Cooke, F. McVittie, H. S. Murphy, W. J. Quinn, W. Schaake, A. Schlesinger, J. M. Waldron, F. J. White, J. C. Damon representing W. H. Bassett, M. B. Rosevear, sponsor, and G. C. Hecker, special engineer.

The News of the Industry

Atlanta Traffic Study Presented

Expert's Report Contains Several Unusual Suggestions—Moving Platform Among Them

Removal of all street car tracks on Peachtree and Whitehall Streets between Ellis and Mitchell Streets in the downtown section of Atlanta, Ga., and the installation of moving underground platforms for the transportation of pedestrians at an approximate cost of $2,500,000 are two of the principal items in the report of John A. Beeler, New York, who has been engaged for the past six months in making a traffic survey of Atlanta at the joint request of the City Council and the Georgia Railway & Power Company.

Other recommendations include the erection of viaducts over the railroad tracks at both ends of the old Union station at Pryor Street and Central Avenue; the rerouting of practically every street car line in the city; the establishment of a co-ordinated coach system to eliminate the jitney problem by operating buses in connection with the street car system; the widening of several principal streets and the creation of alternate trolley and automobile boulevards.

While exact figures on the recommendations have not yet been made public, it is understood that it will cost $10,000,000 to carry out all the changes recommended. According to Mr. Beeler his recommendations will, if put into effect, take care of Atlanta's traffic problem for at least 30 years.

The most unusual feature of the recommendation .is, of course, the proposed moving platform. The subway would be equipped with three continuous platforms. One set of platforms would run north on one side of the street and the other south on the opposite side. The inner walk would move at the rate of 6 m.p.h., the intermediate one at the rate of 4 m.p.h., and the outer one, or one nearest the stores, at the rate of 2 m.p.h.

According to Mr. Beeler it would be impracticable to widen either Peachtree or Whitehall Street. It is felt, however, that the elimination of the railway and the construction of the subway will not only solve the problem but will be a real advantage to merchants in the downtown section.

Mr. Beeler has also proposed the construction of alternate automobile and trolley boulevards. Present car lines would be rerouted on the adoption of this system, and the lines would go straight through town, some north and some south, looping in the suburbs to form a continuous system.

The four streets on which cars are to be operated would provide for one north and one south line on each of the principal thoroughfares, and this would do away with all of the loops, crossings and turnings in lines which make Atlanta's traffic situation a nightmare at present.

Another important recommendation is the operation of an auxiliary system of buses by the railway as the best means of meeting jitney competition. This section of the report contains a carefully worked-out plan for bus lines to supplement street-car lines.

The entire report is in eight sections. It includes recommendations on the moving sidewalk subway, the construction of the viaducts across the railway tracks, the creation of alternate automobile and street-car boulevards, the rerouting of car lines to form a simpler and more effective system, and the operation of bus lines to supplement street car lines and compete with jitney competition.

Business Will Be Improved by Reparations Settlement

Herbert Hoover and Owen D. Young Outline Results Expected from Adoption of Dawes Plan—Mr. Young Said Plan Could Not Have Been Adopted Without American Participation and Must Have American Co-operation to Succeed

COMMERCE will be restored, productivity increased and employment bettered as the result of the adoption of the Dawes reparations settlement. These results were predicted by Herbert Hoover, Secretary of Commerce, at a dinner held in New York City on Dec. 11 in honor of Owen D. Young, co-author and first administrator of the plan. This relief will apply not only to Germany, he said, but to the whole world.

The German reparations question had become one of the world's most dangerous inheritances from the war. The failure in its adjustment had poured an increasing stream of conflict into international life, carrying with it political jeopardy and economic demoralization. The wound to the present complex and intricate civilization was so deep and so vital that many had despaired lest statesmanship should be unequal to the task of curing the ills. Today there are many problems yet unsolved. None of them, however, is so dangerous as those that one by one have been met successfully in the six years since the armistice.

The payments provided in such settlements must find their substance from production and economic services rendered. These international obligations are huge burdens, but in the course of years burdens shrink as productivity grows. In a peaceful world international trade is doubled once in every score of years. It was contended that the world would break under the burdens of the Napoleonic wars, but about twenty years later they bore so lightly that their dangers were no longer discussed. The settlement to which Mr. Young contributed so much clears the atmosphere and the processes of industry and commerce will quickly provide strength to meet the burden, if the world keeps peace.

Manufacture and distribution on a vast scale, the foundation of present high standards of living, can be accomplished only through the development of great units of production, said Mr. Hoover. With their development have come innumerable problems of public relationship and public responsibility. A rapid evolution and perhaps a silent revolution are being witnessed to-day in the relationship of great business to the social system. The present struggle is to preserve the fundamental stimulus of action, of initiative, and competition, to hold open the avenues of opportunity. At the same time an effort is being made to gain the benefit of co-operative action. There is no greater responsibility than that imposed upon the headship of great industries, for from this leadership and vision must come not only great contributions to economic progress, but upon it depends the solution of the many social problems. Mr. Hoover said that Mr. Young has been the expression of this type of leadership.

The Dawes plan is strictly economic and has nothing military or political in it. This was emphasized by Mr. Young. He said the plan does not mean the completion of Europe's reconstruction. This is still in an initial stage. It begins to look, Mr. Young said, as if there were real hope of a new day in the world—a day in which human beings in all countries may live peacefully and develop and work and save. The plan could not have been created or adopted without America and it cannot succeed without the co-operation of the people of America. The agencies of American business must all co-operate in support of the plan. American men of commerce, industry, agriculture and finance must aid in the restoration of the credit and currencies of the principal commercial nations.

At one point in his speech, Mr. Young called for a definite foreign policy that would be free from "the horseplay of domestic politics." He said that such a policy would advance the peace of the world. As an alternative he suggested putting the State Department in a non-partisan position so that all citizens, including senators, could speak and act on foreign policies, "free from thought of the charge of being traitor to the political party of their affiliation."

The dinner was arranged by a committee headed by A. C. Bedford, chairman of the Standard Oil Company of New Jersey. Mr. Young was congratulated by Secretary of Commerce Herbert Hoover, Richard F. Grant, president of the Chamber of Commerce of the United States, and by the Prime Ministers of Italy, Belgium, Great Britain and France. Mr. Young's achievements as ad interim Agent General of Reparations Payments were recognized by the French Republic, which invested him with the cross of a Commander of the Legion of Honor.

George W. Wickersham, formerly Attorney-General, presided at the dinner to Mr. Young. A telegram was received from President Coolidge in which he said:

> The commission's work is now recognized as a great contribution to re-established economic order in Europe and the distinguished part which Mr. Young bore has earned for him the gratitude of people on both sides of the Atlantic.

Vice-President-elect Charles G. Dawes also sent his congratulations. Secretary of State Hughes telephoned his tribute from Washington. The remarks made by Mr. Hughes were relayed to the diners through a radio loud speaker.

Newspaper Misapprehension Corrected

Chicago Surface Lines Points Out Differences Between Chicago and Philadelphia Fares in an Effort to Correct False Impression Created by Editorial Comment

READERS of the Chicago *Journal* were advised in an editorial in the issue of Dec. 9 "to go back and walk around," a quoted passage from *Service Talks*, published by the Philadelphia Rapid Transit Company, "before they can be expected to grasp it." The passage was the one referred to in the ELECTRIC RAILWAY JOURNAL for Dec. 13 in which Mitten management and the 5-cent fare were discussed. The Chicago *Journal* suggested to its readers that "the spectacle of a street car management actually fighting for lower fares instead of high ones impresses the local straphangers as something fantastic—too good to be true." As the Chicago paper saw it, "Mr. Mitten was actuated by shrewd common sense as well as by regard for public convenience in taking the stand he did" on the 5-cent fare. Furthermore, the Chicago *Journal* said that the aid of the car crews in Philadelphia had been enlisted to such an extent "that Philadelphia got the street car habit more than any other city on earth."

G. A. Richardson, vice-president of the Chicago Surface Lines, felt that the editorial unintentionally gave a wrong impression and was extremely unfair to his company and to the riding public of Chicago. Mr. Richardson, who was vice-president of the Philadelphia Rapid Transit Company from 1919 to 1922, accordingly wrote to the editor to explain the situation. Mr. Richardson said in part:

> What Mr. Mitten wanted, to use his own words, was "a straight 5-cent fare with the elimination of all free transfers and 3-cent exchanges." You praise Mr. Mitten for this and apparently recommend it for Chicago.
>
> The Chicago Surface Lines carried passengers last year at an average rate per ride of 3.88 cents. On the basis of a straight 5-cent fare, such as Mr. Mitten suggested, each passenger would have had to pay 5 cents every time he boarded a car, no transfers being issued. The earnings of the Surface Lines from passenger service last year amounted to $56,987,000. With the straight 5-cent fare which Mr. Mitten advocated for Philadelphia and which your editorial indicates would be welcome here, our gross earnings from this source, on the basis of total rides, would have been more than $71,285,000, or $14,000,000 more than we received, and as no transfers would have been required, we would have saved the cost of printing and handling them, amounting to about $200,000.
>
> Your editorial also conveys the impression that the Philadelphia properties are paying enormous wages to their men, wages having increased 151 per cent. The Chicago Surface Lines pays its trainmen 75 cents an hour. At present the Philadelphia properties are paying 65 cents an hour, but a wage increase to 70 cents has been granted beginning Jan. 1, 1925, and in order to pay this wage increase Mr. Mitten applied for and secured from the Public Service Commission an increase in fare from 7 cents to 8, with tokens at 7½ cents.
>
> You assert that Mr. Mitten opposed this last increase from 7 cents to 8 cents. On the contrary Mr. Mitten applied for the increase. In a letter to the Mayor of Philadelphia, July 21, 1924, he said: "Our present urgent need must therefore be now met by increasing the 7-cent cash, four-tickets-for-25-cents fare. A fare of 8 cents cash, two tickets for 15 cents is now required." A temporary order for the increase was issued by the commission on his plea and it was hastened by his assertion of an immediate emergency.
>
> You also say that the riding per inhabitant in Philadelphia is more than in any other city on earth. There evidently has been some confusion in these figures. The issue of Mr. Mitten's *Service Talks* of Dec. 5, 1924, quotes a statement from the Boston News Bureau showing 381 rides per inhabitant in Philadelphia for last year. The same statement credits Chicago with 286 rides per inhabitant last year. The Chicago figure does not include the elevated system, which when combined with the Surface Lines brings the riding habit up to 356. The Philadelphia figure covering both elevated and surface lines includes 56,420,521 3-cent transfers and a number of zone fares, which are duplicate rides, and also some joint rate passengers. The true figure for Philadelphia on a comparable basis with Chicago should be 341 as compared with 356 in this city.
>
> With the recent fare increase to 8 cents and tokens two for 15 cents, effective Sept. 25, 1924, the average fare per ride in Philadelphia in October was 5.40 cents. The average fare per ride on the Chicago Surface Lines is 3.88 cents.
>
> It should be remembered that under the zone system in Philadelphia to ride, for instance, from the business district to Doylestown, a distance of less than 25 miles, a passenger must go through seven zones and pay a total of 38 cents. In Chicago on the surface lines it is possible to ride 35 miles for one fare of 7 cents.
>
> It should also be remembered that it is impossible to transfer from one surface line to another in the downtown district in Philadelphia without paying a 3-cent transfer charge, and that in no case is a second transfer given. If one wants to transfer twice, the second time he must pay a full fare.
>
> In Chicago a universal transfer system is in effect with practically unlimited transfers so long as the passenger is traveling in the same general direction.

New York Transit Inquiry Under Way

Justice McAvoy on the morning of Dec. 15 opened the hearing on transit matters in New York authorized by Governor Smith as a result of charges of neglect lodged with him against the members of the Public Service Commission by Mayor Hylan. The first witness called was George McAneny, chairman of the commission. He was on the stand all the first day of the hearing.

The second day of the hearing the special counsel for the Mayor withdrew, as did also the corporation counsel and the other attorneys for the city. This they did as a protest against the ruling by Justice McAvoy that they would not be permitted to cross-examine witnesses or to conduct examination of witnesses in an effort to sustain the charges against the commissioners. Later counsel for Justice McAvoy explained that the proceeding was an inquiry and not a trial and he cited as precedent for the action the cases of the investigation of the insurance companies and other similar proceedings.

At the opening session serious charges were made against the Mayor by the commission through Mr. McAneny. These comprised a brief signed by the three transit commissioners which reviews transit history since 1913, and particularly since the creation of the commission. It brings twenty-six charges, all showing alleged neglect, obstruction or deceit on the part of Mayor Hylan. The charges are specific, even mathematical. They allege a constant and expensive blocking of construction by the Mayor—construction of subway lines and subway car facilities. The failure of the city to fulfill its contracts for new lines, storage yards and repair shops is alleged to have held up $35,000,000 worth of facilities. In referring to the operation of buses under the jurisdiction of the city administration the brief of the commission charged that in "instances large payments have been made by the private operators to persons possessing political influence, through whose intervention such permits for operation had been secured."

On Thursday Commissioner Leroy T. Harkness testified in connection with the reorganization of the Brooklyn Rapid Transit Company into the Brooklyn-Manhattan Transit Corporation. It was alleged that the commission failed to compel the B.-M. T. and the Interborough Rapid Transit companies, operators of the city-owned subways, to set aside a proper amount of money for depreciation as provided for by the dual contracts.

John H. Delaney, chairman of the city Board of Transportation and formerly Transit Construction Commissioner, was another witness on Thursday. He disputed the testimony of Mr. McAneny that the transit companies were prevented from giving better service because of a lack of yards and declared it was not necessary to furnish "bedrooms" for all the cars. He added that he never had taken this defense of lack of yard facilities very seriously.

Strike on I. T. S. Settled

400 Miles Interurban Tied Up Six Days—Closed Shop Accepted, but No Hourly Wage Increase

Service was resumed on the lines of the Illinois Traction System, Peoria, on Dec. 13 at 5 p. m., following a strike which lasted six days. The men returned to work after a vote at which they approved the action of the executive committee of the union in agreeing to a compromise of the issues. The strike affected about 400 miles of railway. No effort was made by the company to operate trains.

The company maintained a conciliatory attitude throughout the entire proceeding. Business and civic organizations in several cities served by the company were unsuccessful in trying to persuade the trainmen's organization to submit the matter to arbitration. The company reiterated its willingness to settle on the basis of one of the original three propositions or to arbitrate the entire matter after the men had returned to work. These proposals were met with refusal in each case.

ARBITRATION PROVISION IGNORED

The committee representing the trainmen finally agreed to forego the demand for an increased wage. This left two points at issue—the closed shop and the question of time and one-half for overtime work. On the fifth day of the strike, a conference was again arranged by the trainmen's committee and officials of the Illinois Traction System, at which a tentative agreement was drawn up which included the provision that the trainmen drop their demand for increased wage but the company recognize the principle of the closed shop and agree to pay 10 cents an hour in addition to the regular pay for overtime work, and that in the future, pending negotiation and execution of a new contract, trainmen shall continue to work. This agreement, in the nature of a compromise on both sides, was referred back to the membership of the trainmen's organization for a referendum vote.

The strike followed action by the Amalgamated Association through its executive committee, issuing an order to the 350 motormen, conductors and brakemen employed to cease work at midnight on the morning of Dec. 7.

The contract under which the men had been working during the past year expired on Dec. 1. It provided for arbitration. Negotiations for a new contract began Nov. 26. The trainmen asked for an increase of 10 cents an hour in wages, a closed shop, time and one-half for overtime and a number of changes in the working conditions. The wage scale (in cents per hour) was as follows:

Motormen and conductors on freight runs	65
Motormen and conductors on sleeper runs	65
Passenger motormen and conductors promoted prior to Jan. 1, 1923	62½
Passenger motormen and conductors promoted after Jan. 1, 1923	60
Trainmen on branch lines	55 to 60

A nine-hour day prevailed in the passenger service and a ten-hour day in the freight service.

During the negotiations the company took the stand that business conditions and the financial situation in which the company found itself would not permit of a contract that would add to the expense of operation. The company also insisted that the committee of five men representing the trainmen be authorized to negotiate a contract.

The committee representing the men reported on Dec. 5 that the members of the trainmen's organization had taken a vote in favor of quitting work, if necessary, to uphold the demands of a new contract with increased pay and better working conditions. At the same time the committee notified the company that the men were ready to consider any offer the company saw fit to make, if made before midnight, Dec. 7.

A reply from the company on the morning of Dec. 6 followed in the shape of three different propositions:

1.—That the committee of five should have authority from the rank and file of our men to negotiate a new agreement; that pending such negotiations an agreement should be made continuing the last contract (except as to wages) until a new agreement should be made; that the wages finally agreed to should be retroactive to Dec. 1, 1924.

2.—While this company in its efforts to continue railway service in its territory has urgent need for reduced expenses and believes a new contract should carry with it lower costs, we are willing to co-operate to the extent of agreeing to the renewal of the recently expired contract for a period of from three to six months. This was later extended by the company to a full year.

3.—Believing that our position is fair and one that will stand honest examination we proposed that the committee and the company enter into an agreement to submit the entire matter to arbitration as arranged for in our last contract.

The trainmen's committee advised the company at 4 p.m. on Dec. 6 that none of the three propositions was acceptable and that unless the company agreed to the original demand by 10:00 p.m. the men would quit work at midnight. This was virtually a six-hour strike notice, taken by the committee without submitting the three company propositions to the members of the trainmen's organization for a referendum vote.

Track Changes Authorized in Mobile

Due to the fact that the Mobile Light & Railroad Company, Mobile, Ala., has been losing money for some time in railway operation, several changes in the trackage of its lines was allowed by the Alabama Public Service Commission at the meeting of that body held in Montgomery on Nov. 28.

The company was authorized to take up its track on the Wilkinson Street line and abandon service thereon. Permission was also granted to take up the tracks on old Government Street for a distance of three blocks. The commission's order also further provides that the company shall, in good faith, immediately take the necessary steps to operate cars over the Charleston-Beauregard and Cedar-Davis lines for the greater portion of the day on a 13-minute headway between cars.

The opinion of the commission was that when it was shown that a railway utility fails to earn a fair return on its investment, and such failure was not attributable to its fault, the utility should be allowed to make changes in its car tracks and rearrange and consolidate its service, if these changes would result in substantial reduction.

Resolution Urges Agreement on Cincinnati Loop

Fearing that continuation of a deadlock on the traction situation would jeopardize the success of the rapid transit loop of Cincinnati, Ohio, the Rapid Transit Commission passed a resolution, presented by E. W. Edwards, chairman, urging an early agreement with the city, the Cincinnati Traction Company and the Cincinnati Street Railway. In presenting the resolution Mr. Edwards stated that the time had come when it was necessary to negotiate a contract for the operation of the loop, in which $6,000,000 of the taxpayers' money had been invested. A large section of the loop would likely be ready for operation during the latter part of 1925, it was asserted.

Mr. Edwards stated that the commission had been led to believe that the controversy would have been adjusted long before now, so that there would be no obstacle in the way of making a contract for the loop. He also called attention to the fact that the car riding public, on the basis of the present rate of fare, was called upon to pay approximately $2,500,000 annually. If the controversy were taken into the courts, as the Mayor had threatened to do, the people would be deprived of the service of the loop for several years.

Baltimore Wage Increase Restores Peak of 1920

An increase of 2 per cent in the wages of its employees in operating departments was granted on Dec. 10 by the United Railways & Electric Company, Baltimore, Md. The increase, effective Jan. 1, will affect approximately 5,000 men.

The revised wage schedule briefly referred to in the ELECTRIC RAILWAY JOURNAL issue of Dec. 13, was announced at the annual meeting of company executives with representatives of the workers' organization, the United Railways Association of Baltimore. For platform men the increase will amount to about 1 cent an hour, making their minimum wage 47 cents an hour and the maximum 52 cents an hour, as compared with the present minimum of 46 cents and a maximum of 51 cents. The advance will add $155,000 to the company's annual payroll, officials said.

The wage question is but one feature of the working agreement under which the company and its employees operate, and the recent renewal of the agreement was the sixth since its inauguration.

An increase equivalent to the one just announced was granted last year. These increases restore wages to the peak point at which they stood in 1920, when 2 cents an hour was chopped off. They represent an increase of 18 cents since early in 1918, the last days of the 5-cent carfare.

Madison Company Files Increased Fare Petition

An application for an increase in fares to become effective Jan. 1 was made to the Wisconsin Railroad Commission on Dec. 5 by the Madison Railways, Madison. This application followed a meeting of a committee of the commission and the company which was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 6. The company asks for an average fare of 7 cents, although in previous meetings the plan of having an 8-cent cash fare with 17 tickets for $1 had been discussed.

The increase in fares is made necessary by the improvement plan which the company contemplates carrying out. In order to put through the present plan fully $700,000 is needed. Of this $700,000 it is estimated about $400,000 should be for replacement and $300,000 to capital account. Additional earnings of $80,000 are required for the completion of the program.

Part of the increase will be used to provide for an increase in the wages of the company's employees. It is planned to provide about $10,000 a year for this purpose. Several years ago the men accepted a wage cut of 3 cents an hour in order to keep the line in operation.

With an 8-cent cash fare and 17 tickets for $1 and taking into account the receipts of the company for last year, it was estimated that the additional revenues would range from $63,700 to $93,100, depending on the percentage of ticket sales. Last year the proportion of the gross receipts from cash fares was 60 per cent and that from tickets 40 per cent.

Cleveland Men Reject Stanley Offer

Motormen and conductors employed by the Cleveland Railway, Cleveland, Ohio, at a secret ballot box referendum, Dec. 18, voted down a proposition offered them by John J. Stanley, president of the company, as a means of terminating all differences existing between the company and the union. His offer included the following terms:

1. The term of the contract between the company and the union to be definitely fixed at five years and to extend from May 1, 1925, to April 30, 1930.
2. In case arbitration of grievances is continued, the appeal for arbitration must be taken from the decision of the general manager. In case grievances are still left to the president or vice-president for decision, this is to be final and not subject to the determination of a board of arbitration.
3. The scale of wages to be: 60, 63 and 65 cents per hour, with differentials as at present, from Jan. 1, 1925, to April 30, 1926.
4. The past records of all employees to be cleared as of Jan. 1, 1925.

This offer means a wage increase of 5 cents an hour to the men and makes definite for a period of five years the closed shop contract now existing for an indefinite period. Officials of the union agreed to submit Mr. Stanley's proposition to the men without recommendation on their part.

The Common Pleas Court some time ago threw out the award of a board of arbitration that granted the men a 12-cent an hour increase dating back to May 1 of this year. An appeal from this decision is now pending in the Court of Appeals. If the men accept Mr. Stanley's new offer, it means that the court action likely will be terminated.

Indicted Men in International Wreck to Stand Trial

Seven men who were indicted in January by the Niagara County grand jury in connection with the theft of dynamite alleged to have been used to destroy the Buffalo-Niagara Falls high-speed line of the International Railway at Ellwood Station on Aug. 14, 1922, will be placed on trial in Lockport on Dec. 22. Judge Charles Hickey of Niagara County has appointed Abner T. Hopkins as special attorney to prosecute the defendants, most of whom are former employees of the traction company.

Col. William J. Donovan, deputy attorney-general of the United States, who prosecuted the striking trainmen in the federal court at Buffalo, including former State Senator Robert Lacey, who pleaded guilty, will submit additional evidence in the dynamite case to the federal grand jury in Buffalo later this month. For more than a year Burns detectives and special agents of the United States Department of Justice have been investigating charges that high officials in the ranks of organized labor were responsible for the dynamiting. At least seven more indictments are rumored. Rewards totaling $100,000 are still offered by the International Railway for evidence in the case. Forty-two tourists were injured.

Providence Men Explain Wage Attitude

Union employees of the United Electric Railways, Providence, R. I., have explained in a letter recently delivered to E. J. Dickson, vice-president of the railway, their attitude on the wage controversy, especially on the manner of arbitration. The contents of the letter were not made known. The contract with the men expired on Oct. 31. Prior to that date the employees submitted a draft of a new wage and working agreement which called for a general increase amounting to 14 cents an hour. The present scale is 56, 59 and 61 cents. In a letter answering the demands of the union the company stated that in order to advance wages 14 cents an hour it would be necessary to raise the fare to 13 cents cash and suggested an agreement based upon a reduction of the wages of the platform men of 5 cents an hour or a rate of 56 cents. Following the rejection of this offer by the men the company made it clear that if arbitration were resorted to the award "should be determined upon the evidence presented by the company of its ability to pay a reduced scale, the present scale or an increased scale and such determination should be based upon the resources of the company as of Nov. 1, 1924." The demands of the men were referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 18.

News Notes

Advance Plan for Westchester Construction.—The Westchester County Transit Commission has proposed a $150,000,000 plan for rapid transit construction providing through trains from Westchester to lower Manhattan. The scheme would abandon the Grand Central Terminal for suburban passenger service.

May Electrify Line.—The Pittsfield-Maysville branch of the Wabash Railroad will not be operated by that road after Dec. 31, the date on which its present contract with the county expires. Engineers of the Central Illinois Public Service Company, Springfield, Ill., have been inquiring into the possible use of electricity.

Teamed for Seventeen Years.—*Surface Service*, the magazine of the Chicago Surface Lines, is promoting a contest to determine what conductor and motorman have teamed up together longest. The contest began with a challenge from one pair who have worked together for 17 years. They are Conductor Charles Levighn, 33 years in the service, and Motorman Maurice O'Connell, an employee since 1881.

Utility Courses at Oregon University.—Another university to adopt the plan of offering courses of study in public utilities is the University of Oregon at Eugene, Ore. This course is similar to those adopted by such Eastern universities as Harvard, Pennsylvania, Northwestern, Illinois and others. The courses are offered to provide modern instructional work for men and women who are looking for careers in the industrial world.

Fare Hearing Continued. — The application of the Oklahoma Railway, Oklahoma City, Okla., for a 10-cent fare, set for Dec. 6, was deferred to Dec. 8 over the objection of the company. On Dec. 8 Mayor Cargill declared the city would encourage buses on all streets occupied by the company if the increase were granted. The commission continued the hearing to Jan. 16. John W. Shartel, president of the company, then declared justice delayed is justice denied and said the bondholders must protect themselves. Early action is, therefore, expected in the federal receivership case which is now pending.

Turnstiles in Use.—Two automatic turnstiles were put into operation at the Sixty-ninth Street Terminal of the Philadelphia Rapid Transit Company, Philadelphia, Pa., on Dec. 14 in order to determine the adaptability of this type of equipment to the Market Street subway-elevated system. Two different types of turnstiles are used. They can be operated by inserting a 7½-cent token and their use is expected to speed up the service materially by expediting the handling of passengers at this location. General use of the new car-fare carriers by elevated passengers, eliminating the necessity of frequent change-making, will work still further to the advantage of the company's patrons because of this new development. One turnstile resembles the turnstile used by the Interborough Rapid Transit Company and the other that in use in the Brooklyn-Manhattan Transit Corporation's stations.

Seeks Amendment of Paving Obligations.—Anticipating renewed efforts at the coming session of the New Jersey Legislature to procure enactment of a law relieving street railways from the obligation to pave parts of streets in which they operate, Secretary Sedley H. Phinney of the State League of Municipalities has sent a communication to the New Jersey Board of Public Utility Commissioners asking that body to present to the Legislature a definite recommendation for modification of paving obligations. Mr. Phinney said that municipalities would be substantial sufferers if such a measure as proposed at the last session were to become a law.

One-Man Cars for Night Service.—One-man cars are planned by the Third Avenue Railway, New York, for its night service on its lines in Manhattan and the Bronx. The extent of the service with this type of equipment remains to be determined.

Wants One-Man Car Service.—The Boise Valley Traction Company, Boise, Idaho, has petitioned the Public Utilities Commission for permission to install one-man cars on the South Boise line. R. B. King, general manager of the railway, stated that unless such economy could be made, which would result in large savings in the cost of operation, the Boise Valley Traction Company would be forced to suspend business. He said further that on the South Boise line in 1920 there was a deficit of $4,255, in 1921 the deficit was $4,560, in 1922 it was $2,850 and in 1923 it was $4,589. For the first four months of the current year the line was running behind $1,088.

Early Morning and Owl Services.—The Grand Rapids Railway, Grand Rapids, Mich., has started an early morning service for the accommodation of factory workers. The service starts at 5:45 a.m. and is so routed as to enable men who formerly had to walk to work to go by street car. The service has been started on one route as an experiment. The plan will be extended to other lines as its success becomes apparent. It is also planned to re-establish owl service.

Ordinance Proposes Bus Lines. — Under an ordinance recently introduced by the City Council the Jacksonville Traction Company will be authorized to operate bus lines through the Riverside section, a portion of Jacksonville, Fla., not being served by street cars. The proposed line in this new territory will be between 4 and 5 miles in length and served by six buses charging a 10-cent fare. If the ordinance is adopted the company will purchase Birney safety type buses.

Paving Dispute Terminated.—The long controversy between the United Traction Company and the city of Albany as to the cost of the pavement of Western Avenue, on which the United Traction Company operates over a privately owned right-of-way, has been settled, it was announced by Mayor William S. Hackett of Albany on Nov. 19. The city of Albany will enter into an agreement with the United Traction Company whereby the latter will be granted a franchise extending over a period of years for the operation of trackless trolleys on Western Avenue, Allen Street, across Central Avenue and over Watervliet Avenue in return for feeing to the city the 33-ft. right-of-way in Western Avenue. Paving the deeded right-of-way will be started next spring, Mayor Hackett announced.

New Bus Lines Opened.—The Central Transportation Company, a subsidiary of the Trenton & Mercer County Transportation Company, Trenton, N. J., has opened up three new bus lines. One is running to Princeton and Kingston, a distance of 14 miles; another to Trenton Junction, 4 miles, and the third along the White Horse Road, 5 miles. The company has placed a luxurious motor coach in service between Trenton and Asbury Park.

"Service" as You Ride—Every two weeks, on Saturday morning, the Indiana Service Company, Fort Wayne, Ind., places in its street cars and distributes to its employees a folder known as "Service." In the premier issue of this paper, under date of Sept. 27, the company announced that it was dedicated "To Your Daily Journey, which we are trying to make safer and more comfortable." The folder is a four-page sheet of convenient size containing some valuable information on city and interurban service and offering a few jokes as entertainment for its readers while they ride. The pamphlet invites criticisms along suggestive lines to bring about a better understanding between the company and its patrons.

Want Employees Protected.—Protection of employees of the Kansas City Railways, Kansas City, Mo., will be sought in the offering of $200 rewards by the receivers for conviction and arrest of reckless drivers. As it stands now, $200 will be paid for arrest and conviction of drivers of motor cars who injure or kill patrons of the railways while they are about to board, are leaving cars or are assembled in safety zones waiting for street cars.

Higher Bus Fees Proposed.—Higher license fees for buses and jitneys are proposed in an ordinance just introduced in the Indianapolis, Ind., City Council in which the maximum charge would be increased from $100 to $250 annually. The ordinance provides that bus companies should not be required to file a bond with the city, but provide insurance policies of $10,000 to $20,000, depending on the size of the bus.

Electric Line Will Supplant Steam Railroad.—The Chicago, Burlington & Quincy Railroad has asked the State Public Utilities Commission for permission to discontinue the operation of passenger trains between LaFayette and Denver. Instead it will operate two trains daily between Louisville and Lyons and then transfer passengers for Denver and intermediate points to the "Kite" Route, the electric railway operating between Denver and Boulder via Louisville. LaFayette is an intermediate point on the steam railroad Denver to Lyons. The suggested change would give the citizens two trains daily between Lyons and Denver, instead of one. The Chicago, Burlington & Quincy Railroad has been operating for years between Denver and Lyons, Colo.

Gives Up Claims Following Payment.—The municipality of Peoria, Ill., has accepted $17,000 in settlement of its paving assessment claims against the defunct Aurora, Plainfield & Joilet Electric line and bondholders' representatives relinquish all claims to the tangible assets within the city's limits. This portion of the plant is to be removed by the city, and it is expected this will settle the involved financial affairs of the defunct traction line. The city has had negotiations with the Northwest Utilities Company of Montana to operate cars over the line, but these were fruitless. Bus lines are expected to be authorized to supplant the suspended lines.

Considering Bus Lines.—The Wisconsin Public Service Corporation, Green Bay, Wis., has under consideration plans for the establishment of bus and motor truck rapid transit lines to radiate out of Green Bay to reach each of the principal cities and villages in northeastern Wisconsin. If carried out, the plan will require an initial investment of between $200,000 and $300,000 for rolling stock, depots and other equipment for this business. Complete data are being collected and examined by the company's transportation experts.

Bus from Lansing to St. Johns.—A permit has been granted the Michigan Electric Railway, Jackson, Mich., to operate a bus line from Lansing to St. Johns over a new paved road connecting the two cities. Application from Wilfred J. Richards to operate a bus line from Lansing to Jackson was refused on the showing of the railway, which contended that its present interurban service between the two points is sufficient to care for the traffic. The railway also sought a bus permit. It contended that if a permit was granted it should receive preference and be allowed to run the buses in connection with its interurbans. The commission decided that traffic was adequately provided for by the railway.

Side Signs in Knoxville.—All cars of the Knoxville Power & Light Company, Knoxville, Tenn., will in the near future be equipped with signs on the sides as well as the front and rear in deference to public requests.

Must Submit One-Man Car Data.—The Public Service Commission, under an order adopted at a session in New York Dec. 15 and served upon the International Railway, Buffalo, will give a hearing at the Buffalo office of the commission on Dec. 29 in the matter of one-man car operation in the city of Buffalo. The commission's order directs the company to submit testimony covering regulations, practices and equipment in respect to the operation of one-man cars; the lines operated as one-man car lines in the city of Buffalo; the number of cars operated and the headway maintained on each line; the number of passengers carried; the number of accidents which have occurred since Jan. 1, 1924, and the cause or causes of such accidents.

Financial and Corporate

New Reorganization Plan

$296,000 Will Be Provided Under the Revised Scheme for Massachusetts Interurban

A new plan, dated July 16, 1924, has been prepared and is being forwarded to security holders of the Boston & Worcester Street Railway and the holding company, the Boston & Worcester Electric Companies. More than 90 per cent of the first mortgage 4½ per cent bonds of the Boston & Worcester Street Railway due Aug. 1, 1923, were deposited under the plan of reorganization formulated when they matured, but it was felt that the bondholders did not make the required response.

In brief, the new plan provides for the exchange of $2,460,000 first 4½s, 1923, and $60,000 Framingham, Southborough & Marlborough Street Railway extended 7s, 1923, for new first mortgage 20-year bonds dated Aug. 1, 1924. Bondholders who subscribe $140 a bond for 10 shares of additional common stock will receive 6 per cent bonds in exchange for their present holdings, non-subscribing bondholders will receive 5 per cent bonds. This subscription right will be subject to the subscription privilege offered preferred shareholders of the Electric companies of subscribing for one share of railway common at $14 for each two shares of Electric companies preferred held. By these subscriptions $296,940 cash will be provided for improvements.

In addition to subscribing for common stock for cash the Electric companies will exchange $47,000 of notes and $60,000 of preferred stock of the railway for common stock of the latter par for par. The banks which hold $115,000 notes of the railway will accept 10-year 6 per cent income bonds. Preferred shareholders of the railway will waive accumulated dividends and exchange their stock for a new issue of 6 per cent preferred stock which will become cumulative upon retirement of the income debentures. Bondholders will receive accrued and unpaid interest on their bonds at 4½ per cent to Aug. 1, 1924.

It is said that upon completion of a study of operating conditions of the property now in progress it is possible that one or more branches may be abandoned, or buses substituted.

Portland, Ore., Will Sell Car Line

The city of Portland, Ore., has announced that on Jan. 15 City Treasurer Adams will sell to the highest bidder the Kings Heights car line, for delinquent assessments and taxes, amounting to $11,669, dating from Dec. 6, 1913. The line is operated by the Portland Electric Power Company as an accommodation to the people of the district, without franchise or title to the property, and is declared to be daily losing money. It is doubtful if the company will want to put in a bid.

The car line was built shortly after the city granted the franchise to the Heights Trust Company on July 28, 1910, to operate until Dec. 31, 1932. The franchise provided that connections be made with the lines of the Portland Electric Power Company and transfers be made over both lines. The Heights line is to pay the city $500 a year as a franchise fee, and the estimated cost of construction of the line at the time of granting the franchise was $20,000. The Heights Trust Company met financial reverses and the Portland Electric Power Company finally took over the operation of the line because many of its patrons of other lines lived on Kings Heights.

Two Chicago Appraisal Engineers Selected

Major R. F. Kelker, Jr., Chicago, an expert in the service of many big cities and formerly in the employ of the city of Chicago, and William J. Hagenah, Chicago, another engineer well known nationally, have been selected as two of the engineers to make a valuation of the surface lines there. Major Kelker was selected by the city and Mr. Hagenah by the bankers acting for the owners. They will jointly select the third member of the board.

Eight-Cent Fare at Denver Upheld by U. S. District Court

Valuation $23,514,769 for Rate Making—Additional Value of $2,000,000 for Perpetual Easements in Streets Excluded from Rate Base—Court Holds "Ordinarily, Reproduction Cost New Less Depreciation Is the Dominant Factor in a Present-Valuation Inquiry"

JUDGE ROBERT E. LEWIS of the District Court of the United States for the District of Colorado on Dec. 13, 1924, handed down a decision in the Denver Tramway valuation and rate of fare case. He fixed the value of the property for rate-making purposes at $23,514,769 and made permanent the present 8-cent cash fare (with 7½-cent ticket fare) and approved the 7½ per cent rate of return allowed by the special master in chancery.

This is the first large street railway to conduct a confiscation case originating in the United States court that necessitated the presentation *de novo* to the court of all details of inventory and valuation with detailed testimony as to the principles of valuation adopted with respect to the basis of reproduction costs, depreciation and the cost of development as measuring the going concern value of electric railway properties. Usually the valuations are fixed by the Public Service Commissions and reach the federal court only on appeal.

The decision disposes of four important items of controversy between the municipalities and the street railway companes and gives judicial interpretation to points that have been

COMPARATIVE VALUATIONS OF DENVER TRAMWAY

Valuation as fixed by decision of United States District Court compared with A. L. Drum & Company valuation as of Dec. 31, 1922, based on unit prices as of Dec. 31, 1922, after deducting items specifically excluded by master and with D. F. Wilcox valuation based on normal reproduction cost for the city of Denver.

	D. F. Wilcox, Normal Reproduction Cost	A. L. Drum & Company, Dec. 31, 1922, Valuation Less Items Excluded by Master	Decision of U. S. District Court
Land and right-of-way (exclusive of water rights)	$428,016	$1,107,024	$992,795
Track	2,906,544	5,347,255	5,121,715
Bridges	478,258	856,231	810,963
Paving	725,632	1,412,005	1,342,524
Electrical distribution system	776,691	1,075,769	1,054,316
Rolling stock	2,365,644	4,445,233	4,198,258
Power station equipment	746,504	1,598,098	1,504,809
Substation equipment	184,015	256,138	249,412
Shop equipment, tools, etc	265,107	391,514	391,514
Buildings	1,520,361	2,510,803	2,356,000
Furniture and fixtures	82,584	174,716	144,918
Total inventoried property	$10,479,356	$19,174,786	$18,167,224
General stores	....	507,599	507,599
Working capital	....	239,394	239,394
Cost of franchise	....	284,100	100,000
Engineering and superintendence	355,605	998,325	970,783
Administration, organization and legal expense	818,569	953,010	839,760
Taxes	54,175	325,220	325,220
Interest	343,554	2,669,165	1,664,889
Total physical property	$12,051,259	$25,151,599	$22,814,869
Accrued depreciation deducted	4,836,031	2,436,915	2,250,000
Physical property less depreciation	$7,215,228	$22,714,684	$20,564,869
Intangibles:			
Cost of financing	....	1,301,455	.....
Water rights	....	290,622	49,900
Going value	....	4,000,000	2,900,000
Total value for rate making	$7,215,228	$28,306,761	$23,514,769
Value of right-of-way on streets under perpetual easement	....	$2,000,000	$2,000,000

seized upon by the representatives of municipalities in order to depreciate and lower the values of traction properties.

The decision clearly establishes:

1. That great weight should be given to reproduction cost at present-day prices.
2. That a fair allowance for general overheads should be made.
3. That accrued depreciation should be deducted only to the extent actually found existing in the physical property, by the inspection of the property.
4. That a definite going value exists in a street railway property and must be included for rate-making purposes.

The decision on these four important items is especially clear. The court said:

> Ordinarily, reproduction cost new less depreciation is the dominant factor in a present-valuation inquiry. S. W. Bell Telep. Co. vs. Pub. Serv. Comm., 262 U. S., 276; Bluefield Co. vs. Pub. Serv. Comm., 262 U. S., 679; Monroe Gas Light & Fuel Co. vs. Mich. Pub. Util. Comm., 292 Fed., 139; Van Wert Gas Light Co. vs. Pub. Util. Comm., 299 Fed., 670.
>
> Accrued depreciation is a fact to be ascertained by inspection.
>
> There remains to be added an amount for going concern value. . . . I am firmly of the notion that each of these witnesses knew much more than I do about what it would probably cost to put a skeleton street railway plant in successful operation. I am sure they each knew a great deal and I see no escape from accepting the lowest amount named in the testimony, $2,900,000, which, added, brings the valuation of the plant to $23,514,769.

ALLOWANCE FOR PERPETUAL EASEMENT

The court allowed additional value of $2,000,000 for perpetual easements or right-of-way in the streets under the Denver franchises of 1885 and 1888 as being property value. It stated:

> No one doubts that the easements, whatever their duration or terms may be, are property, and property of value, and that they inhere in and are indispensable to the other property rights of the company. They lie in grants and are the foundation of all other rights. They are of such import, both to the company and the public, that, having been put in issue, I think their duration and value should be now adjudicated, though it be finally held, as the master held, that their value cannot be brought into the rate base. . . .
>
> The terms used in both ordinances, 1885 and 1888, are appropriate to grants in perpetuity. There are no express limitations and no language is used from which an implication can arise that a less estate was intended than the general terms signify. The nature of the transaction, its purposes, its permanent character, and the investment required of the grantees repel an intention by either grantor or grantee that they were revocable licenses or easements at the will of the grantor, nor can any expression be found in either ordinance supporting a claim that the rights granted were to be for a term of years.

This comment has been interpreted to mean that in the event of condemnation for purchase of the property the company would be entitled to an allowance of $2,000,000 for the perpetual easements on the streets of Denver. The court, however, excluded this amount from the value for rate-making purposes.

The court sets forth at length in the decision the respective qualifications and practical experiences of Delos F. Wilcox, appraiser for the city of Denver, and A. L. Drum, valuation engineer for the Denver Tramway, stating as follows:

> I think it clear beyond question that there was a total failure to qualify this witness (Delos F. Wilcox) as an expert and that it was error in matter of law to permit him to testify as an expert.

A tabulation published herewith gives by classified items a comparison of the values of the property as found by the court, A. L. Drum, representing the Denver Tramway, and Delos F. Wilcox, representing the city of Denver.

It will be recalled that Judge Dubbs as special master fixed the value of the property at $20,105,707. His findings in the case were reviewed at length in the issue of the ELECTRIC RAILWAY JOURNAL for Sept. 13, page 406. In his review of the case the special master said that the burden of proof was on the company.

Ohio Traction Company Stock Active

A rise of ten points in the preferred stock of the Ohio Traction Company, Cincinnati, Ohio, has taken place during the last three weeks. This activity is attributed to heavy purchases by Eastern capitalists. The Ohio Traction Company owns and controls the stock of the Cincinnati Traction Company, which operates the system under lease from the Cincinnati Street Railway. The company pays a dividend of 5 per cent. The heavy buying of the stock is attributed to the fact that the Ohio Traction Company has wiped out its indebtedness and now is in a position to resume the payment of dividends, which were discontinued in November, 1915. At that time the preferred was quoted at 55 on the Cincinnati Stock Exchange. Such well known New York brokerage firms as W. H. Harriman & Company have been buyers.

It was stated that if the traction interests and the city of Cincinnati were unable to reach an agreement over a new franchise, the Ohio Traction Company was willing to pay back franchise taxes from the time it started to raise fares above the level of 7½ cents. This would amount to $437,500, which would include the year of 1924 and the last quarter of 1923. In the event that the city is unable to effect an agreement with the traction interests before the advent of 1925 it is possible that the traction company will make a proposition to the city which will embody the payment of the back franchise tax and the keeping of fares at their present level, 10 cents. On the other hand, should the city take the matter into the courts this would involve long litigation, permitting the traction company to control the system for an indefinite period. At the present rate of fare the traction company would accumulate a surplus in the course of time, which would react to the benefit of the car rider.

New Personnel for Oklahoma Property

Officers of Albert Emanuel & Company, New York, N. Y., have been elected to the Pittsburg County Railway, McAlester, Okla., following the purchase some time ago of that property by the Emanuel interests. At the same time that the railway was taken over the Emanuel people took over the Choctaw Power & Light Company. These two properties are now included in the holdings of the Southwestern Power Company, which operates in the Oklahoma district. The new officers are as follows: President, Albert Emanuel; vice-president, Victor Emanuel; vice-president, general manager and head of purchasing department, G. W. Skow; secretary, Floyd H. Harper; treasurer, C. B. Zeigler; assistant treasurer, F. R. Merris; superintendent of railway, J. M. Putnam; district superintendent, H. B. Harris; chief engineer, H. T. Asbury; head of traffic department, A. R. Goodner, and chief engineer of the power plant, M. P. York.

The new owners of the property have proceeded with the work of rehabilitating the Pittsburg County Railway and have carried out important replacements and reconstruction. The road is in a territory that affords considerable freight and is said to be doing very well from the standpoint of the freight earnings. The line is 26 miles long.

Chicago Probably Leads Country in Riders per Capita

Detailed figures on car riding habit in the leading cities of the United States compiled by the Chicago Surface Lines place New York, Chicago and Philadelphia in the lead in that order on a basis of actual passengers carried. An explanation states that a division of the New York revenue passenger figures, if available, would reveal that many of the fares paid represent a duplication of the same person changing from one line to another where there is no transfer privilege.

The figures stand as follows:

No. of Rides per Capita Daily:	
New York	1.21
Chicago	1.03
Philadelphia	0.89

The Chicago figure is based on the United States census population of 2 936,605 and the following monthly revenue passengers:

Surface lines	70,543,501
Elevated	18,154,400
Motor coach	5,029,875
Total	93,727,776
Daily average revenue rides	3,023,476
Excess of rides per day over population	83,871

For New York, the revenue rides of the last calendar year, 2,623,793,713, were divided into a daily average of 7,188,475 as against a population of 5,927,625, showing an excess of rides over population of 1,260,850.

In Philadelphia the revenue rides, exclusive of 3-cent transfers, zone fares and joint rate passengers, was placed at 53,870,920 for October, a daily average of 1,737,771. The population, 1,951,076, used as a divisor, shows 0.89 of a ride per day per capita, or 213,305 fewer rides daily than population. In these figures, 160,000 population outside the city was included. The number of passengers was arrived at by subtracting 56,420,521 3-cent transfers. By counting in 3-cent transfers as separate revenue passengers, Philadelphia is placed in the lead in the "riding habit."

The figures were based on research directed by J. V. Sullivan, assistant to the vice-president of the Chicago Surface Lines. They are sponsored by Guy A. Richardson, vice-president and general manager of the Chicago Surface Lines.

$2,700,000 of P.R.T. Equipment Trust Certificates Offered

Dillon, Read & Company, New York, offered for subscription on Dec. 16 $2,700,000 of 5½ per cent equipment trust certificates of the Philadelphia Rapid Transit Company. The certificates mature serially from 1925 to 1934 and were priced to yield approximately 4.75 per cent to 5.50 per cent according to maturity.

The bankers explain that the certificates are to be issued by the trustee in part payment for new equipment consisting of 100 standard double-truck vestibuled cars, 125 double-deck motor coaches, 77 single-deck motor coaches and 11 motorized service units. This equipment will be constructed at a total cost of not less than $3,772,000. The par value of the certificates represent approximately 75 per cent of the cash cost of the railway cars and less than 70 per cent of the cash cost of the motor vehicles.

Raleigh Company Reorganized

The Carolina Power & Light Company, Raleigh, N. C., recently acquired by the J. G. White Company, has been reorganized. The following officers were elected: P. F. Henderson, president; W. W. Muckenfuss, secretary; M. H. Hendee, treasurer, and Harry Sudlow, manager. The board of directors is composed of P. F. Henderson, W. W. Muckenfuss and Charles J. Hill of Aiken, and George T. Jackson and F. B. Culley of North Augusta.

Toronto Purchase Price Finally Settled

Final settlement has been reached between the city of Toronto and the Toronto Street Railway regarding the purchase of the latter's properties by the municipality. The cost to the city is $13,679,242. The award of arbitrators, as finally settled by the Privy Council, was $11,483,500. Interest on this is $1,550,000 and legal charges $700,000.

$7,000,000 North Shore Issue Offered for Subscription

First and refunding mortgage bonds of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., to the amount of $7,000,000 were offered for public subscription on the morning of Dec. 19. The offering syndicate was headed by Halsey Stuart & Company, Inc., and the National City Company, New York. The bonds are dated Jan. 2, 1925, and are due Jan. 1, 1955. They carry 6 per cent interest and were offered at 98 and interest to yield 6.15 per cent. The present issue is known as series A. It is explained that the proceeds from the sale of the bonds will be used to refund $3,500,000 of one-year notes due June 15, 1925, issued in connection with the construction of the first section of the road to Waukegan, for the retirement of $2,721,700 additional principal amount of the company's refunded obligations, and for other corporate purposes. In the letter of the railway to the bankers giving the facts with respect to the purchase of the bonds by them the point is emphasized that the railway won the Coffin prize in 1923 awarded for its distinguished contribution to the electric railway industry. The bankers, in turn, call the attention of the investing public to this fact.

Auction Sales in New York.—At the public auction rooms of A. H. Muller & Sons there were sold this week 100 shares of Helena Light & Railway Company, Helena, Mont., preferred, $10 per share, and 20 shares of preferred, $15 a share. Also 250 shares Third Avenue Railroad, New York, $14 a share.

Approves Issue for Refinancing.—The Public Utilities Commission has approved the application of the Washington Railway & Electric Company, Washington, D. C., to issue $1,850,000 of its general and refunding mortgage 6 per cent 10-year gold bonds made a short time ago. The issue is for the purpose of refinancing the utility's obligations, specifically a loan of $1,850,000 of Metropolitan Railroad Company first mortgage 5s which mature on Feb. 1.

Bonds Offered—A syndicate including E. H. Rollins & Sons is offering at 97 and accrued interest to yield more than 5.70 per cent $5,000,000 of the first and refunding mortgage 5½ per cent gold bonds of the Illinois Power & Light Corporation, Chicago, Ill. The bonds, known as series "B," are dated Dec. 1, 1924, and are due Dec. 1, 1954. The proceeds will be used to reimburse the treasury in part for expenditures on account of additions, extensions and improvements which have been made or are to be made to the properties and for the retirement of $157,500 underlying bonds.

Debenture Bonds Offered.—Bodell & Company, Providence, R. I., are offering at 91 and interest, yielding 6.70 per cent, $2,500,000 of the 30-year debenture gold bonds of the Federal Light & Traction Company, New York, N. Y. The bonds, known as Series "B," are dated Dec. 1, 1924, and are due Dec. 1, 1954. The proceeds of these debenture bonds will be used to retire any outstanding unconverted series "A" 7 per cent debentures which will be called for payment on March 1, 1925, and for extensions and improvements made or to be made to the properties of the operated companies.

Urged to Deposit Bonds.—The committee for the holders of first mortgage 6 per cent 10-year gold bonds of the Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan., has announced that the time for the deposit of the bonds expires Jan. 10 next. The bonds became due Aug. 1, 1924. There is now on deposit a majority of the bonds.

Asks Revaluation.—When the petition for an increase in rates on the line of the Richmond & Petersburg Interurban Railway came up before the State Corporation Commission, on Dec. 3, counsel for the citizens who are opposing the Virginia Railway & Power Company's application insisted on a revaluation of the interurban line. The commission heard the motion to revalue the property and gave both parties ten days in which to file briefs. The present fare from Richmond to Petersburg is 47 cents and the fare sought is 60 cents.

Shareholders Made Offer.—A committee has been formed for the purpose of arranging a sale of the preferred and common shares of the New Hampshire Electric Railways, Haverhill, Mass., and has received an offer of $32 per share for the preferred shares and $3 per share for the common shares. The offer has been accepted by the owners of upward of 50 per cent of each class of shares and the committee recommends the acceptance of the offer by all shareholders. The shareholders desirous of accepting the offer must deposit their shares on or before Jan. 5, 1925.

May Abandon Cars.—Manager Harding of the Columbus Electric & Power Company, Columbus, Ga., submitted a statement at a recent meeting of the directors of the Chamber of Commerce and asked for a public hearing on his plan to abandon the railway line which runs through Wynnton as far as Wildwood Park. His idea calls for the substitution of a bus route under the management of the Columbus Transportation Company. He believes that this operation will be more economical than extending existing railway lines.

Cars Cease to Operate in Oldest City.—The St. John's Electric Company has abandoned service in the city of St. Augustine, Fla., but will continue to operate the line to Anastasia, the company planning to commence on the work of rebuilding its line to St. Augustine Beach within a short time. The company has been operating at a loss for some time now, but an agreement could not be reached until the company said it would rebuild the line to the beach and assume certain obligations with regard to street improvements. The ordinance was published about a month ago and no restraining order being filed the company began the work of dismantling.

Gross and Net Earnings Decrease.—The revenue of the Barcelona Traction, Light & Power Company, Barcelona, Spain, for the year ended Dec. 31, 1923, was $2,726,973, according to the ninth annual report recently submitted to the board of directors. The administration and general expenses were $154,476. There was a balance of revenue available for interest on first mortgage bonds of $1,123,511. The balance carried to the balance sheet for the year was $21,985. In the report to the shareholders E. R. Peacock. president, said that the operating results of the tramway showed a decrease in gross earnings of 1.3 per cent and in net earnings of 7.8 per cent compared with the previous year.

Property Sold.—The Sheffield Company sold its electric railway at Sheffield, Ala., on Dec. 8 to the Alabama Power Company. The consideration was not announced, but was said to be about $3,000,000. The property will be taken over by the Alabama Power Company directly. The Sheffield Company owned and operated the interurban railway, which served Sheffield, Florence and Tuscumbia. It also owned the power plant which distributes light and power, and the water plant which supplies Sheffield and Tuscumbia.

Personal Items

Mr. Langan Advanced in Westinghouse Service

T. R. Langan, recently appointed manager of the transportation division in the New York office of the Westinghouse Electric & Manufacturing Company, formerly was manager of the transportation section in the Buffalo (New York) district with headquarters at Syracuse. In New York Mr. Langan succeeds A. J. Manson, recently promoted to the position of manager of the heavy traction division of the railway sales department at East Pittsburgh.

After taking courses at Pratt Institute, Brooklyn, and while taking night courses at Carnegie Institute of Technology, Pittsburgh, Mr. Langan entered the employ of the Westinghouse Company in 1904 as an armature winder's helper and wireman's helper in the service department. His work from 1904 to 1906 was in connection with the earlier installation of multiple-unit control equipments on the Brooklyn Elevated and New York subway. In 1906 he began the special apprenticeship course at the East Pittsburgh Works.

In 1908 Mr. Langan took up construction work in the service department. Later in that same year he was made assistant general foreman of maintenance on the electric division of the New York, New Haven & Hartford Railroad with headquarters at Stamford, Conn. In 1910 he was back again at East Pittsburgh on special service and engineering work in connection with the development of the present line of Westinghouse HL control and railway apparatus.

Mr. Langan entered the sales department in 1913 and began his selling career at Baltimore. He won success and recognition at once. From Baltimore he went to Philadelphia, then to Buffalo and later to Syracuse. His present move to New York places Mr. Langan in charge of the largest district office transportation division of the Westinghouse Company.

F. C. Pratt a Vice-President of General Electric

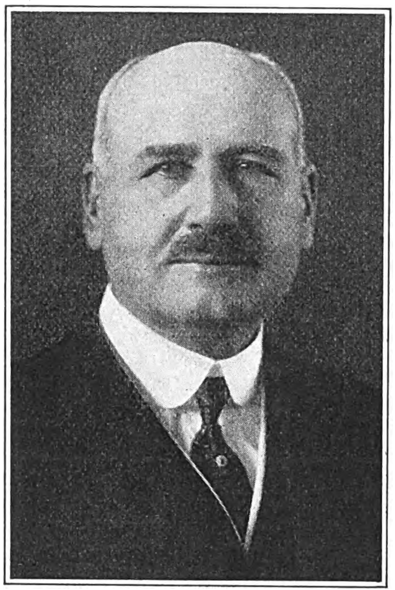
Francis C. Pratt, vice-president in charge of engineering of the General Electric Company, has been appointed to fill the vacancy caused by the resignation of G. E. Emmons as vice-president in charge of manufacturing and chairman of the manufacturing committee. Mr. Pratt's new title will be vice-president in charge of engineering and manufacturing.

In 1890 Mr. Pratt entered the plant of the Pratt & Whitney Company at Hartford, of which concern his father was president. He advanced to the vice-presidency and, in 1906, left to become associated with the General Electric Company as assistant to E. W. Rice, Jr. In 1912 he was appointed assistant to the president and in 1919 was elevated to the vice-presidency in charge of engineering. He was born in Hartford, Conn., Jan. 19, 1867. He was graduated with the degree of Ph.B. from the Sheffield Scientific School, Yale University, in 1888.

J. E. Hutcheson Honored

Montreal Tramways Manager Receives Recognition for Long and Able Service

Lieut.-Col. J. E. Hutcheson, recently elected vice-president of the Montreal Tramways, Montreal, Que., in addition to general manager, has been connected with that property since 1912. The new honors that thus have come to him are well merited. Colonel Hutcheson is a man of unusual ability and he has made a remarkable record in his handling of the operation of the tramway company. There have been several changes in the financial control of the tramway during the colonel's term of service with the property, but there has never been any question about his outstanding fitness for the post of manager, and now acknowledgment of his attainments in handling the property has come in his recent advancement to the vice-presidency of the company.



J. E. Hutcheson

Not the least of the achievements during his service as manager was the adoption of the service-at-cost plan. Some day, no doubt, the history of the negotiation of that agreement will be fully set forth, and it is unthinkable that Colonel Hutcheson's name will not be found written large in that work for the direct and indirect part which he took in helping to accomplish the passage of this measure. The terms of this contract are administered by a commission of three members, with whom the colonel has worked in close contact and with harmony. A measure of the success of the company under Colonel Hutcheson's direction is fortunately furnished by a recent offering of bonds of the company on a 5.45 per cent basis, in which it is divulged that the net earnings are more than 3⅓ times the annual bond interest charges. The colonel has also been in demand on numerous occasions to act in an advisory capacity in connection with the determination of railway and utility problems elsewhere.

Colonel Hutcheson entered the steam railway field in 1878 as a telegraph operator on the Grand Trunk Railway. In 1884 he joined the Canadian Pacific Railway as train dispatcher, and later became trainmaster and divisional superintendent. He left the service of the Canadian Pacific Railway in 1891 to take charge of the construction and later the management of the Ottawa Electric Railway. He remained in the service of that company until August, 1912, when he resigned to go to Montreal as general manager of the Montreal Tramways.

The colonel has had many years of service in the Canadian Militia, and for several years prior and during the great war served as a member of the committee on small arm development and manufacture in the Department of Militia and Defense. Despite his responsibilities he has not forgotten how to play. He is still very much the boy. He has always taken keen interest in military rifle shooting and was one of the leading rifle shots of the Dominion. He was a member of the Canadian Rifle Team which was sent to compete at Bisley, England, on several occasions and was adjutant and coach of the Canadian team in 1910. He was also a captain and coach of the Canadian Rifle Team that competed against teams from Great Britain, Australia and the United States for the Palma trophy in Ottawa in 1911.

Owen Young Suggested for Mayor of New York

Under the caption, "Another Job for You, Mr. Young," newspapers in New York City controlled by Frank Munsey carried on their front pages on Dec. 18 a summons to Owen D. Young, colleague of Brig.-Gen. Charles G. Dawes on the Dawes committee and later Agent-General of Reparation Payments, to permit himself to be drafted as a candidate for Mayor in next year's election. Mr. Munsey said that New York City, now grown so big, is an empire in itself and that it needed Mr. Young to reorganize it, quite as Europe needed him and General Dawes. Mr. Munsey said that Mr. Owen's part in the Dawes Plan and later as Agent-General of Reparations Payments gave the world an example of keen vision.

G. F. McKay has been elected secretary of the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md. He succeeds Thomas Mason, who also served as assistant to the president. J. A. Mellor has succeeded E. E. Polglase as master mechanic. E. A. Gannon is passenger agent and I. E. Ballard freight agent.

H. A. Johnson on Important New Work

Former President American Electric Railway Engineering Association Selected by Steam Railroads to Direct Exhaustive Investigation of Power Brakes

HARLEY A. JOHNSON, assistant to the general manager of the Chicago Rapid Transit Company and superintendent of shops and equipment of the Chicago, North Shore & Milwaukee Railroad, was appointed director of research of the American Railway Association, effective on Dec. 1, to take full charge of an extensive investigation of power brakes for both passenger and freight trains. Announcement of the appointment was made on Dec. 18. His selection to fill this very responsible post is a marked tribute to Mr. Johnson's ability and integrity as an engineer, and reflects credit on the electric railway industry as a whole and on the companies with which he has been associated continuously since graduation from Purdue University as a mechanical engineer in 1905. Credit to the Rapid Transit and the North Shore companies is further reflected by an agreement between the A.R.A. and President Britton I. Budd, under which Mr. Johnson will continue in his present capacity with those companies while at the same time directing this new work for the A.R.A.

WILL DIRECT RESEARCH

This appointment of a director of research for the A.R.A. is the outgrowth of a report by the Interstate Commerce Commission pointing out the necessity for improvement in power brakes for passenger and freight trains, and laying down certain requirements that should be met by such brake systems in the interests of public safety. The A.R.A. was directed by the commission to prepare tentative specifications for brake equipment which would fulfill these requirements, and be suitable as the basis for negotiations leading to the formation of approved specifications and a formal order covering their adoption.

This decision in favor of undertaking a thorough investigation of the entire subject of power brakes followed a finding by the A.R.A. to the effect that the general principles of satisfactory brake operation adopted by the commission were at variance with what the railroads after their exhaustive investigations and extensive experience had thought safe and desirable. As a result the committee on safety appliances felt a grave responsibility involved in any recommendations which might be made. It thereupon cast about for a man to head this extremely important work. In the words of R. M. Aishton, president A.R.A., the following is an outline of the scope of the task to be undertaken:

> The appointment of a director of research required the retention of a man who would be a competent and practical engineer, of unquestioned ability and integrity, without railroad or manufacturing affliation. The director will be empowered and authorized to take any action he deems necessary to enable him unqualifiedly to concur in the results of the tests, investigation and conclusions reached, such as surrounding himself if he so desires, with a staff of his own selection, sufficiently large and sufficiently competent to arrange for tests and so conduct them that every opportunity for criticism may be eliminated as to the decision having been influenced in any degree by railroads, manufacturers, patentees, or from any other source.
>
> The exisitng machinery of the Mechanical Division, American Railway Association (Safety Appliance Committee), will be prepared to act as an advisory committee to the director of research, if he so desires, and will arrange for the services of other existing committees, or the appointment of additional committees of the association as may be considered desirable by the director of research.
>
> The suggested scope of the work will include: investigation into the desirability and practicability of all designs and suggestions of possible merit in connecton with brake operation, giving special consideration to safety of operation through the incorporation of the apparatus so tested, of such functions as may be in existence or be suggested, that in the judgment of the director are worthy of consideration. This may, and probably will, necessitate the installation of a plant to test devices and functions under all possible conditions of service, in addition to technical tests, or may necessitate establishing on a single railroad, temporary service of a special character to enable the director to reach conclusions as to the effect on moving trains of any functio nsuggested that he desires to consider.

H. A. Johnson

In proposing Mr. Johnson to head this work, Mr. Aishton made the following statement:

> I don't know of anybody in the United States who is better fitted than Mr. Johnson to do a thorough job in a fearless way, from both a technical and practical standpoint, or who would so thoroughly cover every phase of the situation. His standing in the engineering and commercial field is beyond any question.

Mr. Johnson obtained some of his early experience in the steam road field. Previous to his graduation from Purdue University, he was employed at various times as draftsman, locomotive fireman, laboratory assistant and helper in the locomotive erecting shop of the Chicago, Burlington & Quincy Railroad. He entered the employ of the Metropolitan West Side Elevated Railway on Aug. 26, 1905, and has been with this company and its affiliated successor companies to the present time. He started at the bottom, as a helper in the repair shops on the maintenance of car equipment. He went into the drafting room in November, 1905, to engage in work on car design, traffic studies and maintenance of way. In April, 1907, he was made engineer of car equipment, and in December of the following year was promoted to master mechanic of the Metropolitan West Side Elevated Railway. When the four elevated roads in Chicago were placed under one operating management in 1911, his duties were extended to include these four roads. In 1915 his title was changed to superintendent of shops and equipment and in July, 1916, he was also appointed superintendent of shops and equipment on the Chicago, North Shore & Milwaukee Railroad, which was awarded the first Coffin prize during the year 1923.

Mr. Johnson was made organization engineer on the Chicago Elevated Railroads in March, 1920, and remained superintendent of shops and equipment of the Chicago, North Shore & Milwaukee Railroad. During this time he analyzed operating methods, costs, etc., and prepared statistical information which was used as the basis of recommendations for improvement of methods, practices or processes in all departments. Again inherent ability and unusual personality resulted in rapid promotion. In December, 1921, he was made assistant to the general manager of the Chicago Elevated Railroads, but remained superintendent of shops and equipment of the Chicago, North Shore & Milwaukee Railroad. In this capacity he continued to be responsible for the design and construction of all new rolling stock.

AN ANALYST OF GREAT ABILITY

Mr. Johnson's keen mind and breadth of vision were recognized by the companies with which he was associated, and he was repeatedly called upon to make extended investigations of other proprties for the purpose of bringing to the Rapid Transit Lines ideas for improvements in service suggested by the practices of others. In 1920 he accompanied the local transportation committee of the City Council of Chicago on a trip of inspection of the transportation facilities in a number of large cities in the country. In 1921 he was vice-chairman of a committee appointed by Samuel Insull to study the electrification of steam railroads in the United States and in this capacity traveled over approximately 95 per cent of the electrified steam railroad mileage in the country. In 1922 he was chairman of a committee of operating officials of the Chicago, North Shore & Milwaukee Railroad who visited the Pacific Coast and Texas cities to get ideas for improvements in service.

While president of the American Electric Railway Engineering Association, he, James W. Welsh, executive secretary of the association, and Harry L. Brown, editor ELECTRIC RAILWAY JOURNAL, were appointed as a special committee on foreign operations to investigate local transportation in England, Scotland, France and Switzerland. This committee submitted an extended report at the last convention, which was published in full in the ELECTRIC RAILWAY JOURNAL of Sept. 20, 1924.

Mr. Johnson is a member of the American Institute of Electrical Engineers, the Society of Automotive Engineers, Western Society of Engineers, American Electric Railway Association and the Western Railway Club.

Chicago "L" Orders 100 More De Luxe Cars

Comfort Features Embodied in an Earlier Group of Cars Have Been Retained in New Vehicles

To give additional service on the elevated lines, 100 new cars have been ordered this month by the Chicago Rapid Transit Company. In their design and equipment these cars will be similar to the group placed in service last winter and described in detail in the Jan. 12, 1924, issue of ELECTRIC RAILWAY JOURNAL. They will duplicate all of the de luxe features incorporated in the former cars, which have proved very popular with the riding public. A marked preference for this type of car has been noticeable on the part of passengers boarding the trains. The use of spring upholstered plush seats is considered to be an important factor in this popularity and will therefore be duplicated in the new cars. These will be built by the Cincinnati Car Company.

Interior trim, seating arrangements and heating devices will be the same as on the first group. With a view to making the cars as warm and soundproof as possible, the practice of using double wood floors is repeated. A ½-in. layer of compressed hair insulating material is laid between the steel underframe and the lower wood floor. On the previous group of cars this construction proved to be satisfactory from the standpoint of insulating the interior of the car from noise. Sound-insulating material is used also inside the side plates and above the headlining.

SUITABLE FOR SUBWAY OPERATION

In the design of all cars built for this company since 1914, the possibility of future subway operation has been borne in mind. When this group of 100 cars are delivered there will be a total of 455 steel cars suitable for subway operation. The details of the steel framing are very similar to the previous group and provision has again been made to allow a center door to be put in if desired. Four sliding doors, two in each end vestibule, are operated by National Pneumatic electro-pneumatic equipment, similar in design and construction to the type used before. The door control is arranged so that a guard between the two cars may control the adjacent doors in each car, or may take control of all four doors on each car, permitting a train to be operated with one guard for each two cars.

In accordance with previous practice, each car will be equipped with one motor truck and one trail truck, with two motors on the former. Trucks will be of Baldwin equalizing bar type. The motor trucks are equipped with 34-in. rolled steel wheels and the trailer trucks with 31-in. wheels. Motor and control equipment has not yet been decided upon.

The new cars will weigh approximately 75,000 lb. complete. This will be divided so that the car body with control equipment will weigh approximately 43,700 lb. and the trucks and motors will run 31,300 lb. Specifications are given in the accompanying table.

Number of cars ordered	100
Name of road	Chicago Rapid Transit Co.
Date of order	About Dec. 1
Date of delivery	Starting July 1, 1925
Builder of car body	Cincinnati Car Co.
Type of car	Elevated, passenger
Seating capacity	52
Weight	
Car body with control equipment	43,700 lb.
Trucks Equipment	31,300 lb.
Total	75,000 lb.
Bolster centers, length	33 ft. 8 in.
Length over all	48 ft. 0 in.
Truck wheelbase	
Motor	6 ft. 6 in.
Trailer	5 ft. 6 in.
Width over all	8 ft. 10$\frac{7}{16}$ in.
Height, rail to trolley base	12 ft. 3 in.
Body	Steel
Interior trim	Mahogany
Headlining	Steel
Roof	Arch
Air brakes	Westinghouse AMU
Armature bearings	Plain
Axles	Heat-treated, Standard steel
Bumpers	Hedley anti-climbers
Car signal system	Conductor's hand bell
Car trimmings	Statuary bronze
Center and side bearings,	Stucki side, railway standard center
Conduits and junction boxes	Metallic
Couplers,	Automatic, Van Dorn and Stern & Ward
Curtain material	Double-faced Pantasote
Destination signs	Hunter
Door operating mechanism,	National Pneumatic electro-pneumatic
Hand brakes,	Blackhall handle and Peacock mechanism
Headlights	Crouse-Hinds portable
Journal boxes	Symington
Motors	Inside hung
Paint and varnish	Chicago Varnish
Seating material	Plush
Slack adjuster	Westinghouse Type J
Springs	Standard Steel Works
Trolley retrievers	Keystone
Trolley base	U. S.-13 F
Trucks	Baldwin equalizer
Ventilators	Railway Utility
Wheels	Rolled steel, 31 in. and 34 in.
Special devices, etc.	Rico coasting recorders, Rico No. 5 "Steelkar" straps

Extensive Program for 1925

The Grand Rapids Railway, Grand Rapids, Mich., is planning to spend nearly $750,000 on maintenance of way and new equipment in 1925. Approximately 11,179 ft. of double track will be reconstructed. This, together with the installation of considerable special trackwork, two railroad crossings and various other jobs, will cost $298,557.

Additional rolling stock which it is proposed to buy consists of 30 lightweight, double-truck cars to cost approximately $12,000 each and eight Fifth Avenue type J buses at approximately $7,000 each. Among the accessories included in the 1925 program are 50 Wood fare boxes, 27 Kuhlman type E slack adjusters and 11 U type automatic slack adjusters for Birney cars.

A portable Ingersoll-Rand air compressor will be purchased for the way department and also a steam-driven concrete mixer. For use as an emergency truck it is planned to buy a 3-ton truck chassis. Shop facilities will be improved by the installation of a thermostatically controlled babbitt pot, an oven for babbitting and a number of compressed air hoists.

Brill Gets Big Car Order

An order was placed this week with the J. G. Brill Company for 100 new cars for the Philadelphia Rapid Transit Company, Philadelphia, Pa. These will be of the single-end, front-entrance, center-exit type similar to the 385 cars ordered Jan. 22, 1923, and described in the ELECTRIC RAILWAY JOURNAL for March 10, 1923. One respect in which the new cars will differ from the first order is that they will be 3 in. longer, the added length being in front of the exit door. Delivery will commence in April, 1925. The cost of the cars will be in the neighborhood of $1,200,000, which, with the buses recently ordered by this company, will involve a total expenditure of nearly $4,000,000 for new rolling stock.

Uniformity of Details with Existing Motors Desired in New Designs

We hear so much of the advantages of new equipment that we are liable to assume that there are no disadvantages. One of the chief criticisms heard of new designs is in regard to the lack of interchangeability of parts with those of existing equipment. A recent order for car equipments specified a type of motor brought out 15 years ago. Inquiry as to the reason for this choice brought out the fact that this railway had but one type of motor, although it was operating 600 motor cars. The officials of this road considered that the advantages of uniformity outweighed improvements in design.

The large parts of railway motors such as frames and housings are seldom replaced and interchangeability

Metal, Coal and Material Prices

Metals—New York	Dec. 16, 1924
Copper, electrolytic, cents per lb	14.625
Copper wire base, cents per lb	16.875
Lead, cents per lb	9.30
Zinc, cents per lb	7.75
Tin, Straits, cents per lb	55.75
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.125
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	1.875
Franklin, Ill., screenings, Chicago, net tons	1.625
Central, Ill., screenings, Chicago, net tons	1.675
Kansas screenings, Kansas City, net tons	2.35
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.75
Weatherproof wire base, N.Y., cents per lb.	18.00
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.16
White lead in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.157
Turpentine (bbl. lots), N. Y., per gal.	0.84

with existing equipment is not a particular advantage. But repair parts such as armature coils, commutators, brushes, brush holders, field coils, bearings, gears and pinions must be kept on hand in considerable quantities for replacements and any reduction in the number of types that must be carried in stock is a great help to the railway. Several railways have rehabilitated their motors so as to reduce the number of bearings that must be kept on hand, others have made wholesale changes in gear ratio so as to provide uniform gearing. These are things that could have been incorporated in the original design without decreasing the number of new and valuable features.

There are also a number of things that may be considered as auxiliaries to the motors that are affected by motor design. Some of these are motor suspensions, connectors for motor leads, lengths of motor leads and the position on the motor where they are brought out. Uniform arrangement of these details by the motor manufacturers will do much to reduce the number of parts that must be carried in stock and also repairs. Railway officials are anxious to have improved equipment, but there is a strong feeling among the men responsible for maintenance that much can be done toward securing greater uniformity of detail parts.

Rolling Stock

Black River Traction Company, Watertown, N. Y., is remodeling its old two-man cars into one-man pay-as-you-enter type for use in Watertown, Brownville and Dexter.

Detroit United Railway, Detroit, Mich., has ordered 100 buses instead of 75 as was at first planned. Ten of these single-deck buses have been loaned to the Wolverine Company for service between Detroit and Mount Clemens to replace antiquated equipment, and some of the first new buses to arrive are now on the Wyandotte-Trenton division. Buses and interurbans are being alternated as far as Farmington on that line.

San Antonio Public Service Company, San Antonio, Tex., has placed an order for two more Reo model W pay-enter buses having a seating capacity for 21 passengers each.

Track and Line

Tri-City Railway, Davenport, Iowa, is spending approximately $15,000 to reconstruct and lay new brick paving between its tracks on Second Avenue from Fifteenth Street to Seventeenth Street, according to an estimate made by T. C. Roderick, general manager.

East St. Louis, Caseyville & Eastern Railroad, East St. Louis, Ill., has been granted a franchise by the St. Clair, Ill., Board of Supervisors for an electric line between Caseyville, Ill., and Washington Park, a suburb of East St. Louis. A clause provides that construction must start within one year. This is a new incorporation referred to in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 18, 1924.

Harrisburg Railways, Harrisburg, Pa., has completed its program of track reconstruction for this year. This included the rebuilding of between 4 and 5 miles of single track at a cost of approximately $250,000. In general A. E. R. E. A. standard 7-in. grooved girder rail was used with bolted joints seam welded. On most of this work International twin steel ties were installed.

Chicago Surface Lines, Chicago, Ill., has extended the Belmont Avenue line from Cicero Avenue to Central Avenue.

Reading Transit & Light Company, Reading, Pa., in co-operation with the City Council and people of the northeast section has opened up a 3-mile electric railway known as the northeast loop to serve the residential section of the northeast. The line, constructed in four months, was built by the people of the territory which it serves. The company will operate the line under a 999-year lease.

Pittsburgh Railways, Pittsburgh, Pa., is laying new tracks and switches at Fifth Avenue, Grant and Diamond Streets in preparation for the short-looping of cars if the plan is given a trial.

Springfield Street Railway, Springfield, Mass., has expended about $40,000 in new track installations and other improvements at Elm Street and Park Avenue, West Springfield, preparatory to the opening of the new North End bridge across the Connecticut River. The company has also expended $15,000 on replacements and improvements at the intersection of Main and Lyman Streets in Springfield, near the site of the new Union Station.

Shops and Buildings

Philadelphia Rapid Transit Company, Philadelphia, Pa., has completed its carhouse on the block bounded by Twentieth, Johnson and Nineteenth Streets and Moyamensing Avenue. The finished terminal, which is modern in every respect, came within the estimated cost of $1,500,000. It has a capacity of 450 cars.

Birmingham Electric Company, Birmingham, Ala., will abandon the East Lake carhouse in a short time under a plan to centralize all existing railway repairs and storage operations in its Third Avenue carhouse. The reason for this movement is to increase the efficiency of the company, allowing the organization to maintain a smaller number of men in its shops department. Need of improvements at the East Lake carhouse and the paving of First Avenue are also factors in the move. J. S. Pevear, general manager, estimates that to equip the old carhouse would require an extra expenditure of about $40,000 in the paving project. Future use of the East Lake carhouse has not been definitely determined by company officials, but this property will not be sold at present.

Trade Notes

Johns-Manville, Inc., New York, N. Y., manufacturer of building materials, automotive equipment, asbestos specialties, fire extinguishers and electrical products, is to establish a factory in New Orleans. It has leased the building of the American Cotton Oil Company of Gretna. This has 50,000 sq.ft. of space under one roof, and is on a 5-acre site. The first unit will be in operation by April, it is announced.

Magnetic Signal Company, Los Angeles, Cal., has arranged with the General Railway Signal Company, Ltd., Montreal, to handle the magnetic flagman and accessories in the territory of Winnipeg and east thereof. Arrangements have also been completed with the Canadian Fairbanks-Morse Company of Vancouver, to act as agents for all the territory to the west of Winnipeg.

Conveyors Corporation of America, Chicago, Ill., announces the appointment of C. S. Price, First National Bank Building, Hazleton, Pa., as its district representative for northeastern Pennsylvania. Associated with Mr. Price in the sale of the American Steam Jet Ash Conveyor is E. E. Elliott, who has had wide experience in steam jet ash disposal engineering.

Glenn D. Evans has again joined the J. F. Buhr Machine Tool Company, Detroit, in the capacity of chief engineer. Mr. Evans has been chief engineer of the Climax Engineering Company of Los Angeles during the past three years.

New Advertising Literature

G. C. Kuhlman Car Company, Cleveland, Ohio has issued an illustrated booklet on the type G steel-frame bus bodies.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., in a publication called "Recent Developments in the Art," has recorded briefly some of the more important developments which this company has contributed to the electric railway industry during the past two years. This booklet was published for use as a guide reference in the Westinghouse booth at the A. E. R. A. convention last October, the new equipment or parts of equipment included in the exhibit having been marked with an orange star to indicate its newness, and the references in the book are similarly marked. The motive behind each development and advantages of its use over the previous part is briefly related for each subject covered. Another publication issued by the company describes the latest development in HL control, designed primarily for use on low-floor cars. Another leaflet contains application and performance data and construction details of the No. 333-V line of railway motors. An outline drawing with important dimensions is included. "The Trolley Bus—Its Application and Equipment" is the subject of the third leaflet.

Modern Cars Again Prove Their Worth

THE substitution of modern light-weight cars for older and heavier rolling stock on interurban lines of the York Railways and the Johnstown Traction Company in Pennsylvania is told of elsewhere in this issue. Not enough time has yet elapsed since the new cars were put in service to permit an exact calculation of the resultant savings in energy, maintenance, and track costs. But already it is evident that substantial reductions in operating expenses will follow from this modernization of equipment. In addition, the greater popularity of the new cars with the general public is an important consideration.

The experience of these railways is in harmony with that of a number of other interurbans, among which might be mentioned the Kentucky Traction & Terminal Company, the New Haven & Shore Line, and the Aurora, Elgin & Fox River Electric Company. In these and many other cases, modernization of equipment has resulted in reduced expenses and increased revenue.

Under the circumstances it is discouraging to observe the tenacity with which some other interurban railways cling to their old, heavy cars. Faced with rising costs as well as serious competition from the private automobile, they make a great mistake in keeping these antiquated vehicles in service.

"The public is used to these cars and prefers them to the modern, light-weight type," is a frequent argument. In reality, of course, the public would much prefer new cars. Something new always appeals to the popular fancy. That is a large factor in the popularity of the motor bus—it is new. The superiority of the modern car in appearance and comfort is so marked that it is sure to be appreciated.

Some interurban railways claim that they cannot afford to modernize their rolling stock. If it will mean reduced costs and increased traffic, however, such railways are the very ones that can least afford to neglect modernization—and such improvements can be financed.

Specialized Training Required for Publicity Work

A GOOD many laymen think that they understand thoroughly all the problems of the transportation business. In fact, some of them appear to believe they know more about it than do the men who have made it their life work. Yet experience has shown that very often the theories of the butcher, the baker and the candlestick maker fail when put to the test of actual performance.

Railway men are quite familiar with the fact that difficult problems require trained men to handle them. Probably in no other industry has there been a more pronounced tendency and need to utilize the services of specialists in their various lines. This necessity is hardly less compelling in railway publicity work than it is in the engineering department. The successful publicity man must be a specialist in human nature, and must understand the psychology of "the man on the street."

Often a slight change in the wording of a sentence will altogether change the impression it creates. A good example of this is furnished by a suggestion coming from Major J. S. S. Richardson, chairman of the Pennsylvania Public Service Information Committee. He urges that the phrase "educating the public" be avoided and in its place the phrase "informing the public" be used. The general public believes that it is already sufficiently educated, and does not want any more education handed out by the railway. The word "informing," however, causes no such unpleasant reaction.

While it might never occur to a railway executive whose mind is filled with operating problems, this suggestion is so reasonable that it is necessary only to hear it to realize that it is good. Coming, as it does, from an experienced publicity man, it serves to emphasize the value of having a specialist handle the work of that department.

Maintenance Shop Practices Will Bear Close Study

IN THE issue of last week was published an article describing some of the many dies and jigs developed by the Chicago Surface Lines to reduce the cost of frequently repeated operations in the shop. This is an excellent example of what can be accomplished by consistent development of such tools.

On many electric railways, along with the tendency to provide insufficient machine equipment, there is also an inclination to overlook the possibilities of applying modern production methods to maintenance work. In some cases special tools enable existing machine equipment to be utilized for a much wider range of work. A good example of this is the ingenious device described in the Chicago article, by means of which an ordinary punch press is made suitable for punching holes from center punch marks in light structural members.

Railway shop machines and tools should, however, not be diverted from the maintenance functions for which they were intended, to the manufacture of parts and equipment that can be purchased more economically from manufacturers specializing in the production of such parts. In most cases this practice of manufacturing parts in the shop is uneconomical. It frequently may appear that some saving is being made due to the use of machines which are already available, but manufacturing operations in the shop are likely to tie up these machines when they are needed for maintenance work. In addition, there is a decided tendency among electric railways to hold down the shop supervisory staff to a minimum. In general, therefore, the entire attention and available time of such men is hardly sufficient for the proper supervision and improvement of purely maintenance methods and practices. When their attention is diverted into purely manufacturing operations, maintenance is bound to suffer. Under such conditions, any small apparent saving in the cost of new parts is more than offset.

When repair parts for apparatus that has been discontinued by the manufacturer are required, the practice of making them in the shop sometimes is justified. Under these conditions the parts are usually used in such small quantities that the cost of having them made up special by the manufacturer who no longer carries these parts in stock is too high. As pointed out in the Chicago article, time of delivery also becomes an important factor in determing the procedure to be followed.

This phase of the subject will bear much more thorough study and analysis than it has been given in the past. There is an excellent prospect of reducing in a substantial degree the amount of such special manufacturing work done in the shop. This can be done by a consistently maintained practice of standardizing the many miscellaneous parts and fittings used on cars.

Desirable results can be obtained both in the purchase of new equipment and in the substitution of general standards for many different parts already on the cars, as they come through for repairs. In many cases there is abundant opportunity to eliminate many slight differences in sizes and types, which tend to result in small quantity purchase orders, delays in delivery, and high prices. Thus in many instances where parts are being manufactured in the shop because of high purchase prices, careful grouping and weeding out of obsolete types would result in a much reduced stock list and would allow the size of individual orders to be increased to a point that would command attractive prices.

Train Up a Child in the Way He Should Go

HABIT is stronger than nature, according to an old proverb, and it is a tremendous undertaking to try to change the habits of a nation. Yet this must be done if reasonable individual safety on the streets of our large cities is to be had. Automobiles have completely changed the conditions under which these streets can be used without injury to life and limb. With slow-moving horse traffic there was no call for drivers to be licensed, and there was no great risk when pedestrians crossed the street between corners. With swiftly moving motor vehicles in crowded streets, the need for both careful licensing of drivers and control of pedestrian movement is evident.

Naturally the question of the best way of educating the public to the modern needs of safety in the streets occupied a prominent place in the conference on street and highway safety, held in Washington the first part of last week. The greater part of the report of the committee on education was devoted to methods for teaching the rising generation what should be done. Some suggestions are given as to the ways for reaching adults, and newspapers, posters, movies and the radio are mentioned. But evidently, as pedestrians, adults are expected to know what to do or else to be beyond salvation. It is hard to convince a man who for many years got on and off moving street cars that the closed platform is a good thing, or that it is unsafe to thread his way between crossings through a maze of moving automobiles. But the case is more hopeful with children, to whom a horse is almost a relic of a past age. Proper stress is laid in the report on interesting youth in safety by active participation in it, as through schoolboy patrols and junior safety councils, just as physics and chemistry are taught by laboratory methods. With the children taught there is hope for the elders through precept and example, because in many cases it is very true that the child is father to the man.

Protecting Transportation for the Sake of the Public

SOMEHOW transportation service lies closer to the heart of the average man than does the service rendered him by any other utility. He is more jealous of his rights as a patron of the trolley company than he is of his rights as a customer of the electric company. For this reason, where railway rates or service are concerned, he is particularly critical of the work of the public service commission. Nevertheless, rising costs of labor and material, as well as the increasing competition of the private automobile and the bus and truck, have made the problem of maintaining the financial stability of the necessary transportation systems a grave one. Commonly, therefore, the public service commission is indeed between the devil and the deep sea.

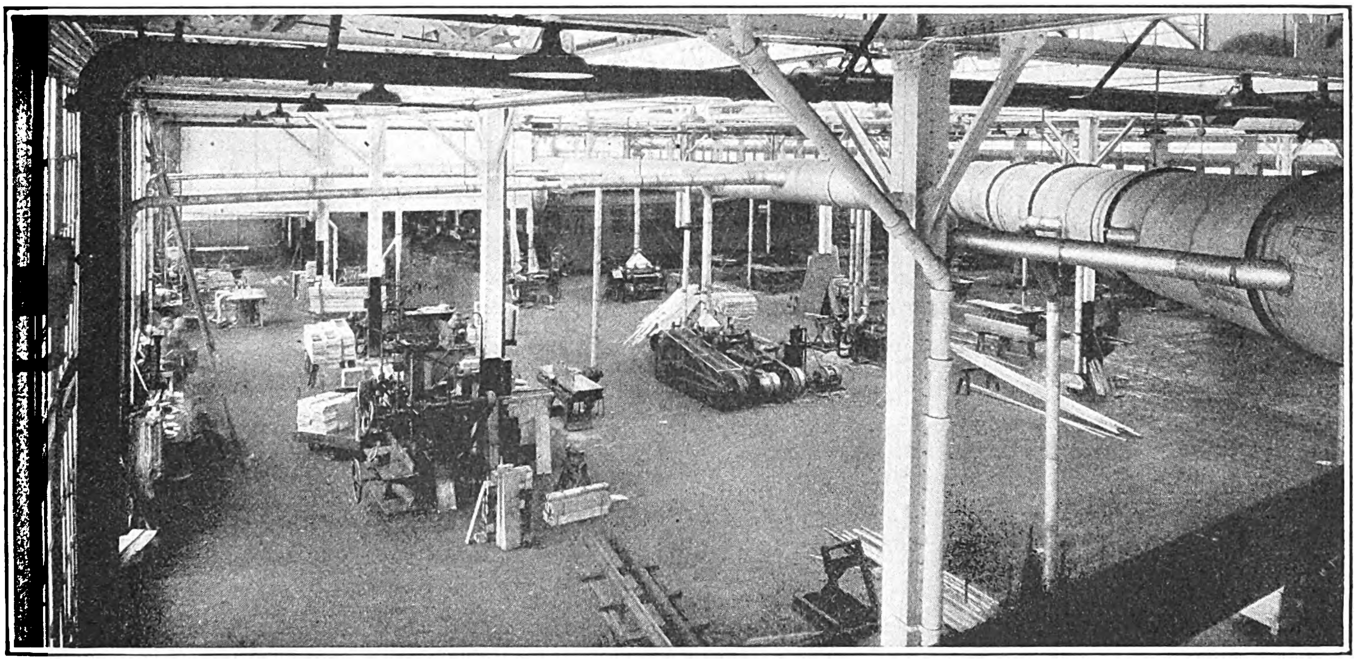
For example, if an application is made by an independent bus operator to run over a route where his service will duplicate that of an existing railway, a regulatory body would ordinarily refuse to grant it. But it is difficult for people to understand why the commission should thus deprive the people of a service which would be a convenience for them. They feel that if some one is willing to provide the service he should be allowed to do so, and they are inclined to regard the refusal of a permit under such circumstances as an act of favoritism to the railway. In order to attain the best results in the end, however, it is necessary often more or less to disregard the immediate effect on the public temper.

To the credit of the commissions it must be said that decisions are made after careful investigation by experienced men. If the outcome is sometimes displeasing to the railway, usually the company is nevertheless willing to admit that it was made in good faith. The public, on the other hand, is too ready to question the motive of the commission. This is no doubt due to a lack of understanding of the considerations upon which the decisions are based. When the people, through longer experience, become more familiar with the methods of regulatory bodies and realize that the latter must protect the transportation systems for the sake of the public as well as for the sake of the stockholders, they will probably come to repose a greater confidence in the wisdom of these decisions. This points to the need for more informative publicity along these lines.

Boston "L" Woodworking Shop Uses Individual Drive

Third Article

A Great Variety of Equipment Is Installed for Car Repair Work in New Everett Shops—Machine Shop Is Temporarily Housed in the Wood Shop—Method of Stripping and Rebuilding a Car Described



Noteworthy Features of the Wood Mill Are the Individual Motor Drives for All Tools and the Suction Dust Collecting System

THE section of the new Everett shops of the Boston Elevated Railway now used as a carpenter shop and wood mill presents a good illustration of individual motor drive. Induction motors are used mainly, operating on a three-phase, 60-cycle, 550-volt circuit. The various tools installed also show advanced practice in safety engineering. The accompanying table, which lists the principal motor-driven machines in the shops, indicates that there is a greater variety of machinery than ordinarily has been available for car repair work on electric railways.

The many woodworking processes at the Everett shops can in general be divided into two classes: (1) Repair jobs on rolling stock, and (2) production of materials or parts used in quantity by the company in any branch of its service. Ample facilities for quick repair are afforded by the trackage in this building and its connection with the transferway. Most of these tracks are carried at least two-thirds of the way across the building. To facilitate the work until future craneways are available two body hoists built by the company and a jib crane are installed in the northern portion of the shop.

The latest types of equipment of the mill include a rip saw, doweling machine, belt sander, high-speed shaper and a disk sander. These embody various features of design which increase the convenience of operation, render the work safer and reduce obstruction to the movement of men and materials in the mill. Several of the motors are mounted inside the machine frames or above the floor level and out of the way of the user. Control equipment is located as a rule within easy reach of the machine operator, and a general scheme of screening these tools and their drives adds to the safety of the installation. All tools above 7 hp. have General Electric switches, by which the compensators can be "killed" in connection with repair work. While the operations performed by these machines and other equipment were carried on to some extent in the older shops of the company, with this later equipment more rapid production is possible through easier settings of cutting devices, more automatic regulation of processes, multiple cutting and higher powered tools.

Some of the articles regularly made in the wood mill are cross arms, third rail shoe beams, seats for trainmen, surface car life guards, feeder switch boxes, track switch parts, toilet sets for stations, office furniture, trolley planks, car flooring and car doors. Repairs to cars brought into the shop on account of collisions or other accidents naturally take precedence over routine manufacturing operations.

Wiring Layout for Motors in Wood Mill of the Everett Shops

may be called to the process of making car doors. The lumber is brought from the kiln to the mill room by a service car and the transferway. The lumber is unloaded on the floor and is then hauled on a hand truck to the cut-off saw (*J*), where it is cut into lengths. It is next trucked to the rip saw (*K*) and cut into the desired widths. Thence it goes to the buzz planer (*Q*), where it is finished in two passes. The next machine used is the molder (*S*), which cuts the stock to the proper sizes. The stock then divides, the door stiles going to the mortiser (*Y*) and the rails to the tenoner (*X*). The stiles then pass to the shaper (*V*) for molding and thence to the carpenter shop in the balcony. The rails are also molded by this shaper and are then passed to the bevel saw (*AA*) for "relishing," after which the rails go to the balcony for assembly with the stiles. The door panels when glued together start with the cut-off saw (*J*) and pass through the buzz planer (*Q*) to the mortiser (*Z*), thence to the bevel saw (*AA*) for bringing to size, on to the sander (*FF*) and to the balcony for assembly. The doors are then taken to the mill room floor and edge-straightened in a buzz planer (*Q* or *U*). Next they are cut to the proper length and width on the bevel saw (*AA*), after which the sander (*FF*) is used, the edges are molded by the shaper (*V*), and the doors trucked to the paint shop. They are returned to the mill room for glazing. The beading is cut up in the rip saw (*J*), passes through the molder (*S*) to the paint shop and is returned to the mill for insertion at the time the glass is set. The completed door then goes to the paint shop for installation.

Window sash goes through practically the same operations as the doors. Steel paneling is largely replacing the wooden panels on the company's cars and this work is done in the temporary machine shop section of the wood mill, in the main.

DISPOSING OF WOOD WASTE

The mill building is equipped with a dust and shavings removal system by which all sawdust and other débris are drawn by suction through branch piping into a heavy discharge main leading out of the building and across a bridge to a separating hopper on the top of the extension of the lumber storage building. An accompanying drawing gives the sizes of the various intake pipes leading from the various woodworking machines to the main collecting duct. The piping is supported on the trusses and columns of the building by wire guys and straps. On a balcony in the southwest corner of the wood mill is an 80-in. Sturtevant exhaust fan, belt driven by a 50-hp. motor. A suction of 2½ in. of water is produced when the fan is running at full speed.

The dust and shavings are drawn from the machines and forced into a 36-in. trunk duct. They are discharged into a 36-in. collector with top and body of No. 18 and cone of No. 16 galvanized steel, carried on top of the baling house by structural steel supports. The hopper is about 18 ft. high and 12 ft. in diameter and is fitted with a ¼-in. mesh screen by which the sawdust and shavings are separated to discharge into compartments below where baling takes place in a 7.5-hp. Trojan baling machine. The bales of shavings,

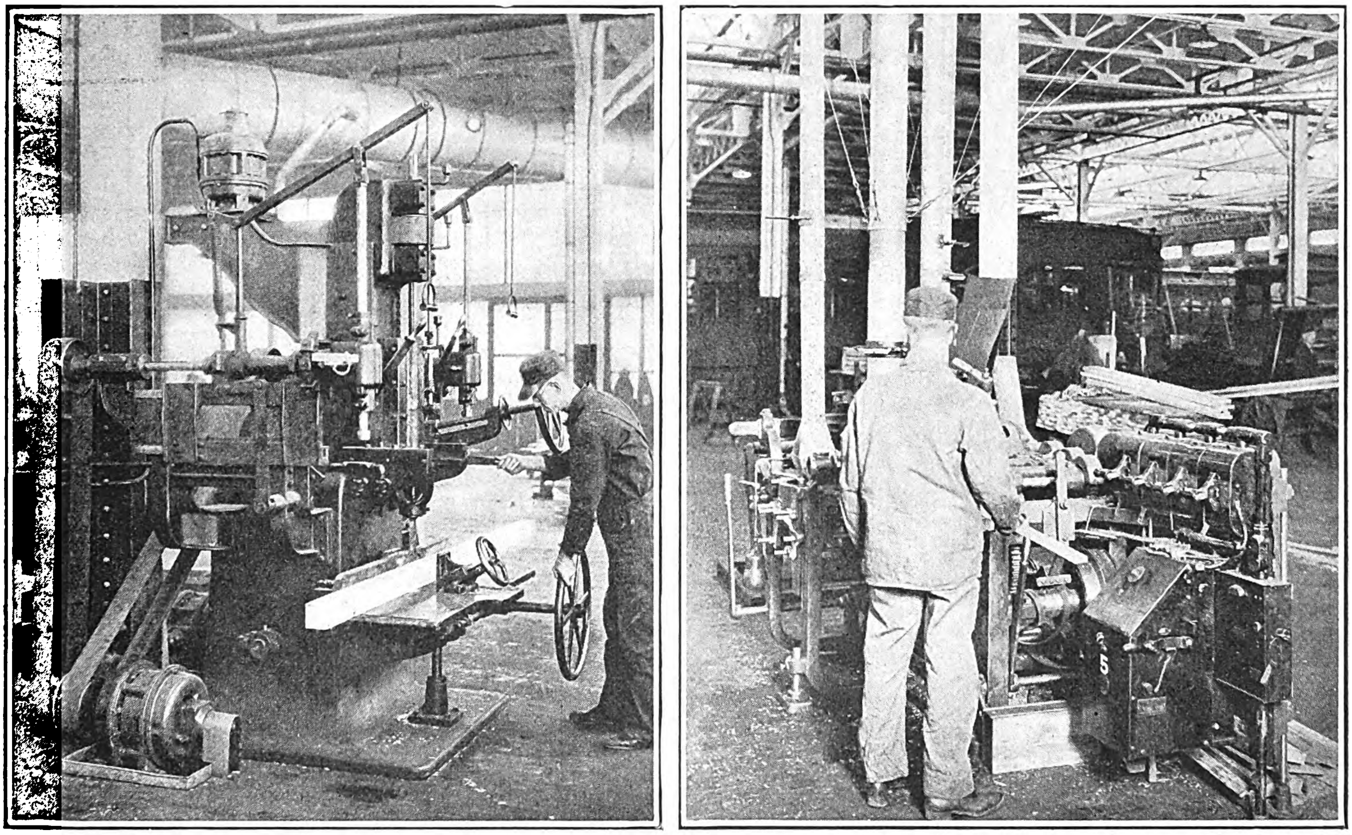
weighing about 80 lb. each, are sold to jobbers. Sawdust is bagged and sold.

A feature of the dust removal system is the installation of floor sweeps with suction openings at the floor level. These connect with the exhaust piping by 6-in. risers having dampers to reduce power requirements when the sweepers are not in operation. Each sweep has an orifice 2½ in. high and 15 in. long. The arrangement is shown in Fig. 4, page 1066.

The wood mill balcony also contains an upholstery shop, cabinet shop and locker room. On the ground floor is a stockroom for miscellaneous hardware used in car repairs and in the temporary machine shop. A temporary brass room also has been provided in the machine shop beyond the stock room. The upholstery shop chiefly repairs curtains, automobile cushions and canvas, there being few if any cushioned seats in the Boston cars.



At Left—Boring and Mortising Machine (N). At Right—Molder Equipped with Five Motors (S)

CONSTRUCTION OF THE BUILDING

The shop buildings are of concrete construction up to and including the first floor, with brick walls and steel sash, steel-supported roof, wood plank and Pond type skylights. The foundations are laid in soft ground. In the design of the roof particular attention was given to secure the maximum amount of daylight. In general the construction of the mill building and paint shop is uniform, although the woodworking shop is somewhat narrower. The skylights were designed with the lower half stationary and the upper half movable to give efficient ventilation. The operating sides are movable portions, are motor-driven and controlled by push-buttons from the ground floor. A run of 150 ft. represents the maximum which can be conveniently handled in a single section.

The wood shop has 22 tracks and a capacity of 36 cars of 50 ft. length. Pits are provided for 17 tracks. The entire floor of the building is paved with treated wood blocks. The southwest portion of the wood mill is used for general heavy woodwork and the northerly portion of the building is temporarily utilized for blacksmith, tin and machine shops, pending the construction of the metal-working shop north of the present building.

The finished floor was laid over the foundation after the rails were installed and the pits were constructed with a reinforced-concrete foundation. The pits are 4 ft. 7 in. deep from the top of the rail to the pit floor, with offset walls. The pit tracks are laid on tie plates anchored to the concrete and spaced on 24-in. centers, the rails being fastened by standard rail clips spot welded. A small amount of heat is available in the pits, pipe coils being run in the offset on one side. Light outlets are installed on the other side, with extension cords hung up so that they will be out of the way when not in use.

The transfer table, which was built by George P. Nichols & Brothers, Chicago, has a speed of 6⅜ m.p.h. and a weight loaded of 100 tons. It was found that it would be a considerable undertaking to provide a suitable bumper which would stop the table without damaging it, and so the engineers of the railway company installed a so-called natural bumper, with a slope of 30 deg., built of cinders covered with 6 to 8 in. of crushed stone. This has proved satisfactory, as the table will run into it without derailing and apparently without injurious result, either to the table or to the end wall of the transferway.

An Elwell-Parker 3,000-lb. industrial electric crane truck is used for many services about the shops, particularly in handling electric motors and other parts to and from the temporary machine shop, in moving trailers on and off the transfer table and spotting cars on tracks.

At present 373 men are employed at the Everett shops.

ROUTINE OF HANDLING CARS NEEDING REPAIRS

When a car inspector, with the approval of a district supervisor, has sent a car to Everett it is placed on a side track to await inspection so as to determine just what repairs are needed. These often exceed the recommendations of the transportation department, as rotted sills and posts cannot be seen until the sheathing is stripped off and the frame exposed. When a berth in the shops becomes vacant, the next car scheduled for repairs is transferred from the yard to this berth.

As soon as a crew of men has completed another car, they are assigned to the one just placed in the shop. Their first duty is to strip the car unless it is one that has been painted comparatively recently and has just been involved in an accident. In this case the needed repairs are made, the paint is retouched and the car released. About 225 cars per year are sent into the shops on account of collisions.

When a car is stripped all window screens are removed, transferred to the machine shop for repairs and thence delivered to the paint shop for cleaning and dipping. Sash and doors are removed and sent to the sash and door department. The door-operating mechanism is taken down and thoroughly overhauled. Seats and backs are all put in first-class condition and sent to the paint shop for cleaning and repainting. The seat frames are all gone over and any found defective are removed and repaired. Metal and brass hardware is

MISCELLANEOUS EQUIPMENT

16 Heater blower motors, G. E., 5 hp., type KT 731, conduit type N 4 control.
1 15-kw. Fairbanks-Westinghouse-Crawford electric oven in wood mill.
2 Pump motors, 3 hp., 900 r.p.m., 550-volt, conduit type I starting switches.
Window sash mechanism, 16 G. E., KT 22-hp. motors; Fairbanks-Morse RC 4 starters.
2 Salem electric elevators, each with 30-hp. G. E. MT 332 motor and Cutler-Hammer control.
1 32-kw. Crawford-Westinghouse electric oven, ½-hp. blower motor.
1 7.5 Crawford-Westinghouse electric oven, Westinghouse type F magnetic contactor.

all removed and sent to the brass room for cleaning, repolishing and lacquering. If the car is old and shows indications of rotten framing it is further stripped of all outside sheathing and possibly the floor is removed.

From this point the rebuilding begins. All rotten portions, such as posts and framing, are removed carefully and sent to the mill, where exact duplicates are made, this being found more economical and quicker, with the modern machine tools available, than the old method of trying to fit new parts to the car at the repair track. The original timbers are cut in many ways to fit the contour of the car and to allow clearance for rivet heads, bolts, angles, etc. Sheathing plates, if badly corroded or bent, are sent to the sheet-metal department to be straightened or duplicated. Bumpers, if badly bent, are taken off, reheated and are then reshaped.

Gradually every part removed is returned to the car renovated or duplicated, the framing is replaced and spliced, the car resheathed, the floor laid and every detail gone over and made good. The doors and windows are put in and the car sent to the paint shop. There the final trimming of hardware is replaced, seats are put in and window screens are attached, glass cleaned and the final trimming is done just before the car is sent out.

Boston-Lowell Buses Run Express

Parlor Car Service Recently Established by the Eastern Massachusetts Street Railway on this 27-Mile Route Supplements the Rail Service Between These Cities

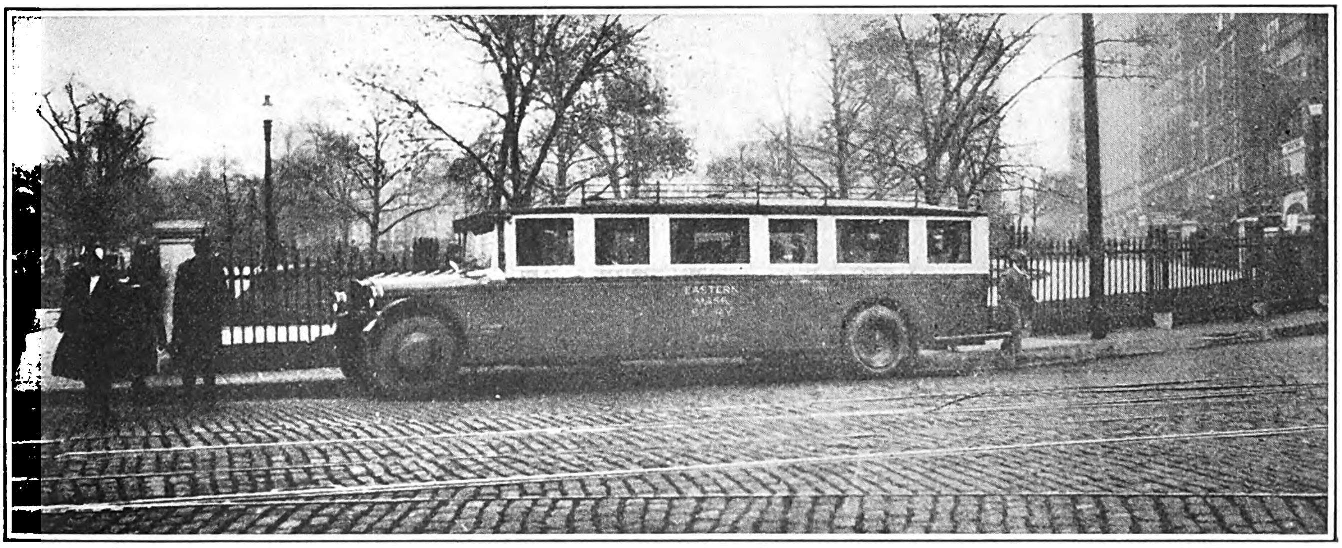
EXPRESS bus service or, as the railway prefers to call it, motor coach service between Boston and Lowell was inaugurated by the Eastern Massachusetts Street Railway on Oct. 1, 1924. To a certain extent this service takes the place of a street car route which was abandoned some time ago because of poor patronage. It serves also to supplement the service on an existing car route which is operated from Boston to Lowell via Chelsea. In order adequately to take care of local passengers it is necessary to make all stops along this line, and for that reason the company felt that it would be worth while to undertake express bus service for the through passengers between the two cities.

Park Square, Boston, is the southern terminus, and from there the route goes out Charles Street across the Charles River and then via Cambridge Street to Massachusetts Avenue, just beyond Harvard Square. Then it follows what is known as the "back road" to Lowell. This highway has recently been repaved by the State of Massachusetts. By following these streets from Boston through Cambridge the traffic congestion on the more popular streets is avoided and considerable time is saved.

The route is 27 miles long and the running time is approximately 1 hour and 10 minutes. This is slightly more than the ordinary running time of trains on the Boston & Main Railroad between these cities, and is considerably longer than the time of express trains. On the other hand, the fact that the buses start from the convenient Park Square terminus in Boston and reach a convenient point in the center of Lowell makes this service more attractive in that respect than the railroad service, which starts from and arrives at stations less centrally located. The fare on the bus is $1 and on the railroad 93 cents. At both ends of the line illuminated signs made of wire glass have been conspicuously placed on electric light poles to inform the public concerning the service.

TERMINALS ARE CONVENIENTLY LOCATED

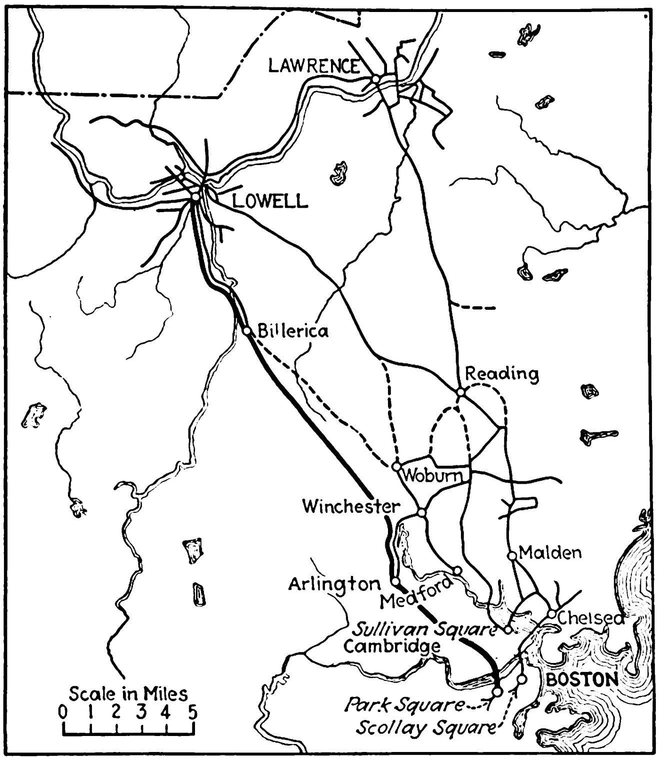
When this operation was first undertaken ten round trips were run per day, the first leaving Lowell at 7.30 a.m. and the last at 9.30 p.m. Leaving Boston the first trip was at 9 a.m. and the last at 11:15 p.m. Traffic has varied greatly from day to day, ranging between about 300-passengers as a minimum and 600 passengers as a maximum. For the first six weeks after the commencement of bus operation an uninterrupted period of fair weather prevailed. Saturday, Sunday and holiday riding has been heavy. Recently the increase in the number of passengers carried caused the railway to increase the service. On Nov. 8 an hourly headway throughout the day was established in both directions.



Express Bus Operated by the Eastern Massachusetts Street Railway Between Boston and Lowell Loading Passengers at the Park Square Terminus

Because the running time in each direction is slightly more than an hour, the company thought that it would be undesirable to try to operate an hourly headway with only two buses. For that reason three buses are now in service all day, with fairly long lay-overs at the ends of the line. By starting the trips from Lowell on the even hours and from Boston on the half-hours the lay-over time has been divided equally between the two places.

Five Fageol coaches are available for this service. On Saturday afternoons, however, when important football games were being played in Boston, it was necessary to augment the service by the use of street car type buses, borrowed from other routes operated by the railway. A plan is under consideration at present to increase the seating capacity of the Fageol coaches from 24 to 30.



Two Routes Are Operated by the Eastern Massachusetts Street Railway Between Boston and Lowell. Trolley Service Is Via Chelsea, While the Express Bus Service Operates Through Cambridge

The buses are maintained in a space specially set aside for that purpose in the carhouse at Lowell. An experienced automobile mechanic is employed to take care of them. Ordinarily each bus is inspected every third day, or at the end of approximately 600 miles of operation.

Part of the route, which is shown on the accompanying map, is on streets where the Boston Elevated Railway operates surface cars. Another part is on streets where the Eastern Massachusetts company operates. This will simplify the problem of snow removal in winter because the railway snow-fighting equipment can clear a considerable portion of the bus route. The stretch of road where the railway plows cannot operate is only a few miles in length. This being a state highway it is expected that the state will keep it clear. In an emergency, however, the railway is prepared to clear a path for its buses by means of snowplows on its heavy motor trucks.

In accordance with the laws of Massachusetts, the permit for the operation of this line is of only one year duration. Such short term license, however, is not the serious disadvantage to a bus line which it would be for a rail line. The company feels that there may be room for the establishment of similar routes in this territory. In general, however, it is thought that the replacement of railway lines by bus lines has already proceeded in Eastern Massachusetts about as far as it is likely to go.

Giving the Riders Somewhere to Go*

Charleston Consolidated Railway & Lighting Company Leased an Amusement Park and Made a Profit of Nearly 120 per Cent in Two Months

AT ONE time the comment was often heard concerning the street railway in Charleston, S. C., that "It doesn't take you anywhere." In other words, the various routes linked the business and residence districts together but they reached practically no amusement resorts. There are two parks for white people, but in spite of the great natural beauty which they possess, they have not attracted many pleasure seekers. The railway considered the possibility of converting these parks into sources of traffic for itself, but it was felt that a large majority of the frequenters of the parks were automobile owners and that it was not worth while to try to build up an amusement resort for white people.

With the colored people, however, the situation is different. A property known as Grant Park, located on a suburban line about a mile beyond the city limits, was successfully operated by the railway before the war. In the spring of this year it was decided to negotiate with the owner of this park with a view to its operation during the summer. An agreement was reached whereby the railway paid $250 toward the renovation of the buildings and agreed to furnish music and prizes for dances to be held at the park.

Tickets were furnished by the conductors to colored passengers alighting from the cars at Grant Park. On nights when dances, band concerts, or picnics were held, these tickets entitled the possessor to free entrance. All such tickets collected above 150 in number were redeemable, if presented by the owner of the park to the management of the railway, at 2½ cents each. The first 150 collected each day were used to reimburse the railway for its expense in furnishing music and other entertainment features.

During the first two months' operation the railway carried approximately 8,000 park passengers at 25 cents per round trip, making a total of $2,000. The largest single item of expense to the company was the extra service run to the park. This cost somewhat over $400 and the other expenses brought the total to slightly more than $900. The net profit of the operation was therefore in the neighborhood of $1,100. This experience has convinced the railway that it can profitably increase its park appropriation for another year. It proves, in the opinion of the management, that it pays to give the riders "somewhere to go."

---

Many Railway Improvements in Central Pennsylvania

New Cars, Extensive Track Reconstruction, Better Shop Facilities and Bus Operation Are Among the Recent Developments at Johnstown, Altoona, Harrisburg and York

By Spectator

The Center of the Square at York Is Reserved as a Loading Area for Trolley Passengers

PENNSYLVANIA is always an interesting state from an electric railway point of view. It has more individual companies than has any other state in the Union and its total electric railway mileage is exceeded only by that of New York. It is particularly interesting, however, on account of the number of up-to-date street railway systems in its moderate-sized cities. Johnstown, Altoona, Harrisburg and York are four such cities, ranging in population from about 50,000 to 75,000 and located comparatively close together in the central part of the state. In all of them important improvements have lately been made in track, shops and rolling stock.

Considering the size of Johnstown, which is credited with a population of only 67,327 by the census of 1920, a surprisingly large outlay has been made by the Johnstown Traction Company to improve its service during the last few years. Since the beginning of 1920 more than $850,000 has been expended for track reconstruction and paving. Every year the amount spent for this work has increased, as shown in the following table, which was published in a newspaper advertisment wherein the railway explained some of its problems to the public.

1920	$105,029
1921	140,721
1922	143,331
1923	222,869
1924	239,520

Installation of an extensive new system of sewers in the city has necessitated much of the track reconstruction. This new system is not yet completed and the railway is faced with the necessity of making similar large expenditures for some time to come.

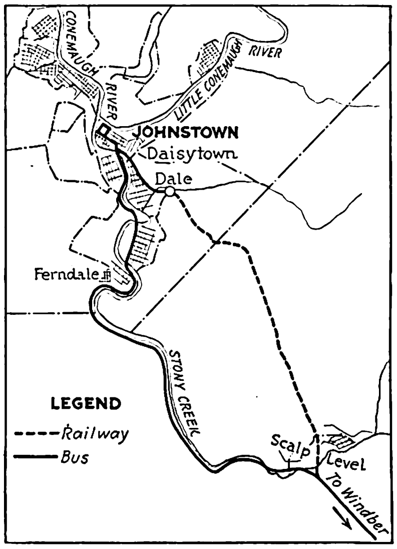
These heavy demands upon the company were one reason for an application filed in the fall of this year with the Public Service Commission for a slight increase in fare. This was put into effect in September. The ticket rate was increased from four for 28 cents to four for 30 cents, or, in other words, from 7 cents to 7½ cents per ride, while the cash rate was increased from 7 cents to 10 cents. There has been practically no opposition to this increase because most people realize the reasonableness of it. One interesting result, however, has been the greatly increased use of tickets. This has grown by leaps and bounds until now 98 per cent of the revenue passengers use tickets. In fact, strangers in the city are almost the only ones who pay the 10-cent cash fare.

The railway is gradually extending the use of one-man cars by rebuilding some of its older rolling stock. In the reconstruction of a number of double-truck cars for one-man operation, the seating arrangement has been altered with a view to encouraging passengers to move to the rear of the car. Formerly these cars had longitudinal seats and were operated with rear entrance and front exit. Now, however, five cross seats have been installed on each side at the back end and the heater has been moved from the middle of the car to the back platform. In place of the old rear entrance door a small emergency door has been provided. On the far side of the rear platform has been placed a semi-circular seat. By this means the total seating capacity of the car has been increased somewhat and it has been found that the universal desire to ride in cross seats causes passengers to move to the rear of the car.

Soon after the completion of a new concrete state road between Johnstown and Windber applications were made by a number of independent bus operators to run over this route. Windber is a mining town of about 12,000 inhabitants. The traction company, however, operates an interurban line between these places, and it was felt that competitive bus operation between the same points would be likely to affect its revenue seriously. Accordingly the railway itself made application to operate bus service over such portions of the route as were not conveniently served by its cars.

At some places the state highway is as much as 3 miles away from the car line and the bus route was laid out with a view to serving the people living in this district. The railway line goes all the way to Windber, a distance of approximately 12 miles. The bus line, however, stops at Scalp Level, about 9 miles from Johnstown. The company felt that bus operation between Scalp Level and Windber would be only a needless duplication of its existing service.

The bus route begins at the end of the city car line in Dale Boro, as shown on the accompanying map. The fare is 40 cents to Scalp Level, including the fare on the connecting city car line. Inbound a free transfer is given from bus to car. This rate is considerably higher than the fare on the electric line, which is only 30 cents through to Windber. A single bus is operated on a one-hour headway, covering about 200 miles per day. On weekdays the passengers number about 200, but on Saturdays more are carried. On account of the many severe grades in this territory bus operation is expensive and the line shows a considerable loss. Nevertheless this is to be preferred to having independent bus operation on the route.



Bus and Car Routes Between Johnstown, Scalp Level and Windber, Pa.

Two other short bus routes are operated by the company. These are feeder lines into districts not served by the cars. All these bus operations are carried on under the name of the Traction Bus Company. An interesting characteristic of the service is that each driver has his own bus. When a relief is made not only is the operator changed, but also the bus itself. This method, the company has found, results in the driver taking a greater interest in the care of the vehicle. In all, five buses are owned, three of which are in regular service while two are spares.

Railway service between Johnstown and Windber has also been improved recently. Three new light-weight interurban cars were purchased from the Kuhlman Car Company and placed in service during the summer. These cars are operated by two men and the headway is 40 minutes, or slightly shorter than the bus headway. The railway is now considering the purchase of some more new cars.

CHANGES AT ALTOONA

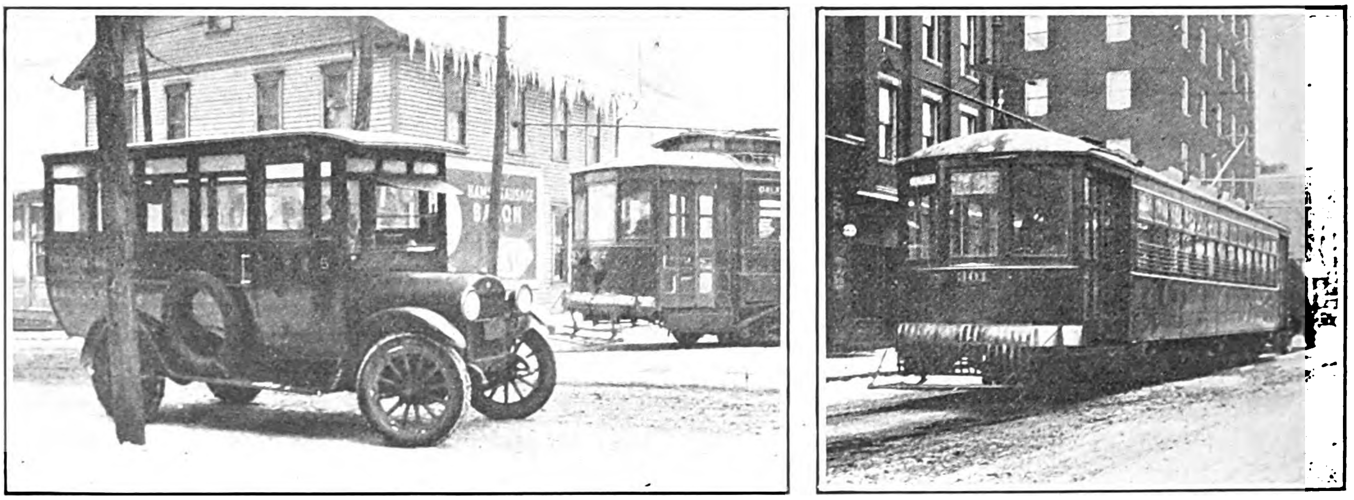
A striking change is soon to come over the railway situation in Altoona. The color of the cars is to be changed from dark green to cadmium yellow. This will be a great improvement and should have a distinct tendency to encourage riding. Due to climatic conditions and the fact that it is a great railroad center, Altoona often has a rather gloomy aspect. Despite the best efforts of the shop department to keep them fresh looking the dark green street cars blend altogether too well with the murky atmosphere.

In making this change the company is following the precedent which it set when selecting a color scheme for its buses. The buses operated by the Altoona & Logan Valley Electric Railway have a bright red body and a yellow roof. A yellow band encircles the body just below the window. On this the name "Logan Valley" is painted in blue letters.

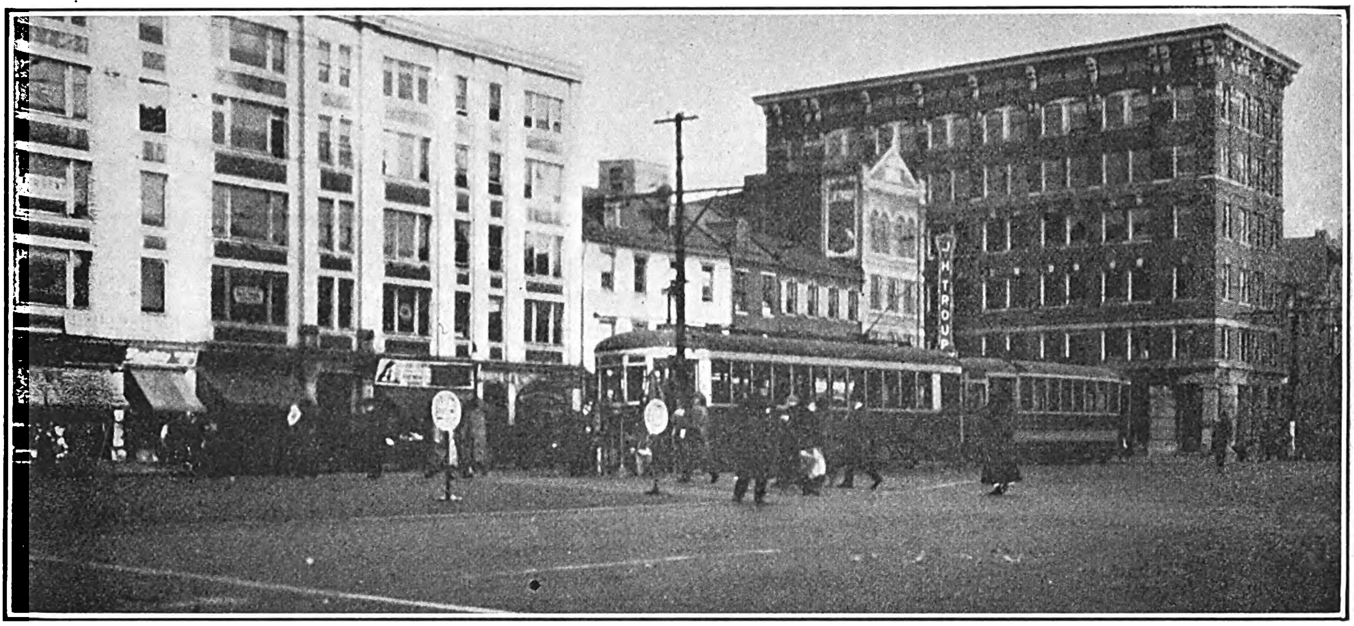
Like many other and bigger towns Altoona, which has a population of approximately 60,000, is worrying about traffic congestion. A survey of street traffic was recently made by the railway at one of the busiest intersections in the downtown district. This count was made from 8 a.m. to 6 p.m., and it was found that street cars comprising only 7.8 per cent of the total number of vehicles carry 74 per cent of all passengers. The figures for various types of vehicles follow:

	Vehicles	Passengers
Autos and trucks	6,401	12,802
Street cars	556	36,000
Motorcycles	18	18
Bicycles	162	162
Horse drawn	22	22
Total	7,159	49,004

Expressed in terms of lineal feet of street space occupied, 100 passengers in street cars require 60 ft., whereas the same number in automobiles require 750 ft. Even with the larger traffic carried, the street cars during the 10 hours of the survey occupied less than one-third the street area taken by the automobiles. These data have been presented to the police department for consideration in connection with their study of the traffic problem.



Left—The Scalp Level Bus Meets the City Car Line at Dale Boro. Right—One of the New Light-Weight Interurban Cars Operated on the Windber Line of the Johnstown Traction Company



The Square at Harrisburg. The Railway Here Is Fortunate in Having Rolling Stock of Uniform Appearance

A number of streets in the business district of Altoona are now restricted to movement in one direction. There is some talk of changing the direction of traffic on two of these streets. Such a change would involve rerouting of the cars and the installation of new special work. Along with this it is planned to install a system of interlocked traffic signal lights. Just why the city wants to do this is difficult to understand. The arrangement of streets and traffic conditions at the different intersections are such as to make it practically impossible that interlocked signals would facilitate traffic movement. On the other hand, they would undoubtedly be a considerable hindrance to the 74 per cent of the people who ride in street cars.

In its shops the railway is carrying out a number of important although not spectacular improvements. Some new machine tools that have been installed have given very satisfactory service and it is planned to purchase others. Improvements have been made also in the power house, particularly in the arrangement of switches and control panels. The railway buys power from the Penn Central Light & Power Company, but it maintains sufficient facilities of its own to operate in an emergency. Ordinarily its own power station takes care of the steady, all day load and relies upon the Penn Central to carry the peak.

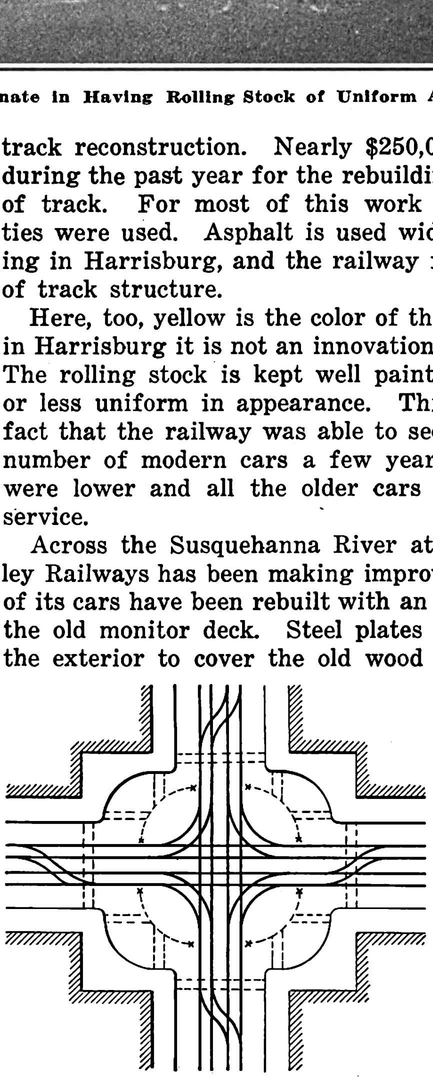
PULL-INS REDUCED AT HARRISBURG

Probably the most interesting thing which has recently been done by the Harrisburg Railways is the reduction in the number of pull-ins. Since the first of the year the average number of car-miles per pull-in has been increased from somewhat less than 3,000 to nearly 15,000. This has come about as the result of a systematic campaign to determine the reason for every pull-in and to eliminate those causes which were responsible for the greatest number. Much improvement has been effected since the installation of dipping and baking facilities at the shop. These will be described in a separate article in ELECTRIC RAILWAY JOURNAL. A change in the kind of waste used in packing journal boxes was another move which is thought to be responsible for the elimination of many pull-ins.

As at Johnstown, large sums have been expended for track reconstruction. Nearly $250,000 has been spent during the past year for the rebuilding of about 5 miles of track. For most of this work International steel ties were used. Asphalt is used widely for street paving in Harrisburg, and the railway favors a rigid type of track structure.

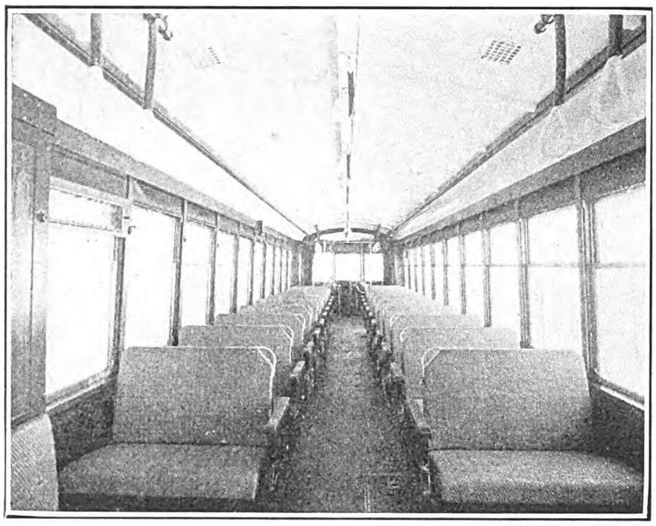
Here, too, yellow is the color of the car exteriors, but in Harrisburg it is not an innovation as it is at Altoona. The rolling stock is kept well painted and is all more or less uniform in appearance. This results from the fact that the railway was able to secure a considerable number of modern cars a few years ago when prices were lower and all the older cars were retired from service.

Across the Susquehanna River at Lemoyne the Valley Railways has been making improvements, too. Some of its cars have been rebuilt with an arch roof replacing the old monitor deck. Steel plates have been used on the exterior to cover the old wood sides and give the car a more attractive appearance. Rumors are afloat concerning the possible sale of this railway to a holding company, but no definite announcements have yet been made.



City Cars Leave the Central Square at York, Pa., on the Hour and at 5-Minute Intervals Thereafter

In the late fall the York Railways commenced the operation of new light-weight cars on the Red Lion and Windsor line. This is a 13-mile interurban line with single track and turnouts. The running time outbound from York is 46 minutes and inbound it is 52 minutes. There are two reasons for the difference—one being that the inbound route from Windsor to Red Lion is generally uphill, and the other that a 3-minute layover occurs inbound at Red Lion.



An Interior View of the New Interurban Car of the York Railways, Showing the Linoleum Floor Covering and Arm Rests

The cars were built by the J. G. Brill Company and one of them was on exhibition at the American Electric Railway convention at Atlantic City. As delivered by the manufacturer the car weighs 38,962 lb., but the actual operating weight is 39,400 lb. Four General Electric No. 247 motors are used per car.

In general appearance the new cars differ somewhat from any heretofore used by this company. The sides are curved and an arched window has been placed in each corner. The sides of the car are of Plymetl and the roof is of Haskelite. Special pains have been taken to make the interior of the car attractive. The floor has been covered with linoleum and arm rests are provided for the seats. The interior finish is light mahogany and an interesting feature is that all piping, etc., has been painted in accordance with the interior finish to make it as inconspicuous as possible. Seats are on 33-in. centers. Altogether seating accommodations for 52 passengers are provided.

These cars replaced older equipment weighing 55,000 lb. An important reduction has been effected in the energy used. Three cars of this type, enough to equip this line with one to spare, have been purchased. Two similar cars but of smaller capacity have been ordered for use in city service.

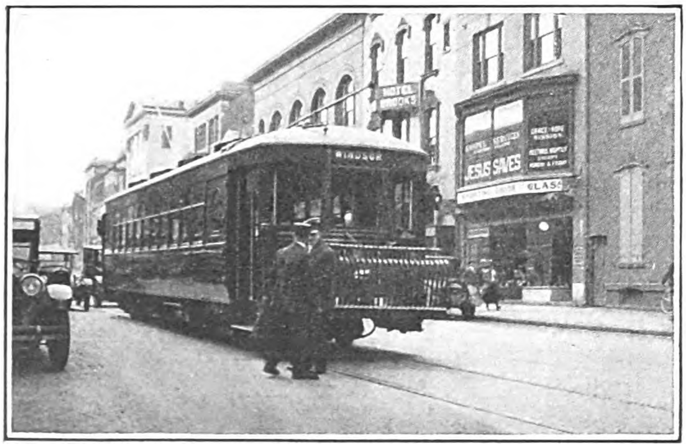
In common with many Pennsylvania towns the city of York has a central square, where the two principal business streets intersect. By painting white lines on the pavement and placing stanchions at intervals the city has laid off a circular area in the center where trolley passengers may wait for their cars. All vehicles other than trolley cars crossing the square must follow a circular path around the outside end of the loading area. Vehicular movements are controlled by interlocked electric light signals at each approach. These are so arranged that wheeled traffic stops and goes simultaneously, while pedestrians have the right of way on all crosswalks during the intervals between vehicular movements.

All the car routes of the York Railways reach this square. On one street two city lines operate on a 10-minute headway, giving a 5-minute joint spacing. On the other street three lines operate, each on a 15-minute headway, giving a similar 5-minute service. Schedules have been so arranged that connecting cars meet at the square. Cars discharge passengers before crossing the intersection and then proceed to the far side to load. On the hour and at 5-minute periods after the hour three or four cars leave the square simultaneously in different directions.

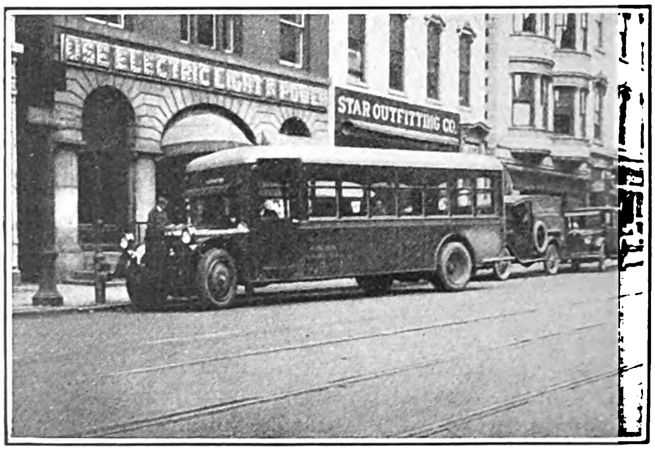
On account of the large number of railroad crossings at grade and also because of the comparatively high schedule speed of the street railway, two-man cars are operated on most of the lines. These are single-truck cars weighing 23,500 lb., built by the J. G. Brill Company in 1922. General Electric No. 247 motors are used with 26-in. wheels. The schedule speed is 10.3 m.p.h. and the cost of operation averages somewhat below 30 cents per car-mile. The present rolling stock on these city lines will soon be augmented by the new cars already mentioned.

An interurban bus line from York through Loganville and Shrewsbury to Turnpike has been operated by the York Railways for about a year. Bus operation is carried out under the name of the York Transit Company, a subsidiary of the railway. This company also operates two other bus routes, which have been so poorly patronized that application was made to the Pennsylvania Public Service Commission for their discontinuance, as told in the ELECTRIC RAILWAY JOURNAL for Nov. 29. The results on the Turnpike route, however, have been more encouraging, and up to the present this line has been paying a little more than its operating expenses.

The length of the route is 14.15 miles one way and through fare is 65 cents. For intermediate points, the fare averages between 4 cents and 5 cents a mile. Commutation rates are in effect for those who use the service regularly. On weekdays three round trips are operated, while five trips are made on Saturday and two on Sunday.



New Cars of This Type Have Reduced Energy Consumption on the Windsor Line of the York Railways



New Fageol Bus Loading in Front of the Traction Office at York Before Starting for Turnpike

A new 29-passenger Fageol bus was recently placed in service on this route. Cars of the railway are painted green, but the color scheme of the bus is orange and royal blue, with a gray roof. The reason for the adoption of these colors was the desire to give the vehicle a distinctive appearance and attract public notice. It is expected that with this new bus the operating cost will be lower and that the traffic will be increased.

An outstanding feature of the electric railway situation throughout the state of Pennsylvania is the freedom from cut-throat bus competition. The attitude taken by the Public Service Commission is an eminently fair one. No needless duplication of service is permitted, and the railways have thereby been enabled to improve their facilities to a greater extent than would have been possible if they had been constantly harassed by uneconomic competition. On their part the railways have done much to supply feeder service.

Work of the Baltimore Mileage Bureau[*]

New System Installed Obtains Mileage by Lines, Days, Individual Cars, Etc.—Automatic Tabulating Machines Make Calculation for Any Desired Classification Quick and Accurate

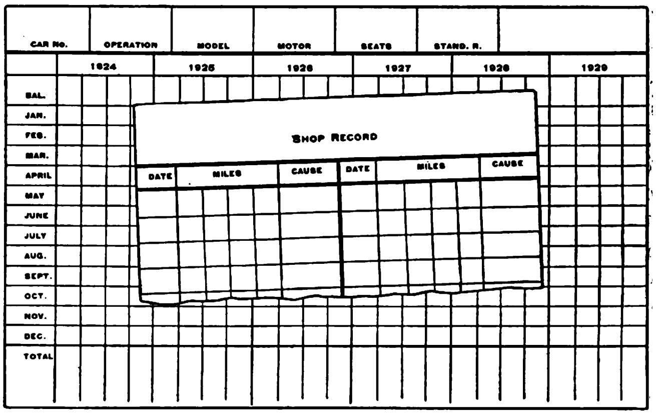
BEING dissatisfied with the accuracy and completeness of its car-mile figures, the United Railways & Electric Company of Baltimore, Md., installed a new system of recording mileage, beginning with Jan. 1, 1924. This was done with the idea of increasing the accuracy of its figures, reducing the bulk of the record, and at the same time making available to the operating department a larger amount of information than it had previously been able to secure.

This company operates approximately 1,500 cars over 35 lines. Each line, however, has a number of runs, a run being defined as a trip over a designated route between designated termini, so that, all told, the system must care for approximately 200 different runs. The total mileage for each of these runs must be determined daily and checked against the schedule requirements. There must also be a monthly and an annual summary of the mileage by runs, by lines, and for the system as a whole, as a general measure of the service that is rendered.

The true measure of service is not so much the car-mile as the seat-mile and also, though to a lesser extent, the standing room-mile or the product of the standing capacity in excess of the seating capacity into the car-miles run.

In addition to this service information, the mechanical department desires to know the total number of miles operated by each car, not only from month to month but also between any important alterations, such as a replacement of a motor, turning down or replacement of wheels, repainting or other important repairs. It also desires to know the total mileage run by each type of car, by each type of car motor, and by individual groups of cars having any one of a number of common characteristics. It is also necessary to distinguish between various types of operation. For example, the company runs unit motor cars, trains of one motor car with one trailer, trains of two motor cars, trains of two motor cars and one trailer, and trains of three motor cars. It is desirable to have an individual record of the mileage made by each car, in addition to the mileage of each type of train in such operation.

The system of recording mileage is based on the use of automatic tabulating machines. The basic information furnished by the line superintendents at the various carhouses is arranged to make the tabulating easy.



The Permanent Index Is on 5-In. x 8-In. Cards, Which Carry the Monthly Figures for 6 Years and on the Back a Record of Pull-Ins

Each run is given a code number, the first two figures of which indicate the line and the last two the particular run on that line. Each morning a report of the previous day's operation is sent in on a form which contains the code number, the number of each car operated during the previous 24 hours, whether motor or trailer, and the number of trips of each type of operation made on that particular route. The line superintendent totals the number of trips and signs the report.

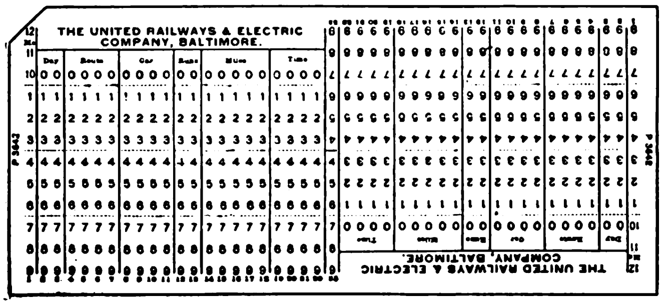
Each line superintendent is furnished by the traffic department with a number of schedules corresponding to variations in service from day to day during the week. When it is necessary to vary the runs from the schedule, in order to give extra trips or to curtail the service, due to temporary conditions, it is reported on a single sheet for each line. The report slips of all the runs on a given line and the reports showing variations from the standard schedule for that line are placed in a single envelope 4¾ x 11 in., as shown in an accompanying illustration. This envelope is indorsed with the date, the number of the line, the number of the schedule operated and with check marks opposite the last two numbers of the run codes which are to be found within the envelope. The envelope is then signed by the line superintendent and forwarded to the mileage bureau.

At the mileage bureau the slips for the individual runs are first verified as to their coding and as to the total number of trips made. This is then checked with the schedule requirements for the day, to determine whether the report of extra and short runs is accurate.

---

[*] This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

The slips are then passed to a punch operator, who punches a run master card of the ordinary type used with automatic tabulating machines. The punch card contains columns for the month, day, trip, car number, route, trips, card count, miles, and minutes. A line master card, using the same form, is then punched and the listing by lines, with a grand total for the system, is added to the previous listing. The completed listing, together with the totals of the reports on extra and short runs, is then forwarded to the traffic department for its records.



One of the Punch Cards for Tabulating Individual Car Records

Meanwhile the original report slips have gone back to the punch operators, who punch a card for each car operated on each run. This card, shown in one of the illustrations, contains columns for month, day, route number, car number, number of runs, number of miles, and time. In order to determine the number of miles and minutes operated, a series of mileage tables has been prepared covering any trip likely to be run by a car within the 24-hour period. A typical table of this sort is illustrated herewith. In practice, however, it is not necessary to punch the minutes on anything but the run master card. These cards are then listed and verified and compared with the totals for the individual runs and lines already completed.

Every 10 days cards for individual cars are sorted and filed by car numbers, and at the end of each month the entire list of cards for that month is listed and totaled by individual car numbers. This gives the total car mileage for each car during the month.

It will be noted that the car card is reversible and can be used a second time. The 23d column is divided. The half belonging to each end of the card is used to designate the type of operation. Before the cars are sorted by car numbers, they are first sorted for type of operation, so that the final record at the end of the month shows not only the mileage for each car, but also the type or types of service which the car rendered.

When the monthly listing is complete, the totals for each car are posted to the permanent index, consisting of a 5 x 8-in. card, illustrated herewith. The card is arranged to carry the monthly figures for a period of 6 years. For the sake of convenience, single-unit car operation is indicated by a white card, while the various other types of operation are shown on colored cards. It is obvious that by an inspection of this card, the total mileage of any individual car may be determined quickly from the beginning of the system down to the end of any particular month. It is not possible, however, to determine the mileage to any date other than the end of a month.

When car mileage is desired up to intermediate dates, it is invariably in connection with some shop operation. To prepare the record, the shop is required to report daily the car numbers of all cars entering the shop, and before the cars for that particular car are listed for that month, they are first listed and totaled up to the date on which they entered the shop. This record is entered on the back of the same card, together with the total mileage of the car from the beginning of the system up to the date when it entered the shop. Obviously, the mileage between any two shopping dates is the difference between the two figures opposite those

____
Line Superintendent

Individual Mileage Reports for a Line Are Placed in This Envelope for Transmission to the Mileage Bureau

dates on the back of the card, and no necessity remains for preserving the original punched cards for that month.

At the end of the month a set of car master cards is punched, showing for each car its number, type of operation, car model, motor type, seating capacity, and standing room capacity. These master cards are sorted mechanically under each of the above classifications, listed and totaled. In this way, the total mileage made during the month in each class of service is determined for each class of car and each type of motor. The total number of miles run by a group of cars with a common seating capacity or a common standing room capacity is then multiplied by that capacity and the sum total of these products is the total seat-miles or the total standing room-miles furnished as a matter of public service.

SPECIAL CAR MILEAGE

A serious problem encountered was that of chartered cars or special or occasional trips that could not be coded as running over any particular route. The report made out by the line superintendent for such a car gives the car number and the description by streets of the route which it travels. The determination of the total distance in a complicated system, such as that of Baltimore, has involved in the past an amount of time altogether disproportionate to the value of the information.

In order to handle the problem, a special map of the system has been devised, in which the distance scale is entirely disregarded, the only effort being to indicate each line of track by a line on the map so as to be able to indicate by street names each piece of track and further to indicate all intersecting track by an intersection of lines on the map. All cross-overs, carhouses, or other terminal points are indicated by cross marks on the line representing a given stretch of track. The map is drawn in four colors, and the distances pertaining to each line are written thereon in the same color as the line. These colors are so distributed that no line of a given color at any point in its course meets another line of the same color. Each color stretch is treated as an individual piece of track, with a zero at one end of the line, and the distance is marked in the same color from this zero station to every carhouse or other terminal point, cross-over or connecting curve where cars could turn back or get off the route.

The movement of each special car is reported to the mileage bureau with a description of its route by streets. From this description it is easy to set down the distance from the zero station to the point at which the special car enters and leaves each individual color stretch, the greater of the two numbers being placed in the left-hand column and the lesser in the right-hand column. When the entire trip has been posted, the total in the left-hand column minus the total in the right-hand column gives the total mileage for the trip.

With this system it is possible to report to the traffic department before the close of each day's business the total number of trips, the mileage and the car-hours for the previous day on each run, on each line and on the entire system. The mail-car mileage, chartered car mileage, work-car mileage, and supply-car mileage are also computed. At the same time, there is given a list of all variations from the standard schedule, including the number of extra and short trips and the extra and short mileage.

Inspection Schedule Reduces Accidents

Specified Dates Each Month Used for Consideration of Certain Operating Points Reduced Number of Accidents in El Paso Remarkably in Two-Year Period

EARLY in 1923 the method of inspection of trainmen was changed radically by the El Paso Electric Railway, El Paso, Tex. The new plan was adopted as part of a campaign on the part of the company, under the leadership of Alba H. Warren, for the reduction of accidents. The campaign as a whole was described in considerable detail in ELECTRIC RAILWAY JOURNAL for Dec. 22, 1923, page 1047. Instead of having the inspectors make only general observations when watching the operators, they were requested to look for certain specified items on the various days of the month, according to the schedule shown in Table I. This schedule made it a requirement that particular attention be paid twice each month to each of the points listed, although of course the inspectors continually instruct the men in regard to all the requirements of the company.

TABLE I—MONTHLY SCHEDULE USED BY TRANSPORTATION DEPARTMENT INSPECTORS IN EL PASO, TEX.

Day of Month	Special Matter Under Investigation
1 and 16	Proper feeding.
2 and 17	Careful operation at railroad crossings and special trackwork.
3 and 18	Speed of cars, safety stops, junctions and slow signs.
4 and 19	Caution at "blind" corners.
5 and 20	Courtesy, personal neatness and cleanliness.
6 and 21	Car spacing.
7 and 22	Passing automobiles and care in traffic.
8 and 23	Gong ringing.
9 and 24	Reports, car defects, accidents.
10 and 25	Power consumption.
11 and 26	Warning signs to autoists and maintenance.
12 and 27	General inspection of overhead, slow signs, etc.
13 and 28	Railroad crossing signs or markers at danger points.
14 and 29	Signal lights, headway recorders and electric switches.
15 and 30	Condition of track and landings.
31	General review.

The result of the new method of inspection was that all the men were kept constantly on their toes to observe and to report anything that could improve the service or reduce accidents. By maintaining this system of bringing out the points which an operator should be observing at all times, the men were prevented from losing interest in their work.

The result has been a material improvement in the operation. That it has been a big factor in reducing accidents is shown by Table II, accidents having been reduced from 1,462 in the first ten months of 1921 to 495 for the corresponding 10 months of this year. The record is improving steadily, the best record being that for October of this year, with 34 accidents, as compared with 87 last year and 74 two years ago.

TABLE II—ACCIDENT RECORD BY MONTHS, 1921-1924, EL PASO ELECTRIC RAILWAY

	1921	1922	1923	1924
January	152	164	101	73
February	133	144	98	62
March	163	162	98	47
April	177	119	98	41
May	173	150	116	39
June	147	105	89	47
July	147	109	49	55
August	122	84	63	49
September	128	89	56	48
October	120	74	87	34
November	141	98	69	..
December	164	103	98	..

Comments on Report of Committee on Foreign Operation

MOUNT VERNON, N. Y., Dec. 1, 1924.

To the Editors:

It may seem rather late in the day for a discussion of some high lights in the report of the A.E.R.A. committee on foreign operation, but surely such discussion is warranted by the importance of the subject. The fact that this splendid report was the last feature of the last day of the 1924 convention was unfortunate. However, the publication of the report in itself has already proved of great value, notably with regard to the true status of the motor bus. Such a report was needed, for even its wide publication has not prevented repetition in the Detroit *Times* during November, 1924, of the well-worn fable that the bus has replaced the tramway in London!

The committee rightly stresses the difficulty of international exchange of good practices in full. Yet where there's a will, there's a way. We may reject the use of ticket inspectors to check over-riding, but we are accepting the differential fare principle of Europe just the same. San Diego is an early successful example; Public Service Railway, a later convert. On the other hand, although the manager of the Amsterdam Municipal Tramways was delighted with our safeties, he had no air compressors to permit electro-pneumatic control, but he did find a way to apply the same principles with electro-mechanical equipment.

The committee has done full justice to the fact that while the foreign tramcar is less comfortable and perhaps 10 per cent slower, it is cleaner, quieter, lighter and better maintained than our cars. Part of that quietness is due to a high standard of track upkeep. During a British visit directly after the war, almost every manager apologized for his track. Although I rode often on the upper decks of the cars, I certainly did not observe shocks, nosing or other defects severe enough to have elicited like apologies here.

FRANK TALK ON THE BUS

Those who read my studies on "The Place of the Bus" published during 1920 in the ELECTRIC RAILWAY JOURNAL will recall that the arguments for the coordinated use of bus and car were drawn almost entirely from British practice. American street railways then held bus operation in horror. But while the Britisher started first we have been moving so fast during the last two years that now he can learn from us in equipment, if not in applications. That is because we are both a richer and more hysterical people. The very railways that fought the bus most flopped the hardest once they were convinced.

The committee has used no gloves in handling the problem of buses for big-scale transport. Some extreme bus advocates may even feel a brass knuckle or two. Its outstanding statement is that "whatever street congestion there is . . . is caused almost entirely by motor buses and taxicabs."

It is a fine thing for the prospective rider to board a vehicle at the curb, but it does not speed up general vehicular movement if great, hulking double-deck buses are constantly cutting across the lines of faster automobile and truck traffic between the street center and the curb. If other traffic has no rights, why not build the car tracks alongside the curb?

The committee was told by Lord Ashfield, managing director of the Traffic Combine, that the present billion a year tram riders could be carried by buses "in the event that sufficient street space . . . were provided." He did not suggest that the motor bus should pay for said widening. On the other hand, the London County Council Tramways account in respect to "Cost of street improvements" shows that up to March 31, 1922, £809,295, or about $3,883,200, had been assessed against the street railway for such widening, exclusive of paving. Had the motor bus been saddled in this manner, there would have been little or no profit. Therefore, one of the big advantages of bus over tram in London is that it has enjoyed a subsidy out of the public funds via the street car rider.

The committee was impressed with the apparent recklessness of British riders in boarding or leaving cars and buses. Its comment that this nevertheless has not been reflected in damage claims is borne out by reports of these tramways for fiscal years ending in 1924: Bradford "accident insurance and compensations" account, 0.7 per cent of traffic revenue; same account Manchester, 0.6 per cent; Glasgow "third party accident" and "employers' liability" combined, 1.9 per cent. Glasgow's higher figure is due partly to its heavier traffic and possibly, also, to a provision that calls for trial of accident suits at Edinburgh.

With regard to the trackless trolley or "railless," the British have several special reasons for favoring it. First, the cost of energy is no higher if not lower than ours, but gasoline sells for 25 cents per American gallon against our range of 11 to 20 cents, with 15 cents preponderant; second, British cities operating tramways usually own the central station and don't want to lose trade; third, where the replacement of a trackway is concerned, it is much easier from a franchise viewpoint to replace with trackless trolley than seek motorbus rights from Parliament. For all that, motor buses far outnumber trackless trolleys, as here.

In discussing Bradford, the committee notes that nearby towns were unwilling to have Bradford routes extended their way, and it thinks that "this was a rather interesting sidelight on municipal ownership." This feeling has nothing to do with municipal ownership, but is simply the fear of the little communities that such extension of the big communities' utilities is the first step in their political annihilation. This handicap has been foreseen in Detroit by a provision in the state charter which permits the Department of Street Railways to operate for 10 miles beyond its boundaries.

LESS CONGESTION OF POPULATION IN LONDON

The committee is not quite correct in stating that London is uniformly built up to four or five stories. The greater part of London's housing consists of small houses for one, two or three families, but many downtown areas and sections alongside of the main highways seen by the chance visitor are of the apartment type. The facts are revealed by the statistics on population per acre. In 1920, inner London had 60 inhabitants and inner New York (Manhattan Borough) 123 inhabitants per acre. Greater London had only 17 per acre, while all New York had 28 per acre. The center of flat-fare New York is 125 per cent more densely settled than the center of zone-fare London, while New York as a whole is 65 per cent more densely settled than London.

The committee's adventures on the most heavily traveled city routes in the world led it to include that one-man operation is "virtually impossible" with zone fares. These are strong words when we consider that there are already in use a number of distance-fare routes in America and Europe with one-man cars or buses. It is true that many are light cross-country lines, but San Diego with two zones in the city and more on the suburban extensions has already advanced from one-man single-truck to one-man double-truck cars.

Again, of the 35 managers who answered a questionnaire of the International Street & Interurban Railway Association, 14 did consider operation of one-man cars practicable under zone fares and 12 more agreed it was all right for light lines anyway.

There are many two, three and more zone properties abroad where one-man operation will be feasible if the managements can find the money for automatic appliances, wider platforms, vestibules, fare boxes, ticket-issuing machines and other Americanisms, although it may never be possible to carry such operation to the same degree as under a single fare.

The mystery of "Why do the British keep double-decking?" brought no more satisfactory reply than that they have always done so. America used to double-deck in a small way in horse-car times, but today there are less than ten double-deckers in all. Continental Europe has practically discarded double-deck cars, yet Berlin and Vienna have double-deck buses. Paris, which had double-deck buses in horse days, has since standardized on single-deckers, although the bus is not yet capable of using a trailer to secure increase of unit capacity.

DOUBLE-DECK CARS LOSING CASTE

But at recent British conventions there have been rumblings against continuing the double-deck car, which necessarily must run at a lower schedule speed than single-deckers owing to greater standing time and high center of gravity. London no longer attaches single-deck trailers to double-deck motor cars because the County Council Tramways are out for greater speed through use of interpole motors and other improvements. Before the war, speed did not bother operators because there were almost no standing loads. Post-war conditions brought the 8-hour day, which piles up the peaks very sharply. No later than September, 1924, General Manager Wilkinson testified, in arguing against a cut in workmen's fares at Bradford, that 37 per cent of the total load was carried between 8 a.m. and 9 a.m. Formerly, the laborer was on the cars at 6 or 7 a.m. Now one of the most common fare petitions is for the privilege of having the workmen's half fares apply as late as 8 a.m. or 8:30 a.m. The committee's reference to the new Edinburgh cars is proof that this approach to American loading is bringing American ideas of passenger interchange, viz., separate doors for entrance and exit.

The committee may not have had the doubtful pleasure of riding the Paris solid-tire single-deck buses over the cobbled by-ways of that wonderful city. The Paris company may think pneumatics still an experiment, but the Michelin Tire Company is of another opinion. In a recent advertisement, headed, "Parisians—A Scandal," Michelin presents this deadly parallel: On the left, pigs ride softly to slaughter on pneumatic-tired trucks; on the right, the worthy fare-paying Parisians are being jounced on hard-tired buses.

With increased familiarity, the public is as critical of bus equipment as of the longer known trolley. It wants no slat seats in cars or hard tires under buses. The 15,000,000 soft-cushioned automobiles of America have set a high standard for vehicle comfort, no matter what the rate of fare.

As to gas-electric buses, it was my privilege to study in great detail the costs and operations of the Birmingham & Midland Motor Omnibus Company, which operates some 250 of these buses as standard. Comparison with the straight gasoline buses of other companies in the same syndicate did not disclose any marked economy in fuel and upkeep, but it was obvious that the gas-electric bus was easier to ride and far less noisy.

Supplementing the committee's notes on "Noise of Operation," be it noted that the Amsterdam and Malmö tramways have done something on their one-man cars worth copying the world over on any kind of car or bus. They have substituted passenger stop-lights for the noisy bell or irritating buzzer. How much more pleasant a ride would be if signal and register noises could be eliminated forever.

PROPORTIONS OF SHORT-HAUL RIDERS

Under the heading "Kinds and Rates of Fare" the committee notes that in Britain the one-zone riders tend to make up 35 to 50 per cent of the total traffic. It is not entirely correct to assume that "this reflects the closely built-up nature of most of the European cities" because like percentages occur in widespread cities like San Diego; Melbourne and Adelaide in Australia and Christchurch, New Zealand.

In San Diego, with only 2.5 inhabitants per acre of all its area and but 13 per acre on built-up ground, the number of one-zone and two-zone riders is almost exactly the same. In this case, the inner zone rider averages 1.3 miles per ride and the outer zone rider about 3 miles.

At Melbourne the cable system operating in the older section carried only 31 per cent at the minimum fare of 1.5d., whereas the electric system operating in the suburban areas carried 47 per cent at the minimum fare during the year ended June 30, 1923. Although Adelaide fares go to 12d., the average of 2.5d. indicates a very high ratio of short-haul riders. The Christchurch report for the year ended March 31, 1923, shows that more than 60 per cent of the traffic was at the minimum adult fare of 2d. or 4 cents.

These figures show that the proportions of rides at different rates of fare are affected just as much by the scale adopted as by the distribution of population. Through juggling the rates you can get anything you want.

Since the committee's table showing average bus and tram rides for given fares had to omit the London bus, it is worth adding that London bus fares vary by 30 per cent just according to the presence or absence of tramway competition, and that they include no workmen's rates. As the buses have a much higher seat-use factor than the trams, they naturally do not favor any off-peak reductions such as the "tuppeny all-the-way" concession of the London County Council Tramways. The gains from this concession, as mentioned in the report, refer of course only to the tramway business of the mid-day hours. In the fiscal year ended March 31, 1924, 28 per cent of the passengers rode at mid-day rates and 13.75 per cent at workmen's rates.

The British zone fare is found in many varieties. Glasgow and Leeds tend to work toward the same average length of ride for each increment in fare. Manchester seeks to give the longest possible ride for the minimum fare figuring from the downtown center. The London Underground fares, like American steam railroad commutation, give more and more per penny the farther one rides. No one dreams of rigidly interpreting the legal limits of 1.5d. or 2d. per mile. These may be the average rates per mile, but the stages themselves are never laid out in geographical miles. They are laid out chiefly according to traffic intersections and may vary greatly not only on the system as a whole, but on individual portions of the same route.

In connection with fares, the report remarks briefly that the actual wages in Europe generally are but one-third to one-half of ours. The state of the continental coinages makes a comparison impossible for all European countries except Britain. As regards Britain, it would be more correct to say one-half to two-thirds. The comparison cannot be made on the basis of hourly rates or even weekly earnings because the men receive uniforms and overcoats free, vacations with pay for a week or more, longer time allowances, higher overtime rates, etc. It is true that British platform men do not live so well as ours, but this is also due in part to the fact that luxuries cost more, whether movies or flivvers. The platform man's standard week is 6 days, totaling 48 hours.

The committee correctly assumes that there is loss from over-riding under the zone fare prevalent abroad. There is also a loss due to the fact that a passenger on a loaded double-decker may have already ridden a stage before the conductor gets around to him. However, these losses are not inherent to the zone-fare system. If the passenger had to give up his receipt upon departure instead of throwing it away where he pleased, there would be no more over-riding than on our own distance-fare routes. The use of closed prepayment areas or of street collectors at heavy boarding points would also minimize the second kind of loss mentioned. One of the crying needs of the busy British tramway has been a car that will permit entrance on one platform and exit on the other. The double-deck design is largely to blame because the stairways leave so little room on the platforms.

THE WEEKLY PASS AT HULL AND BRADFORD

Last, but not least to me, is the final paragraph in the report giving some of the experiences with the weekly pass at Bradford, also used at Doncaster and Hull. There is some humor in the fact that the weekly pass, derived from the foreign season ticket, should return to its home clothed with transferability and a 7-day period instead of 3 months or so. When A. H. Wilkinson, general manager, requested counsel in the matter, I suggested the pass as a means of speeding up fare collection and of putting off the then threatened reduction of the base fare from 1.5d. to 1d. If it did not make money, you will observe that the report states it has been saving money at the rate of £95,000 a year. It was not expected that the pass would have much sale among workmen because the latter get a lower rate anyway and have less money for off-peak diversion, but the sales actually have been much higher than I expected because some of the better-paid riders have given up their workmen's rates in favor of the pass.

WALTER JACKSON.

Association News & Discussions

Features of Second Convention of Central European Street Railways

At the September Meeting of the International Street and Interurban Railway Association Many Features of Equipment and Track Design, Maintenance Methods, Fares and Employment Problems Are Discussed

THE second convention of the Internationaler Strassenbahn und Kleinbahn Verein (International Street and Interurban Railway Association) opened at Homburg von der Höhe on Sept. 3-5, 1924. This organization of central and northern European electric railways was founded in 1920 at Nürnberg and its first big meeting was held in Vienna in 1921. In opening the 1924 sessions, President Ludwig Spängler, general manager Vienna Municipal Tramways, noted that the 1923 meeting scheduled for Budapest had been postponed because of the continuance of unsettled economic conditions. He was sure that the participation of 330 delegates and 100 women visitors presaged better times. The association has now more than 400 members.

A paper on one-man cars was presented by Messrs. van Putten and Hultman, respectively general managers of the Amsterdam and Malmö systems. This was abstracted in this paper for Nov. 28, page 926. In Europe, the dominant desire for such cars was saving in labor cost by bringing wages to say 36 per cent of the revenue or 41 per cent of the operating expenses. Twenty-five systems were operating one-man cars and 14 more contemplated doing so.

General Manager Geiser of the Schaffhausen Tramways discussed the growing competition due to cross-country automotive lines. In 1907, Switzerland had only 3,837 motor vehicles; now there were 40,116. Regulation of this rapidly growing means of transport was certainly in order. The Swiss railways have therefore demanded of the government that (1) railway regulation should be moderated; (2) special rebates for mail carriage should be eliminated; (3) tariff on rails and special work should be removed; (4) taxes should be imposed on automotive transport to pay for their use of the highways; (5) general service and tariff regulations covering automotive transport, including restricting the over-all weight of vehicle to 5 metric tons (11,020 lb.) should be enacted. The speaker recommended that the railways take up and co-ordinate motor transport with rail transport.

General Manager Norregaard, Copenhagen, followed with his paper on the efficiency of transportation personnel as judged by mileage output, placing stress on the need for separating city and cross-country roads in making comparisons of relative net speeds, etc. This was abstracted in the issue of this paper for Nov. 1, page 775.

Alexander Patz, acting general manager Budapest Tramways, then discussed methods for securing better spacing of cars; and also means for judging the relative efficiency of the different depots from both transportation and maintenance viewpoints. (See ELECTRIC RAILWAY JOURNAL for Nov. 15, page 856.)

ANTI-FRICTION BEARINGS—TRACK

Two papers were to have been presented on anti-friction bearings. Dr. Vidéky, Budapest, based his paper largely upon a discussion of design, classification and material. However, General Manager Pforte of the Hagen Tramways refrained from presenting replies to the questionnaire for discussion because the answers had been given for the postponed congress of 1923 and they therefore no longer gave a fair picture of progress. (Abstracted in the issue of this paper for Nov. 1, page 774.) General Manager Hubrich, Essen Tramways, who spoke for Mr. Pforte, stressed the importance of more exact tests, such as having different cars run to their coasting limit with and without anti-friction bearings—aside from the use of watt-hour meters. It was resolved to continue the questionnaire as a feature for the next convention.

Chief Way Engineer Goetz, Leipzig, followed with his paper on track and its upkeep. (Abstracted in the issue for Nov. 15, page 854.) At his suggestion the meeting adopted resolutions calling for fewer curves with longer radii, for preferential specification of standard rail sections and for the elimination of concrete sub-structure in favor of well-drained broken stone foundations accompanied by welding of all joints.

General Manager Hausmann, Coblenz, presented an interim paper on standardization of grooved rails in three classes, viz.:

DIMENSIONS OF PROPOSED STANDARD RAILS FOR CENTRAL EUROPEAN TRAMWAYS

Section Number	1	2	3
Height, mm.	180	180	160
Base, mm.	180	160	160
Tread, mm.	56	50	48
Width of groove, mm.:			
Tangent track	31	31	31
In curves	34	34	34

The standardization study is to be continued by the Technical Commission of the Verbandes schweizerischer Secundärbahnen (Swiss Secondary Railways Association), of which Dr. Zehnder, general manager Montreux-Oberland Railway, is chairman.

MAGNETIC BRAKES—POWER-CHECKING PLANS—SELF-VENTILATED MOTORS

The second business session, held on Sept. 5, opened with the paper on magnetic brakes by General Manager Barth, Christiania (issue of Nov. 15, page 855). He was followed by General Manager Pforr of Berlin, who discussed current saving without the use of checking devices (issue of Nov. 1, page 776).

The paper on self-ventilated motors by Mr. Nier, engineer of the Dresden system (abstracted in the issue of Nov. 15, page 854) was discussed by Dr. Zehnder of Montreux, Switzerland. Ventilated motors had made good on his line, which is 76 km. (47.1 miles) long, meter gage (39.37 in.) and in difficult country. On other narrow-gage lines there were difficulties in drawing air directly from the trackway, so that car-body or roof intakes were preferable in such cases. The temperature difference of ventilated and closed motors increased with the increase in stop spacing. With stops only 180 m. (590 ft.) apart, there was no difference, while for long runs the difference might be in the ratio 2: 3.

Mr. Paap, retired government engineering councilor, Berlin, then gave a talk on couplings.

August Winter, executive staff Vienna Municipal Tramways, in presenting his paper on fares in municipal areas (issue of Nov. 29, page 924), observed that the proportion of weekly wages which a workman paid for a single fare, averaged as follows:

Scandinavia	0.0020 to 0.0025
Holland	0.0024 to 0.0029
Switzerland	0.0015 to 0.0023
Austro-Hungarian succession states	0.0030 to 0.0038

The total annual expenditure for carfare may reach a sum equivalent to four weeks' wages.

The meeting closed with a demonstration lecture on wireless telephony and radio by Prof. Leithäuser, Berlin, and the possibilities it offered in railway service for communication with moving vehicles, using rails, wire and vehicles as part of the transmission system.

NEXT MEETING AT BUDAPEST

The association decided to hold its next convention at Budapest in June, 1925.

At a suggestion made by General Manager Ruijs, Enschede, it was planned to ask the Union Internationale de Tramways, de Chemins de fer d'Interêt local et de Transports Publics Automobiles to use its good offices to intercede for German street railway managers who had been exiled in the course of the military occupation.

Tramway Men Attend Colorado Utilities Convention

About 100 delegates, including many electric railway men, from Colorado, Wyoming and New Mexico, attended the second annual mid-winter conference of the Colorado Public Service Association and the Rocky Mountain Division of the National Electric Light Association held in Denver on Dec. 18.

E. A. West, general superintendent and chief engineer Denver Tramway, who was one of the principal speakers, pointed out that in regulating the traffic on the streets of the cities, insufficient attention is given to the tramway, whereas it should be one of the principal things to consider when planning new regulations.

A.E.S.C. to Hold Conference on Line Materials

A conference has been called by the American Engineering Standards Committee as the result of proposals for the standardization of overhead line materials made by the American Electric Railway Association. This will be held at the Engineering Societies Building, New York City, on Jan. 13, 1925, beginning at 10 a.m. The purpose of the conference is to determine whether the unification and extension of specifications for overhead line material, such as pole line hardware, cross-arms and pins and strain insulators shall be undertaken.

At the conference the present situation in regard to specifications for overhead line material and the suggestion of general policies as a basis of discussion will be presented by M. B. Rosevear. The question will be taken up as to whether there are any overhead line materials for which specifications should be unified, and if so, whether it is desirable that the unification shall for the present be limited to materials used by two or more branches of industry or whether specialized materials for specialized industries should be included. The inclusion of materials and dimensional data, and nomenclature will also be discussed.

Work on the following subjects is already in the hands of representative sectional committees under A.E.S.C. procedure: Wood poles; tubular steel poles; conductors; insulated wires and cables; annealed, medium and hard-drawn copper wire; zinc coating of iron and steel.

Kentucky Utility Meeting

The annual meeting of the Kentucky Association of Public Utilities will be held at Louisville, Jan. 15 and 16, 1925. About 300 public utility executives from Kentucky and surrounding states are expected at the meeting.

Convention rates of one and one-half times regular one-way fare have been arranged for by the Southeastern Passenger Association and the Central Passenger Association. These rates apply on all tickets costing 67 cents or more one way. The selling dates are Jan. 12 to 16 inclusive, and the last honoring date, Jan. 20.

American Association News

Subjects and Meetings

The committee on subjects and meetings met in New York Dec. 19 for the purpose of more definitely drawing up the program for the Midyear Meeting of the association to be held in Washington on Feb. 17. As tentatively outlined, in addition to certain outstanding speakers, the program during a portion of both the morning and afternoon sessions is to take the character of an old fashioned "town meeting." In the morning the discussion will be somewhat in the nature of checking up of the electric railway business with comments from the point of view of the manufacturer, car rider and railway. In the afternoon the subject of when, where and how to use buses will be discussed from the point of view of manufacturers and railways. The committee also determined upon the speakers to be invited for the two business sessions and the banquet in the evening.

Members of the committee present were Chairman W. H. Sawyer, H. D. Briggs, Harry L. Brown, Charles H. Clark, F. W. Doolittle, C. R. Ellicott, C. W. Kellogg, E. F. Wickwire and J. H. Hanna.

Maintenance of Equipment

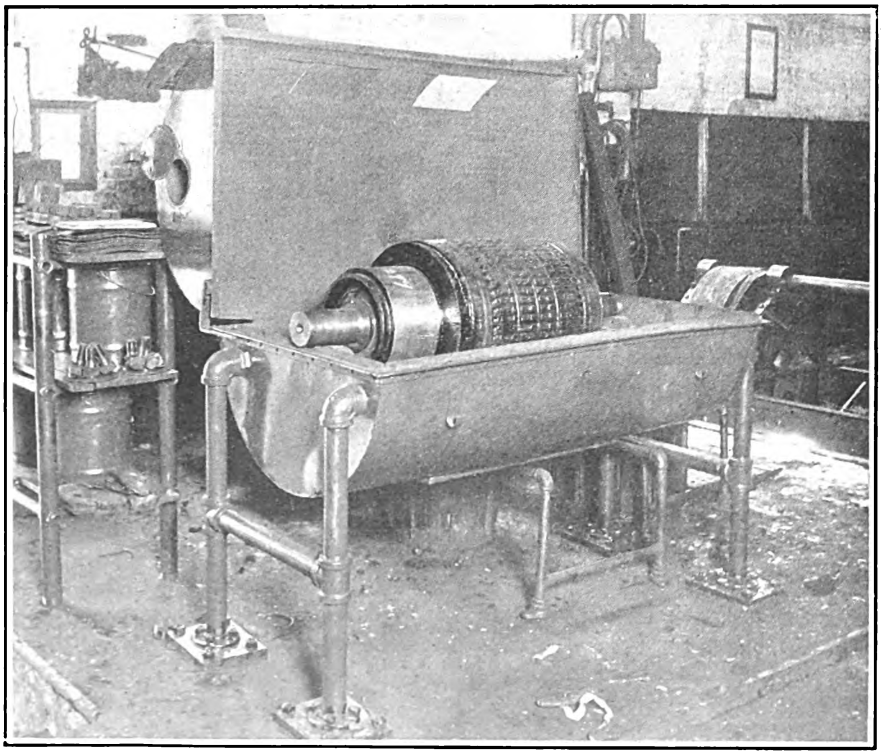
Efficient Method of Cleaning Armatures

THE usual method of removing loose dirt and dust from armatures when they are removed for overhauling is to direct a spray of compressed air on the equipment. To blow off the dirt efficiently, and at the same time to prevent dust from flying off during the process, inconveniencing adjacent workmen, the equipment shown in the accompanying illustration is used in the 39th Street shops of the New York Rapid Transit Corporation, Brooklyn, N. Y. It consists of a sheet-steel drum whose upper section is hinged so as to permit the insertion of the armature. The armature is supported on two sets of rollers, so that it can be rotated easily. The end brackets are arranged so that the weight of the armature is carried directly by the 1½-in. pipe framework on which the drum is mounted.

With an armature in position the top is closed down and compressed air is turned on through two pipes passing into the bottom of the drum. At the back of the lower section is a 4-in. exhaust pipe. An exhaust blower in this line draws off the dust as it is blown from the armature and the dirt is carried to a receptacle on the outside of the shop. The armature can be rotated by a workman inserting his hand through a hand hole in the end of the upper section of the drum. By the use of this equipment armatures are cleaned efficiently and all dirt is confined so that it does not fly off in the shop and interfere with other work.

Fiber Covered Rods for Brush Holders

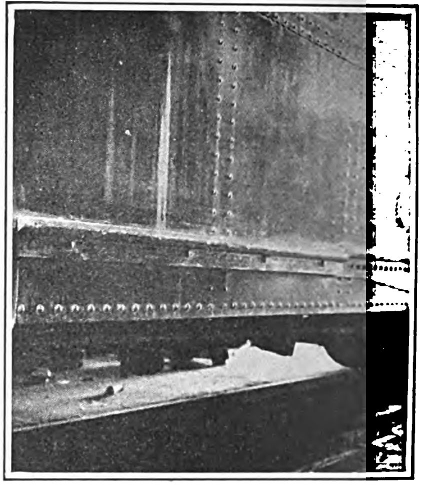
AS THE result of trouble which had been experienced with metallic bracket arms on brush holders, the Eastern Massachusetts Street Railway is replacing these parts with fiber-covered metal rods. The appearance of the modified brush holder is substantially the same as before, as is shown in the accompanying illustration. It has been the experience of the railway since undertaking this change that there have been fewer short circuits. Ordinary fiber tubing is used to cover the metal rod.



This Cleaning Drum for Armatures Has a Suction Attachment for Removing the Dirt

Counteracting Corrosive Effect of Acids

DIFFICULTY has been experienced by the Boston Elevated Railway on account of damage to the exterior paint of its new rapid transit cars operated through the East Boston Tunnel. This tunnel was built many years ago and has always been somewhat leaky. Salt water seeps through and drops down on the roofs of the cars. From there it runs down the sides, checking the varnish, eating the paint, and corroding the metal. The nature of the defacement caused in this way is shown in an accompanying illustration. The company is using Wilson's Imperial Paint Restorer to counteract the corrosive effect of the salt water.



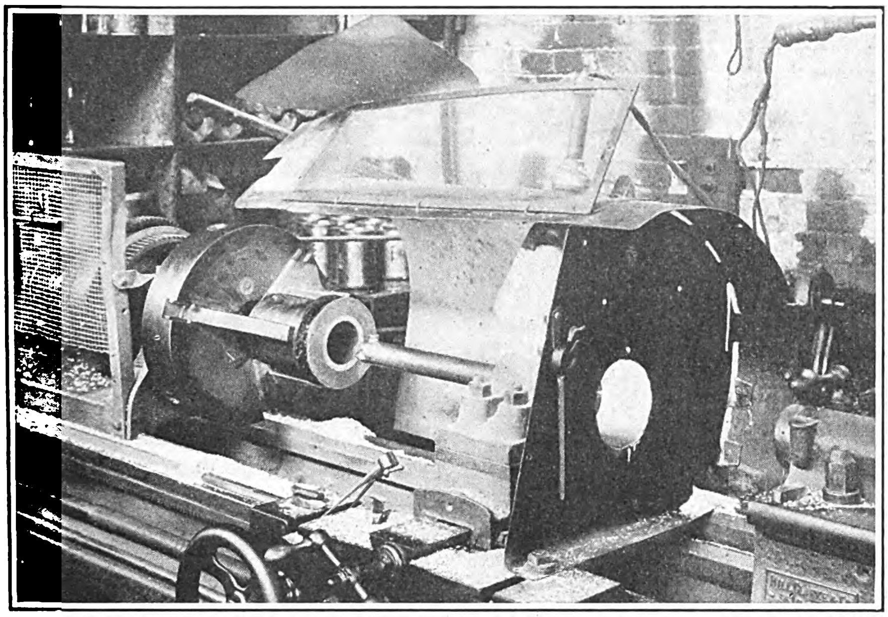
Defacement of East Boston Tunnel Cars Caused by Salt Water Dropping on Roof and Running Down the Side

Self-Centering Chuck Facilitates Bearing Machining

BY W. L. BRIAR

Foreman Kansas City Railways

IN THE shops of the Kansas City Railways bearings are bored in a self-centering chuck having special long jaws that grip the bearing securely and hold it firmly in place during the operation. This chuck is manufactured by the Union Manufacturing Company and is known as No. 153 Class D.



A Special Long Jaw Type of Self-Centering Chuck Facilitates the Work of Machining and Boring Bearings. Complete Protection to Workmen Is Afforded by the Almost Totally Inclosed Housing that Is Set Up Around the Work

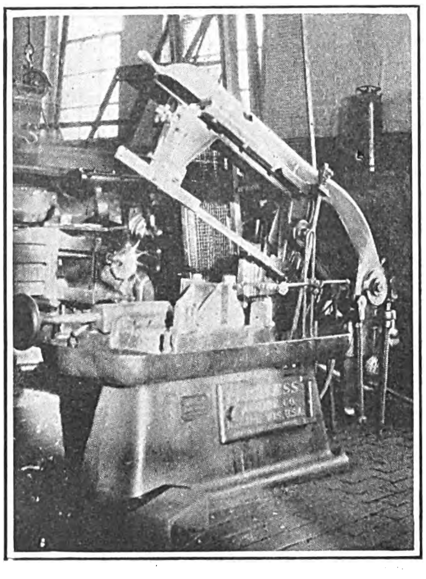
Although the bearing turning and boring operations are usually carried out in a large Gisholt lathe, the work may also be done efficiently in an ordinary engine lathe with the set-up shown in the accompanying illustration. In this case the boring bar is held in a special clamp on the tool post, and is readily fed into the work. For boring babbitted bearings to final size for fitting to worn shafts, this set-up is particularly useful since it avoids tying up the Gisholt lathe for this work.

Another interesting feature of the bearing finishing work as it is carried out in the Kansas City shop is the complete guard that is built around the work, for the purpose of conserving scrap brass and babbit and also to protect the operator and adjacent workman from flying bits of brass. It will be noted that a hinged brass shield on the front of the guard is arranged so that it can be lowered into a position that completely protects the workman's eyes, and at the same time allows him clearly to see the work in progress. An additional flexible flap on the bottom of the shield helps to confine the scrap brass to the pan provided for its collection.

High-Speed Saw Makes Saving

A SHORT time ago the Altoona & Logan Valley Electric Railway, Altoona, Pa., replaced its old power-driven hacksaw by a Peerless high-speed saw. This change in the shop equipment has effected important savings in two ways. A great deal of time has been saved, and the labor cost thereby much reduced. It now takes only 15 minutes to cut a 5-in. axle instead of 2½ hours, which was required formerly. Moreover, the number of blades required has been much diminished. Whereas it used to require four or five blades to cut an axle, now one blade will do several jobs of this kind.

In addition to the ordinary work of the mechanical department, rails are cut for the track department. The greater speed of operation of the new saw has saved money for the company by eliminating much of the waiting time of track men while this work is being done.



This Saw Does a Job in 15 Minutes that Formerly Required 2½ Hours

New Equipment Available

Electric Hoist

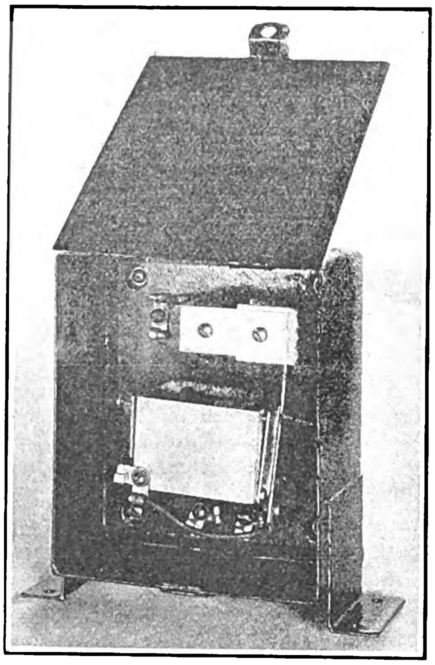
A NEW electric hoist designated as type R and available in capacities from 500 lb. to 4,000 lb. has been recently added to the line of the Roeper Crane & Hoist Works, Inc., Reading, Pa. The hoist is worm geared, the worm being placed above the gear to reduce wear. The worm shaft is equipped with end-thrust ball bearings. The motor is mounted directly upon an extension of the hoist frame. This is a one-piece casting that contains all bearings so that shaft and moving parts are kept in alignment. An automatic stop provides top and bottom limits. Controllers are of the single-speed drum type, although push-button control can also be furnished. The moving parts of the hoist are entirely inclosed and operate in a bath of heavy grease or oil.

Improvements in Signal Light System

THE signal light system, as ordinarily used by electric railways, provides a visible indication for the motorman or operator to show when all doors are closed. Additional features incorporated provide that the doors cannot be opened until the car is stopped and that the car cannot be started until the doors are fully closed. A number of improvements in the various detail parts which constitute the signal light system have been made recently by the Consolidated Car Heating Company, Albany, N. Y.

The latest door switch, Type 397, which breaks and completes the signal light circuit as the doors open and close, has contacts thrown in or out by a toggle mechanism. The brass rollers now used for the movable contacts provide a wiping action as the contact is made, which eliminates trouble due to dirt or dust. A bakelite insulated base supports the movable contacts. The rear of this base is provided with two recesses for the springs which hold the switch in one or the other of its two positions. The contact studs are also imbedded in a bakelite base.

Where the control is interlocked with the doors in addition to provid-



The Type 700 Control Relay Has Magnet Coil in Series with Signal Light Equipment

ing a door closing signal, the Type 398 door switch is used. This has double sets of contacts, one set for the signal light circuit and the other for the interlocking control circuit. This type of switch is also used for making contact where variable load brake equipment is used. The box which houses the mechanism is of cast iron, about 4 in. square, and has a sheet metal cover. Contact is made by means of a copper disk with molded insulation on either side. The plunger which operates the contact disk has two springs, one for holding it out and the second for providing pressure on the disk. The new form of contact base is of bakelite canvas, with brass contacts. This type of switch can be arranged for operation either by the door itself or by the arm of the door engine.

The new motorman's starting signal light is smaller and neater than the previous design. It has a condulet mounting and a porcelain base for the lamps and contacts. As in the older type, two signal lamps are connected in parallel, but a resistance is in series with one of them, which prevents the lamp with which it is in circuit from lighting normally. When the right hand lamp fails the one at the left lights automatically without the mechanical action of any moving parts. When the burned out lamp is replaced it again gives the signal light as before. The resistor is mounted surrounding the porcelain base of the spare lamp, making the unit very neat and compact. Bayonet type lamps are used, as it has been found that these do not work loose through vibration.

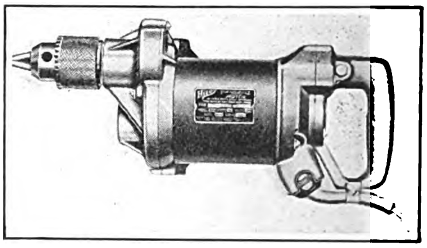
Some improvements have also been made in the Type 700 control relay, the magnet coil of which is connected in series with the signal light equipment. Compression springs are now used to open the circuit when the coil is de-energized. When all doors are closed, the magnet coil is energized and the relay contacts are closed. These contacts being in series with the magnet coil of the main line switch or contactors in the control circuit the car cannot be started until all doors are closed.

Elevating Platform Truck

AN ELEVATING platform truck which has a height of 17½ in. from the floor when the platform is down and 22 in. when the platform is raised has been placed on the market by the Crescent Truck Company, Lebanon, Pa. The rear wheels have a diameter of 15 in., which gives 6 in. clearance underneath the platform. All the tires are 5 in. wide and the truck has been designed throughout for heavy service, with a lifting capacity of 6,000 lb. The wheels are equipped with Timken roller bearings, the driving unit is carried on SKF ball bearings, the controller is built by the Cutler-Hammer Manufacturing Company and the motors are of General Electric manufacture. All working parts are accessible and readily adjustable. The loading platform is 70 in. long and 26 in. wide.

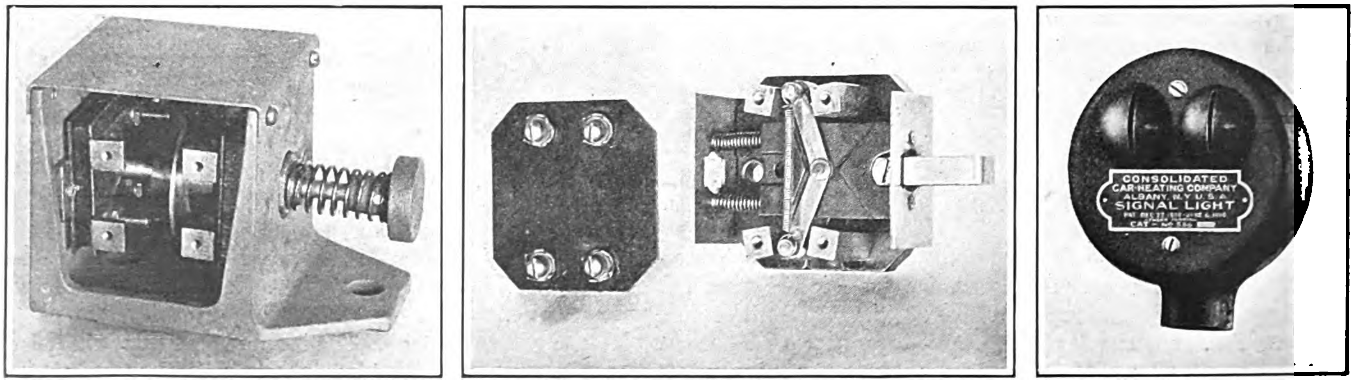
Low Speed Electric Hand Drill

THERE are some materials, including slate and marble, which can only be drilled at a very low speed. To provide for this class of work the Hisey-Wolf Machine Company, Cincinnati, Ohio, has recently brought out a low speed electric drill. This operates at a no-load speed of 110 r.p.m. and has sufficient power for drilling holes up to ½ in. diameter. This drill is equipped with a universal motor which can be operated on either alternating or direct current. Ball bearings are provided throughout. A new feature is a quick cable connector, which permits cable repairs and renewals without dismantling the machine.



An Electric Drill that Runs at 110 R.P.M.

For drilling slate and marble the manufacturers recommend ordinary carbon steel twist drill ground with a straight chisel face. A drill ground straight across with the cutting edge at right angles with the sides will bore true to size. By grinding the cutting edge on a slant the drilling size of any bit can be increased, depending on the slant or angle at which it is ground.



Improved Apparatus for Car Signal Circuits

At left, Type 398 switch interlocks control with doors in addition to signal lights.

In center, switch used for door control of signal lights.

At right, signal light to indicate to motorman when all doors are closed.

The News of the Industry

Mayor Hylan a Witness

Presiding Justice Has to Remind Auditors that Hearing Is Not a Show —Delaney Questioned

Mayor Hylan was the star witness of the week at the transit inquiry being conducted in New York as a result of charges filed with the Governor by the Mayor himself. A statement had been prepared by the Mayor in advance, but he was refused permission to read it. The statement, published in full by some of the newspapers, ran to the extent of a full newspaper page. Justice McAvoy said it could not go into the record unless presented under oath, but he would give the Mayor's brief consideration when he came to write his report.

Counsel for Justice McAvoy, who is to the subject of the questions. Most of the time the spectators were tittering. There were frequent raps of the gavel to restore order. At one point Justice McAvoy said:

> This is not a show, gentlemen. It is an endeavor to find out what the trouble is with the various situations confronting the transit authorities.

Here are some samples of the Hylan sallies:

> You don't have to be a transit engineer to have just ordinary common sense.
>
> I wouldn't take up anything with McAneny (chairman of the New York Transit Commission). Not on your life. I don't trust him.
>
> I have ridden on the subways and the elevated lines, and for many years I was a locomotive engineer and know something about service.
>
> I am not going to let you lead me into a trap.
>
> I am not an investigator. I am just endowed with ordinary common sense that God Almighty gave me. We are entitled to better service on the existing lines and until the end of my office I am going to fight for better service.
>
> I am made the defendant instead of the prosecuting witness.

Mr. Sherman finally brought from the Mayor that the city's position regarding improvements in service had been presented to the commission "in a general way."

Mr. Sherman persisted in asking whether the Mayor had consulted any engineer in regard to how service might be improved and the Mayor finally said he had consulted Frank J. Sinnott, secretary of the Board of Transportation and brother of the Mayor's secretary and son-in-law, John F. Sinnott. The Mayor presented a memorandum, prepared by Mr. Sinnott, as to how service on existing lines might be increased.

Examination of the Mayor showed that this memorandum had been prepared very recently. The Mayor declared that he had done everything he could think of to compel "McAneny and the State Transit Commission" to give better service on the existing lines.

Certainly the hearing was productive of little that was constructive. The Mayor's brief, however, made plain the fact that he stands for these things:

> Construction of new independent subway system to be operated at a 5-cent fare.
>
> Establishment of an adequate motor bus service.
>
> Proper service on existing subway, elevated and surface lines.
>
> Advocacy of passage by Legislature of proposed constitutional amendment to exempt from the city's debt limit the $275,000,000 expended in the original subway as self-sustaining, and use of the credit that might be thus released in the future to borrow money to help pay the cost of the proposed independent subway system.
>
> No connection of new subways with either the present B.-M. T. or Interborough system, and no perpetuation in that way of what the Mayor calls "a bad business bargain for the city" in the dual subway contracts.
>
> Condemnation of and promise of continued opposition to the Transit Commission's plan for the reorganization of the transit companies of the city into a unified system, which the Mayor characterizes as "a scheme to loot the public" by making the riding public pay for lines "about to be scrapped."

The two previous days John H. Delaney, chairman of the Board of Transportation and Mayor Hylan's chief adviser in transit matters, was on the stand. Mr. Sherman's questions were directed particularly toward bringing out the salient points of the connection of Mr. Delaney with transit matters, first as transit construction commissioner, later as adviser to Mayor Hylan and more recently as head of the city Board of Transportation under the Mayor. Mr. Delaney simply would not permit himself to be jockeyed into a position of criticism with respect to saying anything that might be interpreted as a direct reflection upon the Mayor. He said:

> The Mayor makes so many statements I can't keep track of them all. Please do not ask me to comment on the Mayor's action. He was free to do as he chose, and as he is able to speak for himself, I do not want to criticise any one.

Bitter Words Over Cleveland Bus Proposal

Ohio Commission Hears Objections to and Arguments for Bus Lines to Compete With Cleveland Railway—Expert for Bus Applicant Severely Grilled—Manufacturer Denies Connection With Applicants

HEARINGS have been conducted during the last two weeks before the Ohio State Public Utilities Commission at Columbus on the application of the People's Motor Bus Corporation, Cleveland, for a certificate of convenience and necessity to operate buses in Cleveland. The application was opposed by representatives of the city of Cleveland, the Cleveland Railway, the Cleveland Chamber of Commerce and other civic and commercial organizations. All these interests took the position that if buses are to be operated in Cleveland they should be run by the Cleveland Railway. The Clevelanders also contend that under the home rule provision of the state constitution the right to grant permission for bus operation in Cleveland lies with the City Council rather than the State Utilities Commission.

Two years ago, however, the State Legislature passed the so-called Collister-Freeman law, which gives the State Utilities Commission control over bus applications. The commission contends that under this act it has the right to grant permission to bus operators in Cleveland. Cases now pending in the State Supreme Court, however, may determine whether the state commissions or city councils have the right to control bus operation within municipalities.

Representatives of the city, including City Manager W. R. Hopkins, Mayor Clayton C. Townes and members of the utilities committee of the City Council, are attending the hearings in Columbus opposing the application of the People's Motor Bus Corporation. They claim that if a company other than the Cleveland Railway is allowed to operate buses in Cleveland, it will mean financial ruin for the Cleveland Railway.

Joseph L. Rhinock, Cincinnati, and E. F. Sims, St. Louis, are the principal backers of the People's Motor Bus Corporation. They were represented at the hearings by Attorneys John Campbell, Cincinnati, and R. W. Sanborn, Cleveland. Messrs. Rhinock and Sims were also the backers of the People's Motor Bus Company, St. Louis.

Henry M. Brinckerhoff, New York, appeared as an expert witness for the Cleveland People's Motor Bus Corporation. He was subjected to a severe cross-examination by Attorneys Harry J. Crawford and City Councilman Fielder Sanders, former city street railway commissioner.

The Cleveland *Plain Dealer's* staff correspondent, W. M. Tugman, tells of this cross-examination partially this way:

> Challenging the reliability of the engineer, Mr. Crawford defied him, in the light of past statements recommending unified management and control of urban transportation facilities, to answer this question:
>
> "Is there any public convenience to be served by the granting of a license for bus operation in Cleveland to the Cleveland People's Motor Bus Corporation?"
>
> Opposing counsel objected, and the commissioners ruled that this question as stated was one which they would answer in their own way in due time. Mr. Crawford made the question the general one of a permit to any competing company.
>
> "I want the answer, 'Yes or No.'" he said.

"Object! Object!"

The commission ruled the witness should answer in his own way.

"You have two questions," said Mr. Brinckerhoff. "I have said I believe buses would supply a convenience the street railways do not now supply. The rest is a matter for the city and this commission to determine."

There was turmoil as Mr. Crawford demanded the answer be stricken out.

"Should a license be granted to any competing company? I don't care to whom. I want your opinion, as the expert of the $36,000 report."

"On which we made nothing," retorted Mr. Brinckerhoff.

"Perhaps it was worth nothing."

Followed a bitter argument in which Mr. Crawford pleaded with the commission to compel Mr. Brinckerhoff to give him a specific answer.

"This man doesn't dare to answer my question," said Mr. Crawford. "In view of his reports he's got to say that two competing systems would be ruinous. He's got to admit that if we let this concern in we sooner or later will have to buy them out at 100 per cent profit."

The commissioners said they didn't think the witness should be unnecessarily embarrassed. Mr. Crawford said he thought the importance of the situation demanded a stretch of the usual decorum.

"If this man says 'yes,'" shouted Mr. Crawford, "I'll hang him on his own reports. If he says 'no' he ruins his previous testimony. I don't care which he does, but I do want to know how far he'll stultify himself because his credibility is in question."

"Overruled."

Mr. Crawford went back to his questions from Mr. Brinckerhoff's past recommendations on unification of service and reshaped his question to read:

"Do you know of any reason why buses should not also be included in unification of service which you say you still advocate for rail systems?"

Again and again and again he thundered the question in a dozen different forms, the witness declaring that a multitude of circumstances made positive expressions impossible.

"Let's turn back to the high-priced report," said Mr. Crawford. "In 1919 you said: 'Unification of all transportation systems cannot be too strongly urged.' Do you stand by that now?"

"Yes."

"Do you know any reasons why bus operations should be excluded from that recommendation?"

"No."

YELLOW COACH MAKES STATEMENT

It has been talked around Cleveland that the Yellow Coach Manufacturing Company was behind the People's Motor Bus Corporation. This was denied in a telegram to J. J. Stanley, president Cleveland Railway, by John Hertz, chairman of the board of the Yellow Coach Manufacturing Company, Chicago, as follows:

> I should like to have the Public Service Commission of Ohio, the city authorities, the press, the citizens of Cleveland and your good self and associates understand that neither I personally nor anyone associated with me in the various enterprises which I have the honor to represent is in any manner morally or financially identified with or interested in the activities of Messrs. Rhinock and Simms in their present efforts in Cleveland to procure the necessary legal rights for the installation of a motor coach service. On the contrary, we are wholly out of sympathy with what they are attempting to do there and I sincerely regret and resent the inference which apparently they permitted to get abroad without emphatic denial that we were associated with them in this undertaking. This applies not only to Cleveland, but to their activities in Toledo and any other city in America where they may be engaged in similar undertakings. Messrs. Rhinock and Simms are minority stockholders in the People's Motor Bus Company, St. Louis, the management of which recently came under our control. Other than this I have not now or have I ever had any business dealings or business interests in common with either Mr. Rhinock or Mr. Simms.

It was announced on Dec. 24 that the State Public Utilities Commission has continued until Feb. 11 further hearings on the bus applications of both the People's Motor Bus Company and the Cleveland Railway.

Survey of Transportation to Be Made at Yale

An extended study of the transportation problem in its engineering and economic aspects is to be conducted at Yale, beginning early next year. Official announcement to this effect was made on Dec. 5. The purpose is to determine what program of graduate studies in transportation at Yale is best adapted to the needs of the country and to the personnel and facilities at the university's command. The instruction and research done by other universities and technical schools will also be examined. The survey will be under the direction of Winthrop M. Daniels, professor of transportation; Charles J. Tilden, professor of engineering mechanics, and Samuel W. Dudley, professor of mechanical engineering.

The announcement also said that there will be regularly five Strathcona fellows in transportation at a stipend of $1,000 each, whose appointment is made possible by the fund received by the university in 1914 under the will of Lord Strathcona and Mount Royal. From this fund, which has already provided for two professorships, the Yale Corporation has also established two undergraduate scholarships, each of $600, payable to students showing efficiency and promise in the economic or engineering phases of transportation.

All branches of transportation, on water, land and air, will be considered in this survey, and special attention will be given to the study of their relationship and possibilities of their correlation.

Strike and One-Man Car Suit Are Problems in Dayton

The six street railways of Dayton face a complex situation at present. Five of them are encumbered by litigation arising from the ordinance against the one-man car passed at the referendum election in November, 1923. The status of the litigation is indeterminate as regards the continuance of the injunction in force at present against enforcement of the ordinance, but it will probably be dragged out for some time no matter which side scores first in the fight now in the federal court.

Victory for city attorneys will bring a situation that means barring off the streets about $90,000 worth of rolling stock, which, under the present financial conditions of the companies, will deal them a heavy blow. Victory for the companies will permit them to continue operation of one-man cars but with yet other troubles to combat.

One of these is the labor problem. A strike exists now on the Dayton Street Railway. The road is being operated, but the loss of 30 skilled operators was a blow. Though cars are running on regular schedule, the effect of the strike is to divert considerable travel from this state. The People's Railway employees, belonging to Union No. 810, did not go out but the threat will always exist unless some settlement is made with them.

These two roads were the only ones under union organization. Both locals took a strike vote for use as a weapon by their executive committees. The specific demands were for an increase of pay and for adoption of an association contract, which virtually meant a "closed shop" condition. The men had been getting 55 cents an hour and wanted 75 cents.

Union men say that organization is proceeding also on the City Railway, Oakwood line and the Dayton, Springfield & Xenia Southern. At present, these roads employ their men under individual contract binding them not to organize or join a union.

One of the roads, the D. S. & X. S., is operating under a receivership. Technically, Dayton has a 6-cent fare in cases where a transfer to another line is used. One cent is charged for a transfer. The cash fare, however, for a single ride is 5 cents.

The one-man and wage issues in Dayton have been referred to previously.

Chicago Attorneys Prepare Ordinances for February Ballot

Skeleton ordinances providing for transportation referendums in Chicago in February are being drawn by city attorneys as a legal step toward getting a purchase proposal on the ballot. The ordinances will be completed in detail by Jan. 15, next, for passage by the City Council and a campaign probably will be made to get the voters to agree to a purchase of the Chicago Surface Lines at a figure around $162,000,000. All figures will be in blank until the completion of the surface lines appraisal.

The administration announced that in the event the appraisal is not satisfactory to the Mayor, an alternate ordinance will be submitted, but in either case a subway will be provided for. The main ordinance will call for issuance of around $400,000,000 municipal traction notes, to be known as Schwartz certificates, which will pay for the surface lines, a downtown subway and outlying extensions. The estimated price of the elevated, $90,000,000, also is included but no steps have been taken to get an appraisal of the lines.

Wisconsin Commission Has Jurisdiction Over Proposed Road

New developments have taken place in connection with the proposed plans of C. D. Smith, Fond du Lac, president of the Southern Wisconsin Railroad, to build an electric railway from Madison to Sturgeon Bay, via Fond du Lac and Manitowoc.

The Wisconsin Supreme Court on Dec. 9 upheld the Wisconsin Railroad Commission in its decision requiring this line to obtain a certificate of convenience and necessity in spite of the fact that a charter for the line was obtained from the Legislature in 1897 before the commission came into existence. Mr. Smith maintained in his appeal from a lower court that the charter was a sufficient substitute for the certificate required. The commission will have to approve the certificate of necessity before it authorizes the line's proposed bond issue of $5,700,000.

Work has started on the line near Manitowoc. Future progress depends upon action taken by the commission.

Massachusetts Business Body to Demand Bus Regulation

The Association of Chambers of Commerce of Western Massachusetts has voted to instruct a committee to draft a resolution which will express a demand for legislation regulating bus operation and tending to increase taxes levied on buses.

B. A. Hapgood, secretary of the Springfield Chamber of Commerce, said the failure of railroads to take advantage of their opportunities was encouraging travel by automobile. Ray Baker of Boston, secretary of the Massachusetts Auto Dealers and Garage Association, said the bus owners were willing to co-operate in every practical way with the electric railways and the railroads and that they were ready to pay their proportionate share of taxes for highway maintenance. He said buses should be regulated.

Clark V. Wood, president of the Worcester Consolidated Street Railway and the Springfield Street Railway, said the buses were taking the most profitable short-haul business and that they were so increasing street congestion as to interfere with efficient operation of electric railway cars. He declared that any marked increase of bus service would entail intolerable congestion in the centers.

P. R. T. Offers Ground

The Philadelphia Rapid Transit Company has offered to the city as a gift the Burd tract at 65th and Market Streets as a suitable location for the construction of the Municipal Stadium. The acceptance will rest with the City Council. The Mayor has under consideration an alternative proposal from the Philadelphia Rapid Transit Company for the entire tract on condition that the city accept it subject to a $300,000 mortgage.

Aurora Line to Expand Following Shift in Population

Migration of Chicago's downtown workers westward has resulted in the need for the expansion of the facilities of the Chicago, Aurora & Elgin Railroad, which operates a system of third-rail lines of more than 100 miles connecting Chicago and many populous villages in Cook and Page Counties, Ill. In order partially to meet the cost of new work the company has arranged to sell $775,000 of two-year notes to be offered publicly by the bankers after Jan. 1.

Thomas Conway, Jr., president, said part of the money would be spent to build an artistic brick station in Glen Ellyn, where citizens enlisted the electric line in a city beautification program after seeing what the line had done for Wheaton. The Wheaton station is said to be one of the handsomest in the country and is the first of several by which the line hopes to set a new standard for interurban stations.

New block signals will be installed and there will be flash signals for crossroads. A new freight station will be erected in Elgin. The railway has purchased a 1,300-ft. frontage on Broadway, Aurora, and plans to take tracks off the streets inside the city and relocate them along the bank of the Fox River.

Records kept by the railway for 1921-1924 show that the main towns served have doubled in population in three years and that the number of houses in all communities served has increased 79 per cent.

Reconstruction Program in Oakland Progressing

In fulfillment of part of its construction program, recently entered upon, the Key System Transit Company, Oakland, Cal., expects to receive soon 12 new cars intended for use in its service to the ferries. These are the first cars purchased by the company in two years. The previous purchase was of 55 cars of the one-man, two-man car type. It was intended to operate these cars by a single man, but owing to protests against their operation the cars were never used as originally intended. They are now in service under two-men operation.

The new cars are to be used mostly in two-car trains to replace others which are in need of repair. The traffic in the East Bay cities is growing so fast that during the rush-hour periods of each day practically every bit of rolling stock of the Key System is called into use.

Recently the company has been overhauling, repairing and repainting its cars. This work is still going on, but has proceeded slowly owing to the fact that the demands of traffic make it essential to keep as many cars as possible in service.

The Key System's construction program was undertaken in conjunction with the traffic survey instituted six months ago at the instigation of the city of Oakland. This survey has borne much fruit. As a result of it, buses have been purchased and placed in operation in Oakland and Alameda. It is now proposed to establish an additional bus line in West Oakland, linking that center with the manufacturing sections of Alameda and the estuary area, now inadequately served.

It also appears likely that the Oakland City Council will amend the Key System's franchise so as to give the company more favorable terms than are now enjoyed. This is still a matter of future action, but it is understood that the ground has been laid for a move of this kind and that the railway will make extensions and route changes that will greatly improve service.

A new loop system has been proposed for the business section of Oakland and several lines are likely to be extended to outlying sections of the East Bay if there is favorable franchise amendment action.

One of the changes in the franchise desired by the company relates to street paving. The present agreement specifies that the company must keep the space between its tracks properly paved. In accordance with this agreement the company is now making extensive track repairs and paving various streets, but it is pointed out by traction officials that these charges are unfair and really redound to the detriment of the car rider.

Proposed Indiana Road Renews Application for Right to Build

An application for a further hearing on its petition for a certificate of public convenience and necessity to build an electric railway from Owensboro, Ky., to Elnora, Ind., with a bridge across the Ohio River midway between Owensboro and Rockport, Ind., has been filed with the Interstate Commerce Commission by the Owensboro, Rockport & Chicago Railway, a Kentucky corporation with headquarters at Owensboro.

The renewed application was filed following a report to the commission by C. E. Boles, attorney examiner, and E. Gray, engineer examiner, recommending that the application for a certificate be denied. The examiners reported that the company's estimates of anticipated traffic and revenues appeared to be excessive and that its estimates of cost of construction and of cost of equipment, particularly electric locomotives, appeared too low.

The hearing was held before the Indiana Public Service Commission at Indianapolis last September, at the request of the Interstate Commerce Commission. Officers of the company now state that they did not go more deeply into their estimates at that time because they misunderstood the purpose of the hearing. The Indiana commission recommended that the I.C.C. issue the certificate.

The proposed electric railway would be 84 miles long. The bridge across the Ohio was authorized by Congress last April. The company estimated its construction and equipment costs at $6,767,096, of which $2,125,000 would be for the bridge. It proposed to sell $2,500,000 common stock and $6,000,000 bonds to finance the project. E. T. Franks, Owensboro, is president of the company and Major Thomas H. Hazelrigg, a consulting engineer of Indianapolis, is chief engineer.

Unexpected Answers to Appeal for Service Suggestions

That the use of the bus as a feeder to the lines of the Altoona & Logan Valley Electric Railway, Altoona, Pa., is appreciated by the patrons of the Logan Valley Bus Company, a subsidiary, is shown in the hundreds of answers received to a questionnaire sent out recently by S. S. Crane, general manager. The questionnaire sought suggestions from bus patrons.

The company now maintains eleven buses. Five are operated on regular schedule and six make special trips to relieve the railway during the congested hours. Patrons were almost unanimous in asking for extensions of the five bus routes, faster schedules and more buses.

Complaints were of minor details. One critic protested the "heavy odor of gas" inside the cars, another protested "speeding." One 8-year old, riding the school bus, wrote, "We think it lots of fun, especially the bumps." An afflicted individual wrote that the "steps were too high, especially for a rheumatic person."

The many ideas and suggestions received will be carried out as far as practicable.

New Haven Against Buses

Court Orders Sought by Railroad and United Electric Railways to Protect Their Rights

Action was taken on Dec. 20 by counsel for the United Electric Railways, Providence, and the New York, New Haven & Hartford Railroad before Judge Chester W. Barrows in the Superior Court at Providence with bills of complaint against twenty corporations and persons operating bus lines in Rhode Island. The two transportation companies seek preliminary and permanent injunctions and restraining orders against the bus lines. A hearing on the preliminary injunctions was set for Dec. 29 in the Superior Court.

RAILWAY OR BUS

In the bills of complaint the petitioners allege that if the buses are allowed to run it will mean a cessation of railroad facilities. The petitioners claim that the buses are under no regulation, and have asked for no certificates of public necessity and convenience; that the machines are not bonded and not inspected, that no one has control over the fares and the routes and that the buses should not be allowed to continue operations unregulated.

The basis of action is similar to that in a recent case in which William M. Oakley, doing business as the "Overland Limited" between Fall River and Newport, was enjoined from further operation of the line on the prayer of the Newport Electric Corporation under a rescript filed by Judge Barrows.

A. P. Russell, vice-president of the New Haven, said:

> The New Haven cannot longer stand by and see its property jeopardized by this sort of competition. The railroads and electric railways have been authorized to provide transportation for the people of New England. Under that authority the railroads have made an enormous investment.
>
> There may be room for a third transportation agency in New England, but not in the field covered by the railroads and electric railways. The New Haven management feels that any new forms of transportation should be adapted to the use of those existing organizations. Acting on that principle, it will leave no stone unturned to eliminate unfair and unwarranted competition.

Much interest attaches in transportation circles everywhere to the announcement made on Dec. 20 of a plan by which the Boston & Maine Railroad would undergo a physical and financial readjustment, discontinue approximately 1,000 miles of track, obtain $13,000,000 cash for improvements to the lines retained and organize its own motor bus and motor truck service to cover the territory where rail lines are abandoned. Of the 2,450 miles of road more than 1,000 miles handle only 3 per cent of the business. The plan was advanced as part of a general scheme of financial reorganization.

ONLY PROFITABLE LINES TO BE RETAINED

Homer Loring, chairman of the executive committee of the railroad, is the author of the plan. It will be recalled that it was under Mr. Loring's direction that the Eastern Massachusetts Street Railway was rehabilitated. He cut off practically all of the unprofitable lines or those that give very little promise of soon becoming profitable, and then devoted his energies to the intensive development of the remaining lines with good results.

Leavenworth Gives Railway Bus Franchise

The municipality of Leavenworth, Kan., delivered a bus franchise to the Kansas City, Leavenworth & Western Railways on Dec. 17. Conway F. Holmes, president, considered the terms of the franchise favorable, and believed the company would accept them.

An investment of $50,000 or $60,000 is contemplated, to place in service six 29-passenger buses, to operate over the same routes as covered by the railway tracks, which were in need of expensive renewals. The six buses will equal in number the cars that have been in service.

The Kansas City, Leavenworth & Western interurban line between Leavenworth and Kansas City is in better form than in several years, the freight business thriving and the passenger service not having shrunk more than one-fourth in the recent months of interurban bus development.

Contracts Planned for Washington Heights Subway

Following a public hearing on Dec. 17 by the Board of Transportation of New York City on the terms and conditions of the contract for the construction of the Washington Hights subway, which is to be a part of the Manhattan trunk of the city's new subway system, it was announced that the contract drawings for two sections of the line from 111th Street to 131st Street had been completed and that invitations to contractors to bid on the construction would be ready for advertising during the week which will end Dec. 27.

One small section of the line has been under construction since last August.

The construction will be divided into fourteen contracts.

Insurance Fund Impaired by Peculations

Caleb S. Jackson, for many years treasurer of the Eastern Massachusetts Street Railway, has resigned because of irregularities in his account with the Eastern Mutual Insurance Company, of which also he was treasurer. His resignation from both concerns has been accepted. Robert B. Stearns, vice-president and general manager of the Eastern Massachusetts, has been designated by the trustees to take temporary charge of the financial department of the railway.

From a careful examination of the accounts and securities of the Eastern Massachusetts it is learned that they are not impaired, or in any way affected, by the handling of the funds of the Eastern Mutual. Present information indicates an unlawful use of $48,000 of the funds of the Eastern Mutual, which is a subsidiary of the Eastern Massachusetts, organized wholly for the purpose of handling the workmen's compensation claims of the employees of the Eastern Massachusetts.

Free Bus Restrained

Future of Community Buses Up to California Commission—Electric Railways Seek Rights

After the close of a two-day hearing before Commissioner W. J. Hanford of the California State Railroad Commission in Los Angeles, the Community-Merchants' Bus Service now awaits a decision from the state body as to its future existence. The operators of the free bus system have been defying the orders of the court by operating their buses from Los Angeles, Culver City and Venice without a certificate, but after they had been fined for contempt of court they decided to cease operations and apply for a permit to continue operations. They have also decided to offer no further resistance to the courts until the Railroad Commission has decided the matter.

RAILWAY OPPOSES PLAN

The application of the Merchants' Bus Service, formerly known as the Community (Free Buses) Bus Line, was considered at a hearing based on an application of the Pacific Electric Railway. That company sought permission for a franchise to operate a bus line from Los Angeles to Culver City and Venice, but over a slightly different route from the one outlined in the application of the Merchants' Bus Service. The railway proposed to run its buses so as to connect with its electric cars at Los Angeles and operate along Washington Boulevard all the way to the proposed terminus at Venice. The railway planned to charge the same fares for its proposed bus line as are now charged on its electric interurban trains operated between Los Angeles and Culver City and Venice.

The Free Bus System seeks permission to continue its present schedule of fares, namely 10 cents from terminus to terminus. But the bus service is not rendered complete in going between Venice and Los Angeles, as the passengers are picked up or unloaded at the city limits of Los Angeles or at the end of the Los Angeles Railway's Washington Street line, whereby passengers are obliged to pay a 5-cent fare on the local car line in Los Angeles.

The electric line offers a system of fares which consists of round-trip rates, family, commutation and other special fares, which in some cases give rides for less than the bus men charge.

PLEA FOR CO-ORDINATION

At the hearing J. Ogden Marsh, chief engineer of the Los Angeles Board of Public Utilities, stated that the Board of Public Utilities of Los Angeles was engaged in trying to unify into one system the local street car lines in Los Angeles of the Pacific Electric Railway and Los Angeles Railway, as well as all bus lines for improvement and continuity of service and to make universal transfers possible. For that reason, he said, the board favored the granting of bus line franchises to the street railways.

The Pacific Electric Railway informed the commission that it had eight new 29-passenger buses available for the new service, provided the commission approved of the railway's application.

Inquiry Conducted Into Oakland Wreck

The worst accident in the history of East Bay electric train service occurred during the rush hour the morning of Dec. 4. A single car train of the Sacramento Short Line, westward bound, crashed into a four-car train of the Key System Transit Company on the Key line's fill a short distance from the Oakland mole. The Sacramento car telescoped the lighter rear car of the Key train half its length, killing six passengers and maiming 22 others. Subsequently two of the injured died in hospitals, bringing the death list up to eight.

Immediately after the accident investigations were started by the coroner, the State Railroad Commission and by each of the two railroads. The problem of fixing responsibility proved a knotty one, owing to the peculiar conditions under which that portion of the road on which the crash occurred is operated.

Details of Operation Developed

The fill is the property of the Key System Transit Company, but is used jointly by the Key and Sacramento trains. The switches and safety devices are all under Key System control. Trains running on the fill are subject to the orders of Key officials. These facts were brought out at the hearing in the Key Building in Oakland the day after the wreck by H. A. Mitchell, vice-president and general manager of the Short Line. Mr. Mitchell produced a contract dated Jan. 20, 1911, in support of his testimony. E. E. Thornton, division superintendent of the Key System, however, denied that his company was responsible for what Short Line employees do while operating their own trains on Key tracks. To this Mr. Mitchell replied that no men are put on Short Line trains that operate over Key Line tracks until they have been passed upon by Key System officials. Manager Thornton accused the Short Line motorman of being in a previous crash with a Piedmont Key train at Fortieth Street and Telegraph Avenue. Mr. Thornton said:

> If the motorman of the Sacramento train had been working under Key System regulations there would have been no subsequent accident in which he could have participated, for the reason that he would have been disqualified from further service.

He further explained that all Key System trains are equipped with a "dead man" device.

Mr. Mitchell admitted that his train did not have such a device, but explained that it was equipped with other safety devices.

Testimony at the hearing showed that the signals on the fill were found to be in good working order after the accident. It was also brought out that the brake valves of the Short Line car were inspected before the accident and found to be in perfect working order. The brakes and brake devices, examined after the wreck, were found to be in excellent condition.

These points were brought out at the hearing:

1. That the Key train had come to a complete stop before the crash.
2. That the Short Line train went by at least two danger signals.
3. That it had been raining and the tracks were slippery.
4. That the crash came about 30 or 35 seconds after the Key train had stopped.
5. That the Short Line train was traveling at the rate of about 30 m.p.h. when first sighted by members of the crew of the stalled train.
6. That there was good visibility.
7. That both trains were late.
8. That there are no speed regulations on the fill.

Members of the board of inquiry named by the Key System and Short Line included:

Frank Mott, former Mayor of Oakland; Samuel Irving, former Mayor of Berkeley; J. C. McPherson, superintendent of the East Bay division of the Southern Pacific Company; W. Arnstein, president; L. H. Rodehaugh, traffic manager, and F. A. Miller, superindent of power and equipment of the Sacramento Short Line; W. R. Alberger, vice-president and general manager of the Key System Transit Company; J. P. Potter, superintendent of transportation of the Key Line, and W. P. Jackson, master mechanic of the Key.

Mr. Mitchell declared that the fact that the frame of the Short Line car was higher than the frame of the Key Line car accounted for the telescoping.

Litigation in Spartanburg Officially Ended

The mandate of the Supreme Court of the United States, affirming the judgment of the Supreme Court of South Carolina in the case of the city of Spartanburg against the South Carolina Gas & Electric Company was filed in the office of the Supreme Court of South Carolina recently. This permanently ends one of the biggest cases that has ever been tried in Spartanburg. This was a proceeding in mandamus to compel resumption of street car service.

The case was practically settled by consent. Some weeks ago R. L. Peterman, manager of the Barstow interests in South Carolina, new owners of the South Carolina Gas & Electric Company, appeared before City Council and voluntarily agreed to withdraw their appeal. The city agreed to this, and under this arrangement the appeal was abandoned and ordered dismissed by the court.

The Barstow interests agreed to abandon the appeal of the South Carolina Gas & Electric Company from the South Carolina Supreme Court's decision on the ground that they did not care to be working under the disadvantage of a long-standing litigation.

The new company has petitioned for a 10-cent fare between Morgan Square and the city limits. A 10-cent fare has been in effect for some time on the car lines between East Spartanburg and Clifton. A 7-cent fare was charged within the city limits by the South Gas & Electric Company under the old ownership and prior to the discontinuance of car service in the city. Ten cents was also charged outside the city limits. At present a 10-cent rate is in effect on the buses. The new owners for several months have been at work rehabilitating the old car system.

News Notes

Court Allows One-Man Cars Temporarily.—On the day that the ordinance prohibiting one-man car operation on the lines of the Connecticut Company in New Haven, Conn., was to become effective an injunction was obtained by George D. Watrous, representing the company, from Judge Isaac Wolf of the Superior Court permitting the present status of operation to continue until Jan. 6. The injunction enjoined the chief of police and city officials from attempting to enforce the provisions of the ordinance recently passed by the Board of Aldermen. The action of the board was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 6. The hearing on Jan. 6 will be to determine whether the injunction shall be made permanent.

Considers Utility Courses.—The University of Oklahoma has under consideration the offering of utility courses in its regular curriculum. Such utility studies were recently added to the course of work in the University of Pennsylvania.

Railway Service Wanted.—More than 100 residents of Marlboro, Mass., have filed a petition asking the City Council to exert its influence to retain the service of the Worcester Consolidated Street Railway on the Northboro road section. The railway officials threatened to abandon service between Marlboro and Northboro if business fell off because of bus competition. The City Council decided not to restrict bus lines with reference to taking on and discharging passengers on the route between Marlboro and Westboro. The Marlboro Chamber of Commerce likewise is against any drastic change in the present transportation arrangements. The railway fare is 59 cents one way between Marlboro and Worcester, while Terry Carlstrom, bus proprietor, has announced he would sell 12 tickets for $4 or at the rate of 33⅓ cents a trip.

Advertisements Told Strike Story.—The Illinois Traction System, Chicago, Ill., told the story of the incidents leading up to the recent strike situation and its position in the matter by means of display advertisements in the papers in its territory and a series of letters to employees. By these means the people in its territory were offered every opportunity to know all of the facts concerning the situation. E. E. Soules, manager of the publicity department of the railway company, directed the work of placing the statement with the newspapers.

Life Insurance Increased.—Employees of the Kansas City, Leavenworth & Western Railway, Kansas City, Kan., have increased their group life insurance coverage by more than $63,000, bringing the total in force to about $150,000. Both the original and additional insurance policies were issued by the Metropolitan Life Insurance Company on the co-operative group plan, under which the railroad company and the workers jointly pay the premiums.

New Franchise Increases Service.—Interurban service between Cleveland and Bedford, Ohio, will be increased by the Northern Ohio Light & Traction Company and the fare increased by 5 cents. This follows a referendum vote of approval on a new franchise for the company by the voters of Bedford.

Court Dismisses Old Suit.—A suit involving reversion of the Omaha & Council Bluffs Street Railway's property to the city of Omaha, Neb., and popularly supposed to be still on a District Court docket, subject to an order to reopening, was dismissed at the city's cost by the court on Dec. 11. This suit grew out of the first franchise grant made to the Omaha horse railway in 1867. The grant specified that the property of the company should revert to the city after 50 years. The company was absorbed by the lines that went later into the present system.

Fares Lowered.—The Maine Public Utilities Commission has rendered a decision permitting the Androscoggin & Kennebec Railway, Lewiston, to make changes in its fare zones which will give many patrons a 10-cent reduction on every trip because of the extended fare limits. In view of the fact that the proposed changes in the fare zone limits would result in an extension of the present fare limits and would be of mutual benefit to the petitioner and patrons, the commission said it would approve the petition.

Will Petition for Charter.—Judge J. Moss Ives, receiver of the Danbury & Bethel Street Railway, Danbury, Conn., and others associated with him will petition the Connecticut General Assembly for a charter to operate an electric railway system and power generating plant. The company will be designated as the Danbury & Bethel Power & Transportation Company, and if authorized may take over the company now operating, foreclosure of which has been ordered by the court on the petition of first mortgage bondholders. It is also proposed to take over charters of the Danbury & Bethel Traction Company, and the Bridgeport & Danbury Electric Railway.

Old Equipment in Service. — The Illinois Power & Light Company has placed a bus in service between the center of Des Moines and the power plant of the company located some 6 miles southeast of Des Moines. The bus was one acquired from some of the original bus operators in Decatur, in which city the company has co-ordinated the railway and bus service. The bus is used merely to haul the workmen between the plant and the city. The company has also placed in service between South Omaha, Neb., and Ralston, three buses acquired from the old equipment in Decatur at the time of the purchase. These three buses supplement service to the interurban line between the two towns.

New Proposal Offers Bus. — The Philadelphia Rapid Transit Company, Philadelphia, Pa., has requested permission of the Delaware River Bridge Joint Commission to operate a bus route across the Delaware River Bridge, connecting Philadelphia with a suitable place in Camden. The plan would afford passengers the same fares and transport privileges as obtain now in Philadelphia. The company wrote to the Delaware River Bridge Joint Commission a few months ago asking to extend the transportation system, offering both street car and bus service. Later, at a hearing before the executive committee of the Bridge Commission, details of the proposed service were discussed. Since that meeting the company has been requested by the Reading Railroad to consider a bus route over the bridge to Camden which would give service to the Reading's new Camden terminal.

Christmas Checks for Safe Work.—Christmas letters in the form of checks were received recently by 321 motormen, conductors and operators of the Nashville Railway & Light Company, Nashville, Tenn., as a bonus for their work in the safe operation of street cars for the past three months. The amount paid out by the company this quarter was $3,140, increasing the total bonus payments in the safety campaign for the past 11 months to $7,383. According to John J. Connors, safety director of the company, the safety campaign has been responsible to a great extent for the 60 per cent reduction in street car accidents since 1920.

Wants Fare Increase.—Officials of the Milford & Uxbridge Street Railway, Milford, Mass., recently asked the State Department of Public Utilities for an increase in fares from 10 cents to 13 cents with the right to sell nine tickets for $1. Children's and workmen's fares would not be increased. The officials claimed that no dividends had been paid since 1916 and that this year no taxes could be paid or interest on loans.

Placards Will Tell Story.—Councilman Philip Tindall will ask the City Council of Seattle, Wash., to provide for printing placards to set forth the financial progress of the Seattle Municipal Railway. He states that Seattle's railway has spent approximately $2,000,000 in rehabilitation of the system since the property was taken over by the city on April 1, 1919; this in addition to the paying of all operation and maintenance expenses, paying off bonds and meeting interest payments. He plans to acquaint the people of the city with the true status and accomplishments of the line since it became city property.

Spencer Circulates Car Petitions.—Petitions are now in circulation in Spencer Mass., for presentation to the Worcester Consolidated Street Railway to show that there is sentiment for restoration of the lines to Leicester and Worcester, Mass., discontinued some months ago. It is proposed to open the question to general discussion at the town meeting in March.

Wins Road Ownership.—Cliff Little of Gadsden, Ala., is awarded the property of the Gadsden, Bellvue & Lookout Railroad, in North Alabama, in a case decided by the Circuit Court at Gadsden, Ala. on Dec. 15. The road operates from Gadsden, Ala., for several miles through the mountain section of North Alabama. It was alleged that the owners refused to refund money paid out by him for running the road or give him possession of it. Under the decision of the court the owners may hold the road in the event they immediately refund this money, together with interest and attorney fees. Otherwise the road becomes the property of Mr. Little.

Expert's Report Awaited.—Milo R. Maltbie, New York, has been engaged by the Cincinnati, Ohio, Chamber of Commerce as the expert adviser of that organization's traction committee. Mr. Maltbie has started his work and expects to have a preliminary report ready by Jan. 1 on the traction situation in Cincinnati.

Bonus Checks Distributed. — Bonus checks totaling $106,680 were distributed to 2,330 motormen, conductors and safety car operators on Dec. 15, under the merit and bonus system of the Los Angeles Railway, Los Angeles, Cal. This is the fifth Christmas season in which the bonus has been paid. A new high record is established in the amount paid and in the number of men receiving checks. The Christmas bonus is in the form of payment for special service rendered by trainmen during the year.

To Grant Petition Would Be Discriminatory.—Taking the view that a discriminatory action was being asked, the Board of Public Utility Commissioners of New Jersey denied the request of employees of the Pennsylvania Railroad for a modification of the Public Service Railway fare zones from Jersey City and the Meadow Shops at Kearney and from Newark to the Meadow Shops. The board held it would be unjust to change the zones in favor of these employees without extending the same privilege to all passengers. It said that while the present municipal zoning system might require modification in the future, such modification should not be made under this application.

Wants to Run One-Man Cars.—The Northern States Power Company has petitioned the Wisconsin Railroad Commission for permission to establish one-man car service on its line between Eau Claire and Chippewa Falls. At the hearing no opposition of residents was voiced.

Urge Widening Woodward Avenue.—Sidney D. Waldon, president of the Detroit, Mich., Rapid Transit Commission, recently stated his reasons for recommending the widening of Woodward Avenue, to be available for a four-track route. He believed that measures should be taken at once to adopt a uniform width of 120 ft. on the avenue from the Detroit River to the entrance of Palmer Park. The recommendations were made in a letter sent to the Woodward Avenue Improvement Association, which had asked for information as to the necessity of widening the thoroughfare. The association's letter, which was signed by John M. McKerchey, president, asked the commission to state the reasons it had to offer for recommending the expenditure of the sum required for the widening project. The Detroit *News* of Nov. 16 referred to the transit commissioners' suggestions.

Financial and Corporate

Plans Acquisition of Bus Company

Detroit Street Railways to Serve Sections of the City Now Without Transportation Facilities

The immediate establishment of bus service in certain sections of the city of Detroit and the ultimate taking over of the Detroit Motor Bus Company are in line with the new policy of the Department of Street Railways, according to a general outline of the transportation question by Mayor John W. Smith. Mr. Smith pointed out that the acquisition of the bus company's property must come eventually, and that the fact is realized by city officials and directors of the bus company.

The Department of Street Railways plans to have immediately a fleet of 25 buses to serve sections of the city which as yet have no transportation facilities and the bus service will be augmented as soon as the Council formally approves the purchase of the new double-deck buses recommended by the Street Railway Commission.

Before the city can proceed very far with plans for a complete and unified transportation system including street cars and buses, according to the mayor, legislation is necessary which will establish for the city the rights to its streets. The existing laws give the city the right reasonably to control the use of the public streets but an ordinance must be passed giving the city more complete control of the pavements. The mayor cites that at the present time a score of bus companies are operating into the city of Detroit from neighboring municipalities. The solution of this problem is one of the first to be faced by city authorities, the Mayor considers.

It is believed by Mayor Smith that the decision handed down by the Supreme Court in the case now pending concerning the right of the city to control its streets as far as the jitneys are concerned will pave the way for the passage of an ordinance relative to bus operation in the city.

To the Street Railway Commission will be left the working out of a proper system of bus transportation in the outlying districts. It is claimed that in some of the districts, citizens have to walk a mile or even farther to get to a street car. It is in these sections that the bus will be used to carry passengers to the car lines and transfers will be issued for the trip down town.

Immediate contracts for five buses from each of the three bidders who bid upon the city's request for proposals on 50 buses are urged by the Mayor and the Street Railway Commission but formal approval of this action has not yet been given by the City Council. The commission points out that immediate contracts should be let to insure delivery of the buses by spring. It is not anticipated that the buses will operate into the down town section for the present at least. They will be used only as feeders in connection with the car lines.

The Mayor believes that the eventual acquisition of the Detroit Motorbus Company's property is necessary in order that a maximum of service may be rendered the public. With the present company running equipment on parallel routes with the street car lines the most efficient service cannot be accomplished. It is pointed out that as the bus company is operating under a day-to-day agreement without a franchise, not much change would result from the city's acquisition of the bus company's equipment. Although the buses could be stopped from running on very short notice it is realized that a valuable service is being rendered by the buses and there is no disposition on the part of city officials to take any action that might result in discontinuing the bus service.

Sale of 26-Mile Road Sanctioned

The property of the Interstate Consolidated Street Railway, Attleboro, Mass., is to be sold at public auction by Zenas W. Bliss, the receiver. Judge Crosby of the Supreme Court of Massachusetts has authorized the sale. As receiver Mr. Bliss asked for authority to sell on the ground that the company cannot earn its cost of maintenance; that it is unable to meet its obligations as they mature, and that it would be of no advantage to the creditors, stockholders or the public to continue the receivership. The road operates 26 miles of line from Plainville, in Wrentham, through North Attleboro and Attleboro to the Rhode Island line, and a line from Attleboro to Seekonk to the Rhode Island line. The sale will be held in Attleboro.

$51,138 Below Return

Rochester Lines Show Deficits on Railway and Bus Operations—3,000,000 Fewer Passengers

For the fourth year under the service-at-cost contract the Rochester lines of the New York State Railways failed by $51,138 to get the 6 per cent return on their base value guaranteed by the contract. This fact was disclosed in the recent report of Charles R. Barnes, city railway commissioner, for the year ended July 31. The base value for the year covered by the report is stated at $19,573,606. The detailed results are shown in the accompanying table.

The returns are fixed at $1,162,598 for street car operations and $5,465, for the bus lines or a deficit of $41,890 and $9,249 respectively. The company began the operation of buses on Nov. 1, 1923. The shortage for the four years since the inception of the service-at-cost contract follows: First year, $133,998; second year, $94,001; third year, $47,642, and fourth year, $51,139.

Nearly 3,000,000 fewer passengers were carried for this year than in the preceding one, although 94,448 car-miles were run. This represented the high water mark since the signing of the contract. The unusually open winter, making possible greater use of autos, and adverse business conditions in the early part of the year are held responsible for the decline.

Commissioner Barnes commented upon the fact that the automobile affects the lines adversely in two ways, decreasing revenues by taking away passengers and by adding to the traffic congestion, retarding the movement of cars and increasing operating costs. The retarding of car movement has been acute since the city of Rochester installed a signal light control system on its main street, creating a problem for street cars and vehicles, particularly the former.

RESULTS OF OPERATION AT ROCHESTER FOR YEAR ENDED JULY 31, 1924

	Railway	Co-ordinated Bus Lines*	Combined
Revenue from transportation—			
Passenger revenues	$5,027,845	$41,117	$5,068,962
Miscellaneous transportation revenues	2,533	....	2,533
Total revenue from transportation	$5,034,081	$41,920	$5,078,011
Revenue from other operations			
Station and car privileges	$49,562	....	$49,562
Rent from tracks and facilities	42,297	....	42,297
Rent from buildings and other property	34,577	....	34,577
Total revenue from other railway operators	$126,436	$41,929	$126,436

Deficit	$41,890	$9,248	$51,138

* Bus operation started Nov. 1, 1923.

Submits Report on Denver Tramway Operation

E. Stenger, receiver of the Denver Tramway, Denver, Col., recently presented the following report to the United States District Court covering operations from Dec. 24, 1920, when he was appointed receiver, to Oct. 31, 1924:

CONDENSED STATEMENT OF NET INCOME PERIOD DEC. 24, 1920, TO OCT. 31, 1924

	Accumulative Dec. 24, 1920, to Dec. 21, 1923	January to October, 1924	Accumulative Dec. 24, 1920, to Oct. 31, 1924
Total revenue from transportation	$14,136,741	$3,733,107	$17,869,848
Total revenue from operation other than transportation	514,900	162,308	677,208
Total operating revenue	$14,651,641	$3,895,415	$18,547,056
Total operating expenses	9,802,256	2,542,433	12,344,689
Net operating revenue	$4,849,385	$1,352,981	$6,202,366
Total miscellaneous income	36,462	20,910	57,372
Gross income less operating expenses	$4,885,847	$1,373,891	$6,259,738
Total deductions from income	4,237,966	1,178,117	5,416,083
Net income	$647,881	$195,774	$843,655

Georgia Interurban in Danger of Suspension

Preston S. Arkwright, president of the Georgia Railway & Power Company, Atlanta, Ga., recently sent a letter to the Mayor and the Council of Marietta protesting the establishment of bus lines and warning that the interurban railway could not continue to operate under bus competition. The letter stated that granting permission to operate a bus between Atlanta and Marietta over a public highway supported in part by the railway was unfair and such operation was taking away essential revenue. He said that the Atlanta Northern Railway was opened for operation in 1905, and in every place possible along all parts of its route outside of incorporated cities it was built upon a private right-of-way bought and paid for by the railway. In the 19 years of its existence the company has not paid a single dollar in dividends, but has accumulated a floating debt of $145,000. In 1923 it failed by $11,550 to earn bare operating expenses, taxes and renewals. He said that the Atlanta Northern Railway could not face bus competition as the electric lines in Atlanta had been forced to face jitney competition. He said that there was no public convenience served by these buses and that their continuance would seriously hamper, if not completely destroy, the effectiveness of the electric railway.

276,460,074 Passengers Carried by Wisconsin Railways

The public utilities in Wisconsin have shown a steady growth with a total valuation on Dec. 31, 1923, of $376,679,440, according to the biennial report of the Wisconsin Railroad Commission for 1922-1923. This is an increase of 60.13 per cent over the $235,332,138.13 valuation of utility properties on June 30, 1917.

The electric railways showed losses in the number of passengers carried in the last few years. A high mark of 287,905,241 passengers was established in 1920 compared with 222,508,368 in 1917. In 1922 the total number of passengers carried during the year dropped to 262,110,613, while in 1923 the number of passengers carried increased to 276,460,074. Operating revenues increased from $11,323,223.38 in 1917 to $20,032,358 in 1922. Expenses, however, increased even more rapidly and the ratio of expenses to revenues rose from 74.61 per cent in 1917 to 84.6 per cent in 1922, and by the end of 1923 this figure had decreased only 1 per cent, although the revenues for 1923 had increased to $22,397,270.

Discontinuance of Train Service Allowed in Niagara Section

Upon the assurance of the New York Central Railroad that it will sell commutation and special trip tickets good between Suspension Bridge and Lewiston at its ticket office at Suspension Bridge and that all tickets reading to or from Lewiston via New York Central will be honored on the Niagara Gorge Railroad and Niagara Gray Bus Line, the Public Service Commission on Dec. 12 permitted the New York Central to discontinue its train service between Suspension Bridge and Lewiston.

At a hearing on Nov. 7 on the commission's order to the Central to show cause why it should not continue service, it was brought out by the railroad that an arrangement had been made whereby the Niagara Gorge Railroad will operate cars between Niagara Falls and Lewiston in connection with New York Central trains. The Niagara Gorge Railroad also operates the Niagara Gray Bus Line, operating between Niagara Falls and Lewiston and beyond, giving practically a two-hour service each way. The commission reserves the right to direct the resumption of train service.

Divisible Receipts Greater in Chicago

The Chicago Surface Lines announced a substantial gain in its 45 per cent of divisible receipts for November over the same month a year ago, though a slight falling off from October. The city gets 55 per cent of the net receipts. The Surface Lines share was $132,981 for November, 1924, against $86,685 for November, 1923, and $169,523 for October, 1924. The company's efforts to reduce operating expenses are shown in the comparison of $3,727,303 November expenses and $3,877,750 in October. Trainmen received $1,683,001 wages as against $1,785,503.

The number of passengers carried in November declined to 120,540,271, against 127,729,691 in October, but the average fare rose from 3.82 cents to 3.83. A compared income account for the two months shows:

	November	October
Gross earnings	$4,710 210	$4,963,509
Expenses	3,727,303	3,877,750
Residue receipts	982,986	1,085,759
Joint account expense	20,000	20,000
5 per cent interest on purchase price	667,391	689,040
Divisible receipts	295,515	376,718
City's share	163,533	207,195
Company's share	132,981	169,523

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials.

Wages index is relative average maximum hourly wage of motormen, conductors and operators on 100 of the largest street and interurban railways in the United States, weighted according to the number of such men employed.

Raleigh Company Not Reorganized

It was erroneously stated in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 20, 1924, that the Carolina Power & Light Company, Raleigh, N. C., had been acquired by J. G. White Company and reorganized. The company acquired by J. G. White Company is the Carolina Light & Power Company, Aiken, S. C. The Carolina Power & Light Company operates the railway system in Raleigh, N. C., and also does a general lighting, power and gas business. The Carolina Light & Power Company is a power and lighting property. It does no railway business.

Auction Sales in New York.—At the public auction rooms of A. H. Muller & Sons there were sold this week $45,000 Shawnee-Tecumseh Traction Company, Shawnee, Okla., first mortgage 5 per cent 10-20 year gold bonds, due 1926; June, 1922, coupons on; 20 per cent.

Short Line Given Up.—Fitchburg & Leominster Street Railway has abandoned its 5-mile line between Fitchburg and Lunenburg, Mass. The action of the road was due to lack of patronage, which made operation a loss. Bus line owners are investigating the possibilities of operating between Fitchburg and Lunenburg.

Income Lower.—For the 5 months of the fiscal year ended November, 1924, the net corporated income of the Brooklyn City Railroad, Brooklyn, N.Y., was $595,493, against $792,341 for the corresponding 5 months in the last year. The passenger revenue for the 5 months ended with Nov. 30, 1924, totaled $4,708,989, while for a similar period in 1923 this item stood at $4,880,417. Expenses and taxes for the period this year were $4,090,439, which differed slightly from that of last year, when the figure was $4,048,268.

Balance Lower—Bus Service Extended.—For the eleven months ended Nov. 30, 1924, the gross income of the Republic Railway & Light Company, New York, N. Y., amounted to $9,557,946, against $9,027,895 for a similar period last year. The balance for depreciation, dividends and surplus amounted to $578,232 for the period of January through November of the current year and $635,363 for a similar period of 1923. The company, through its subsidiaries, operates 23 buses in interurban service and 57 buses in city service. Recently an important subsidiary, the Pennsylvania-Ohio Power & Light Company, started bus service between New Castle and Sharon. In the Nov. 29 issue of the ELECTRIC RAILWAY JOURNAL this company was inadvertently referred to as the Pennsylvania Power & Light Company.

Approve Liquidation Plan. — The stockholders of the Railways Company General approved a plan for the proposed liquidation of the company on Dec. 10. The property of the company is held by two corporations. The Railways Company General, which is a New Jersey corporation, has for some years held securities of several electric railways and accounts receivable, among which is the entire capital stock of the Victory Park Land & Improvement Company, Inc. The latter company is a New York corporation and was organized to hold the real estate owned by the Railways Company General. The assets of the Railways Company General will be transferred to the Victory company for an arbitrary consideration. Each stockholder of the Railways Company General can surrender his stock and take his pro rata share of the Victory company stock. As the capitalization now exists, this will give to each shareholder of Railways Company General two shares of Victory Company for one share of Railways Company General that he now holds.

Revenue Up.—For the eleven months months ended Nov. 30, 1924, the Philadelphia Rapid Transit Company, Philadelphia, Pa., had a net income of $1,895,868, against a net income in 1923 of $1,890,437. The passengers carried totaled 829,812,333 in the period from January to November, 1924, and 836,817,620 for the similar period in 1923. The passenger revenue from January to November this year amounted to $40,669,902 and for the 11 months of 1923 the amount was $40,265,921. Passenger statistics for November, 1924, the second full month of operation on the new fare, show that 74,087,646 passengers were carried, bringing a revenue of $4,010,418 against a revenue in November, 1923, of $3,771,562. The number of 8-cent fare passengers during November this year was 2,833,384. The 7½-cent token passengers totaled 48,581,229. The 5-cent fare zone line passengers numbered 1,100,404. Transfer passengers totaled 18,835,463.

Abandoned Property to Be Sold.—All the property of the Nevada County Traction Company, which formerly operated between Nevada City and Grass Valley, Cal., will be sold Jan. 17, 1925, by Frank Steel, commissioner named by the Superior Court. The sale is to satisfy a judgment of $67,000 obtained by the Mercantile Trust Company, San Francisco. Almost a year ago the company petitioned the California Railroad Commission for permission to abandon railway service. The property of the company was covered by a mortgage which was ordered foreclosed and sold by the Superior Court.

Ordered to Sell Power Equipment.—The receivers for the Dayton, Covington & Piqua Traction Company were directed to sell three boilers in the company power plant at West Milton, Ohio, for not less than $4,500 in an order filed in U. S. District Court recently by Judge Smith Hickenlooper. The receivers in their application pointed out to the court that a saving of $10,000 had been recorded annually by purchasing their power from foreign sources.

Commission Approves Issue. — The Public Utilities Commission of the District of Columbia has authorized the Washington Railway & Electric Company to sell $1,850,000 of general and refunding mortgage 6 per cent, ten-year gold bonds, secured by mortgage of Nov. 1, 1923. The issue is for the purpose of retiring a similar amount of Metropolitan Railway first mortgage 5 per cent bonds, due Feb. 1, 1925.

Appeals on Tax Decision. — Judge Thomas Bailey of the County Court recently decided that the Lewistown & Reedsville Electric Railway, Lewistown, Pa., must pay $4,000 annually for ten years for use of the Juniata River bridge, between Lewistown and Lewistown Junction. Following this announcement the company decided it would discontinue service across the bridge on Dec. 31. Through the efforts of the Chamber of Commerce, the county, the railway representatives and business firm representatives met in the community hall to consider the company's action in suspending action over the bridge. Day & Zimmermann, Inc., manager of the railway, were represented by J. A. Dewhurst and Chester Wilson. The company made a report of its business. During the twelve months period ended Oct. 31, 2,230,000 revenue passengers were handled at an average fare of 6.58 cents. Of the more than 2,000,000 people who were carried during the past year, 434,000 rode on cars over the river bridge. The company has taken an appeal from the rental decision. It states that an agreement could come about by passing the tax to the users of the bridge, discontinuing the existing railway service as a losing venture and substituting buses.

Boston Road Does Well.—The Boston Elevated Railway, Boston, Mass., showed a profit for operations in November. Edward Dana, general manager, said that the road had "turned the corner." Receipts from fares on Dec. 20 were $126,844, the greatest in the history of the road. Wage increases granted recently were said to have been more than offset by reductions in the working force and economies in purchase and operations.

Will Cease Operations.—The Nassau County Railway, operating between the Long Island Railroad station at Sea Cliff and Sea Cliff village, notified the Public Service Commission on Dec. 22 that it will cease operation on Jan. 8. Arrangements are under way between the company and the Sea Cliff authorities for a bus service.

Trolley Line Gives Up.—The Warren-Bristol line of the United Electric Railways, Providence, suspended service on Nov. 23 and simultaneously a bus line was started. Three buses will be maintained during normal service and a fourth added during the rush hour.

Earnings Lower.—The gross earnings of the railway department of the Cumberland County Power & Light Company, Portland, Me., for eleven months of this year are $117,191 less than for a similar period last year. The November gross earnings of the railway department were $110,408 compared with $121,449 during the similar month of 1923. The decline in gross earnings is due, it is said, to the use of the automobile.

Employees All Stockholders.—C. H. Harvey, president and general manager of the Knoxville Power & Light Company, Knoxville, Tenn., recently announced that every employee was a company stockholder. Stock of the company paying a 7 per cent dividend was opened to public subscription on Sept. 1.

Leaves Directorates.—Colonel Sheldon Potter has submitted his resignation as city director of the Philadelphia Rapid Transit Company, Philadelphia, Pa. The two other representatives of the city on the board are Mayor Kendrick and Ernest Trigg.

Personal Items

Wisconsin Officials Take on New Duties

S. B. Way, vice-president Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has been named president of the Peninsular Power Company, which was recently acquired by the North American Company. A. K. Ellis, general manager of the Wisconsin Traction, Light, Heat & Power Company, Appleton, Wis., was named vice-president in charge of operations in addition to his duties with the Appleton properties.

For practically 25 years Mr. Way has been connected with the public utility business and during all that time he has been associated with the interests of the North American Company. Seven years ago he became vice-president and general manager of the Milwaukee property. At one time he had been actively engaged in the management of the Wisconsin Gas & Electric Company, the Watertown Gas & Electric Company, Burlington Electric Light & Power Company and other important utilities in Wisconsin.

A. K. Ellis, who has been named vice-president, was for many years secretary-treasurer and general superintendent of the Wisconsin Traction, Light, Heat & Power Company. He was made general manager in the summer of 1923. The properties recently acquired by the North American Company serve a number of communities in Wisconsin and northern Michigan, including Crystal Falls, Iron Mountain and Iron River.

H. V. Bozell Joins Bonbright & Company

Harold V. Bozell, for the past two and a half years co-editor of *Electrical World* with W. H. Onken, Jr., has resigned, effective Jan. 1, 1925, to join Bonbright & Company, Inc., New York, investment bankers dealing almost exclusively in bonds and preferred stocks of electric light and power companies. During his five years with the McGraw-Hill Company Mr. Bozell has been co-editor of the ELECTRIC RAILWAY JOURNAL, editor of *Bus Transportation* and co-editor of the *Electrical World.*

Mr. Bozell's work with Bonbright & Company will be largely advisory, covering utility operations and technical matters, and his appointment represents an expansion of Bonbright & Company in the direction of maintaining more intimate contact with the light and power industry.

After his graduation from the University of Kansas, his native state, in 1908, Mr. Bozell spent nine years at the University of Oklahoma, where, as a professor, consulting engineer and secretary of the Oklahoma Utilities Association, he was very active in promoting technical education and public interests generally in the state. His good work there resulted in his becoming assistant professor at Yale University in 1917 and continuing in that position until he joined the McGraw-Hill staff. At Yale he developed graduate courses in public utility management and finance.

Mr. Bozell has been very active in association affairs. He takes with him to his new work the best wishes of his many friends, including those of his associates in the McGraw-Hill Company.

C. Henry Dahl Promoted at Winnipeg

C. Henry Dahl has been appointed assistant general manager of the Winnipeg Electric Company, Winnipeg, Man. For the past twelve months Mr. Dahl has occupied the position as assistant manager, and prior to that time was statistician for the company. In his new position Mr. Dahl will have charge of the operating of the railway, electric and gas utilities, as well as the electric and railway business of the two subsidiary companies — the Suburban Rapid Transit Company and the Winnipeg, Selkirk & Lake Winnipeg Railway.

C. H. Dahl

Mr. Dahl is a graduate of the University of Wisconsin, where he specialized in railway transportation, public utilities, statistics, money, banking and other political economy courses. From 1917 to 1919 he worked for the Wisconsin Railroad Commission as case investigator in public utility cases. He joined the Winnipeg Electric Company as statistician in November, 1919, and in less than four years was made assistant to the vice-president. Later in 1923 he assumed the duties of assistant manager of the operating department.

Mr. Dahl's appointment follows the retirement of John Whitsell as operating manager of the company.

E. V. Caton, formerly electrical engineer, has been appointed manager of the light and power department.

All Mr. Dahl's Time to Brooklyn Company's Problems

Gerhard M. Dahl, chairman of the board of the Brooklyn - Manhattan Transit Corporation, will hereafter devote his entire time to the affairs of that company. When Mr. Dahl became chairman of the corporation more than a year ago, he expected to devote only a part of his time to its affairs. The transit problems of Greater New York, however, during the past 18 months have become so important and absorbing that he has decided to devote all his time after Jan. 1 to the corporation in the hopes that he may be of service to the community in the further development of adequate rapid transit. He is retiring from the firm of Hayden, Stone & Company. His retirement from the firm, while a loss to it and a financial sacrifice by Mr. Dahl, will, of course, make it possible for him to carry out his plans—a work that Mr. Dahl's business associates believe will be of great value to the community. As they see it, both from the standpoint of civic benefit and business progress, the transit problems must be solved.

For more than two years now Mr. Dahl has devoted practically all of his time to this question and he has built up confidence in his ability and in his policies. On the occasion of his election as chairman of the executive committee Mr. Dahl said that he assumed the city officials would endeavor to co-operate with the officers of the company to the end that transit conditions might be improved. As for the public, his attitude has been to use all of the present resources of the company to improve the service and to satisfy the public as nearly as it is humanly possible to do so.

Charles Hayden has been elected to the board of directors and the executive committee of the railway.

John Whitsell Retires

John Whitsell, operating manager of the Winnipeg Electric Company, Winnipeg, Man., since 1921, has retired from the railway field and gone to California with his family. His career did not begin with his assumption of duties as manager of the Winnipeg property, for it was in 1891 that he entered upon his utility work. In that year he joined the forces in the car service department of the Sioux City Traction Company, Sioux City, Iowa, now known as the Sioux City Service Company. Six years later Mr. Whitsell served on the Suburban Railroad, Chicago, as a shopman, later advancing to master mechanic and superintendent. When the County Traction Company, Chicago, combined with the Suburban Railroad to make the Chicago & West Towns Railway he was made general superintendent. At the time he went to Winnipeg he was general superintendent of the Chicago & Interurban Traction Company.

Charles H. Allen of Stone & Webster, Boston, has been appointed to a new position, comptroller Chicago Surface Lines, created by the board of operation. He will have entire charge of the financial affairs of the company.

J. P. Hudson has been appointed auditor of the Niagara, St. Catharines & Toronto Railway, effective Dec. 1, 1924. His headquarters will be at St. Catharines, Ont.

F. R. Harrington is secretary and treasurer of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., and W. J. Raidt is auditor. These duties were formerly performed by J. R. Abercrombie. D. C. McClure has succeeded R. W. Curran as general superintendent and purchasing agent.

E. W. Allen is the new engineering assistant for Francis C. Pratt, recently appointed vice-president in charge of manufacturing of the General Electric Company, Schenectady, N. Y. Mr. Allen was appointed manager of the engineering department of the company in April, 1924. He entered the employ of the company in January, 1901, in the test department in Schenectady. He was appointed engineer of the Chicago district in September, 1911, and was made assistant district manager a few years later in addition to his duties as district engineer.

Joseph A. Clair, for many years with the New York Railways, New York City, but more recently with the Yellow Cab Company, has been appointed claim agent of the Fifth Avenue Coach Company, New York. Mr. Clair entered railway work with the Eighth Avenue Railway, New York, in 1898 as a conductor. He pushed forward through the position of starter, inspector, assistant superintendent and general inspector for the superintendent of transportation of the New York Railways organization. In 1910 he joined the legal department of the New York Railways as transfer expert. Later he was made chief investigator, in which capacity he continued until February, 1923, when he took charge of the credit department of the Yellow Cab Company sales agency.

John O. Williams, depot master at the Halsey Street depot of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., has been appointed acting division superintendent of that depot. Mr. Williams' appointment follows the transfer of Division Superintendent R. A. Masters to the Fresh Pond depot, to take the place left vacant by the death recently of Division Superintendent Frederick J. Frey. Mr. Williams has been in the service of the Brooklyn company for more than thirty years.

H. F. T. Erben has been appointed assistant vice-president on the staff of Francis C. Pratt, vice-president in charge of manufacturing and chairman of the manufacturing committee of the General Electric Company, Schenectady, N. Y. Mr. Erben will continue as vice-chairman of the manufacturing committee. He has been identified with the General Electric Company since its early days. During 1914 he was made engineer of the Schenectady works and in March, 1916, was appointed assistant manager. Following Mr. Emmons' retirement as works manager in 1920, Mr. Erben assumed full charge of the works as manager, a position which he held until Jan. 1, 1923, when C. E. Eveleth was made works manager.

Obituary

Walter E. Harrington

Walter E. Harrington, for many years active in electric railway operation and recently consulting engineer in New York, died Dec. 12 at the age of 58. He was graduated from the University of Pennsylvania in 1887 and from 1896 to 1904 was vice-president and general manager of the Camden & Suburban Railway. After the lease of this railway to the Public Service Corporation of New Jersey Mr. Harrington was connected with the operating department of J. G. White & Company, New York, and later was president and general manager of the Eastern Pennsylvania Railways, Pottsville, Pa. In 1904-05 Mr. Harrington was a member of the executive committee of the American Street Railway Association. He also served on several association committees.

Frank Dabney, manager of the Puget Sound Power & Light Securities Company, of the Stone & Webster organization, and a notable figure in Seattle's business and community life, died in Seattle on Dec. 12, following a short illness contracted immediately upon his return from an extended Eastern business trip. Mr. Dabney went to Seattle in 1900 with the Stone & Webster organization. Years ago, when the Stone & Webster interests owned and operated the railway lines in Seattle, Mr. Dabney was named assistant treasurer. At that time the company was known as the Seattle Electric Company. This position, as well as that of manager of the Puget Sound Power & Light Securities Company, he held up to the day of his death. He was also assistant treasurer of the Diamond Ice Company and the Renton Coal Company, subsidiary companies of the Puget Sound Power & Light Company. Mr. Dabney was born in 1853 at Fayal, Azore Islands, where his father was American vice-consul. After obtaining his early education at Fayal and Boston, including a course at the Massachusetts Institute of Technology, Mr. Dabney entered the foreign shipping business. Later, for a time, he was identified with coal mining, timber and railroad interests in Ohio and elsewhere.

Thomas Benton Clawson, one of the organizers and the first president of the Warren Street Railway and the Warren-Jamestown Street Railway, Warren, Pa., died at his home in Warren Dec. 11. He was 79 years old.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Official Washington Sees Good Business Ahead

Public psychology is now inclining strongly toward an expansion of business. There is economic confidence and optimism everywhere. We may expect an active year in all lines of business during 1925. These are thoughts expressed by a high official in Washington.

Some think that we are at the beginning of an inflation movement. Official Washington is watching this very carefully for it was commented that this country cannot go through another cycle of inflation and deflation without wrecking some of the public organizations, and the Federal Reserve system would probably be the first. Thus no real inflation is likely to be allowed to go beyond the early stages.

There is also the further suggestion that we will not have any inflation because that does not come until after there has been total employment for a considerable period. We are not yet up to full capacity in our production and there is still a surplus of labor. The New York Stock Exchange was observed to be distinctly not an indicator fundamentally of business conditions. The recent sustained upward trend of the market was attributed, in the first instance, to the election, but beyond that to the fact that wealthy people cannot afford to sell their stocks at the present large profits on account of the necessity to show these profits in their income tax statement this year. This has caused a shortage of supply of stocks, which has tended to keep the market up.

In view of the great interest which has been shown by business and the public generally in the special studies made by the Department of Commerce in Washington, it may be said that the average of intelligence with respect to business matters generally is showing a distinct advancement. The Secretary of Commerce recently said, in commenting upon this, that "If we can develop in our people a high sense of

Metal, Coal and Material Prices

Metals—New York	Dec. 23, 1924
Copper, electrolytic, cents per lb	14.85
Copper wire base, cents per lb	16.875
Lead, cents per lb	9.60
Zinc, cents per lb	8.02

economic understanding, we would rid ourselves of a large part of the problems that daily confront us." Such general understanding of economics will certainly tend toward governmental as well as economic stability.

Two New Interlocking Plants

The Interborough Rapid Transit Company has placed an order with the Union Switch & Signal Company for the materials required to install an electro-pneumatic interlocking plant at 149th Street, New York City. The machine will be of the Model 14 type, having 24 working and 3 spare levers, equipped with lever lights on all switch levers. Electro-pneumatic high and dwarf signals will be used to direct traffic in the interlocked area, the switches being operated by a total of 16 switch and lock movements equipped with style "C" cut-off switch valves. These materials will be installed by the Interborough company's regular signal construction forces.

Another important installation will be made by the Union Switch & Signal Company on the Boston Elevated Railway, Boston, which has ordered materials for the installation of an electro-pneumatic interlocking plant at Tower "F," Dudley Street. All electric energy employed at this plant will be alternating current. The layout embraces 20 color light signals and 14 switches to be controlled from the interlocking machine, which will have 15 working levers. A track model having 47 lights is being provided to indicate to the towerman the occupancy by trains of the tracks through the plant and in the territory south to Eggleston Square station and north to Dover Street Station.

Laconia Car Company Has Lower Profit

For the year ended Sept. 30, 1924, the net income of the Laconia Car Company, Boston, Mass., after interest charges was $4,753, against $237,254 in the preceding year ended Sept. 30. The total income amounted to $5,710 for the fiscal year ended Sept. 30, this year, compared with $313,615 for a similar period of 1923. Current assets at Sept. 30, 1924, amounted to $839,822 and current liabillities were $34,871, leaving a net working capital of $804,951. This item last year was $678,596.

Rolling Stock

New York Central Railroad, New York, N. Y., has ordered seven electric switching engines and two electric freight locomotives from the General Electric Company.

Atlantic Coast Railway, Asbury Park, N. J., through the Atlantic Coast Transportation Company, a subsidiary, has purchased 17 new buses to be used along the New Jersey coast cities.

Lewisburg & Ronceverte Electric Railway, Lewisburg, W. Va., according to R. M. Bell, general manager, is planning for the purchase of a gasoline motor car which will be used for freight service.

New York State Railways, Syracuse, N. Y., expects to buy four more buses for relief purposes. A number of motor trucks will also be purchased for the establishment of a freight service between Syracuse and cities within a radius of 100 miles.

Track and Line

Pennsylvania Railroad, New York, N. Y., has been ordered by the Board of Public Utility Commissioners of New Jersey to provide a switch connection between its tracks and the proposed carhouse and shops of the Trenton & Mercer County Traction Corporation, Trenton, N. J. The railroad refused to lay the switch, claiming that it had leased ground there to a lumber company.

Southern Public Utilities Company, Charlotte, N. C., is rebuilding ¾ mile of track on Belmont Avenue incident to the paving of that street.

Municipal Railway of San Francisco, San Francisco, Cal., has been authorized by the Board of Public Works to launch the $500,000 Judah Street extension. The board has authorized immediate improvement of 10 blocks on Judah Street between Thirty-first and Forty-first Avenues in preparation for laying tracks from the ocean along Judah Street to Cole and Carl Streets. This extension will connect with Market Street by way of the Eureka Valley-Sunset Mission tunnel.

Power Houses, Shops and Buildings

Columbus Railway, Power & Light Company, Columbus, Ohio, is having plans drawn for a three-story repair and service building to cost $300,000, with machinery and equipment. It will be devoted to the repair of rolling stock, company automobiles, service cars and trucks.

New York, N. Y. — The Board of Transportation recently awarded to the Lustbader Construction Company, Inc., the contract for the construction of the foundations, retaining walls and embankment for the Corona Storage Yards on the Flushing subway at Hewitt Avenue and Riverside Avenue, Corona. The contract was for $235,934, which was the lowest bid received. The yards are designed to accommodate 200 cars of either the Interborough or B.-M. T. type. When completed the yards will have capacity for 700 cars, in addition to space for inspection sheds. The yards cover an area of twenty acres and under the terms of the contract will have to be ready for occupancy within a year.

Trade Notes

Stockbridge Machine Company, Worcester, Mass., has appointed the following direct sales representatives in their respective territories: D. J. Normoyle and Starr Equipment Company, in the Liberty Building, Philadelphia, Pa.; A. B. Starr in the Anott Building, Pittsburgh, Pa.; D. E. Morand Machinery Company, at 8784 Quincy Avenue, Detroit, Mich.

Norma-Hoffmann Bearings Corporation, New York, N. Y., has moved its factory and general offices to its new plant at Stamford, Conn. The Long Island City office has been discontinued and all shipments will now be made from the Stamford plant.

O. M. Bostwick has resigned as New York representative of the publicity department of the General Electric Company and will probably resume his activities in the technical publicity field in New York City.

New Advertising Literature

Roller-Smith Company, New York, N Y., has issued Bulletin No. 530 illustrating and describing its new double-pole "interlocked trip" breakers and its new "shock-proof" circuit breaker. Data are included pertaining to different types of circuit breakers for different applications.

General Electric Company, Schenectady, N. Y., has issued Bulletin No. 48732, "Electric Equipment for Cranes." This is an attractive 35-page leaflet, well illustrated with photographs, diagrams, tables and charts. It discusses the subject thoroughly, with particular reference to crane motors, control and brakes. Information is given on operating characteristics, and types of standard motors are listed in the bulletin.

Crouse Hinds Company, Syracuse, N. Y., has issued folder No. 15 and bulletin No. 2058 describing "Wedgtite" pipe hangers. How pipes are clamped to or suspended from structural shapes is described.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued a new publication called "The Cleveland Railways—The Story of Its Operation and Maintenance." This book was prepared with the cooperation of officials of the railway and describes the entire system. The introductory chapter is headed "The Tayler Plan—Its Evolution and Provisions" and briefly relates the early traction history in Cleveland. Chapter I, "Track and Overhead Systems," describes briefly the practice and policies of the Cleveland system. "The Power System" is the title of Chapter II. This describes in detail the automatic substation practice on this city system, which enjoys the distinction of having used the first large capacity two-unit substations for metropolitan areas. The various types of cars in use at the present time are described in Chapter III, which also contains several paragraphs about the service. The Harvard Shops, which have always caused much comment because of their completeness, are described by departments in Chapter IV. Chapter V is devoted to the operating stations. The entire book is profusely illustrated. Copies of the book, known as Special Publication 1703, may be obtained free of charge from any Westinghouse district office or from the publicity department at East Pittsburgh.

Better Public Relations, Better Service and Better Income—Our 1925 Resolution

"Boys!", said Big Bill, the Master Mechanic, "Doughboy Dan, our Transportation Engineer and myself have just left the General Manager's office. He paid all of us a fine compliment for the splendid progress we have made during the year on better Maintenance and Service, and has approved our plans for the coming year, but in addition to that, he wants us to get aboard of the Company's program for Better Public Relations and Increased Revenue. He said that the homes of every one of our men should be a *broadcasting station*, sending out constructive, helpful information about the Company and what we are accomplishing among their neighbors and people with whom they come in contact, and that our Staff Leaders should develop the ability to give talks in their neighborhood before various Civic Associations and Clubs. Doughboy Dan has been assigned the duty of developing this activity in our department. Dan, tell them what your plans are."

Dan stated: "The first thing I suggest is that we read and digest the Westinghouse Co-operative public advertisements that have been put out the last few years, such as '*Jammed*,' '*Street Cars Build Homes*,' '*You Need Street Cars*,' '*The Wheels of Progress Are Under Your Street Cars*,' and the like. These ads are highly educational and informative. Another thing to grapple with is Freight Haulage on our Interurban lines. Westinghouse specialists have been doing a remarkable amount of study and co-operative service on this. Each of us should get a copy of Westinghouse Special Publication No. 1634 on Freight Haulage. I am also going to get our Educational Directors busy on a special course of training on public speaking and the economics of our transportation business."

64th Volume Indexed

WITH the completion of Volume 64 of ELECTRIC RAILWAY JOURNAL this week, covering the last six months of 1924, the index for this volume is bound in as an integral part of this issue. This has been a feature of JOURNAL service for many years. It is well understood by the older subscribers of the paper, who keep the indexes available so as to facilitate reference to the volumes.

For those who bind the JOURNAL in permanent form the index section also provides the title page. It should be placed in the front of the volume. But in any event the index should be kept handy, for its references will be found of value to every subscriber whenever information is needed regarding events or practices chronicled during the past six months.

Reference is made easy by classification of articles by subjects as well as by cities and companies. The principal subjects are classified in a list of key words printed ahead of the alphabetical index. Then, too, articles are cross-indexed so that there are several ways by means of which they may be located quickly.

Number of Copies Printed, 6,250

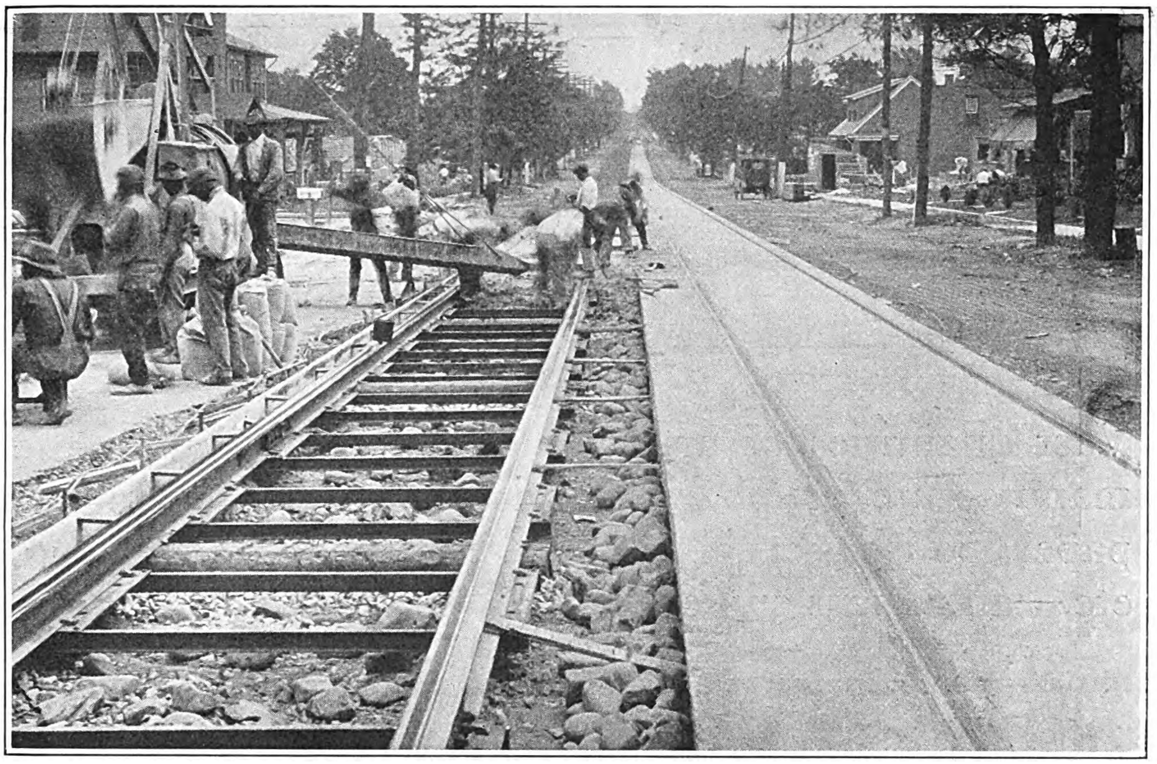
Automotive Air Brakes Sell Transportation



THE FIFTEENTH YEAR

37% More Twin Ties sold than in 1923.

80% Sold to Companies with upwards of 13 years experience with Steel Tie Construction.

20% Sold to new customers.

There is a definite relation between this record year for sales of Steel Twin Ties and Track Costs for initial installation and maintenance on over 147 properties in the United States and Canada.

While the complete presentation of this data in our book, "Steel Tie Track Construction" is persuasive, it is not dangerous.

Expose yourself to it by directing us to mail it to your office or home.

UNA RAIL BONDS

Now! Applied by "Gas"

The Long-life, Highly Conductive Copper to Steel Welded UNA Bond is now applied by either the Electric Arc or Gas Flame methods.

The UNA Weld.

No matter which method is used the resulting copper to steel weld is identical. The same bonds and molds are used, the only difference in either method being the source of heat. In one case it's the heat of the carbon arc, in the second case it's the heat of the arc drawn by the metal electrode and in the third case it's the heat of the gas flame (oxy-acetylene).

The UNA Mold.

The UNA Mold positions and holds the bond head against the rail. *It retains the molten metal until the weld forms. The mold not only simplifies the bonding for the welder but also speeds up the process.*

UNA—The Universal Bond.

With one stock of standard UNA Bonds and Molds either of the three methods of Bonding may be used. If electric power is available either of the electric arc methods may be the most suitable. For pickup bonding or if power is not available, the gas flame method will meet your bonding needs.

As the same bonds and molds are used, UNA Bonding offers a *Universal Bonding Method* that economically meets every bonding condition.

The Exit Doors Are Automatic

On Chicago's Latest Type Multiple Unit Cars!

Of course
NATIONAL
PNEUMATIC
DOOR ENGINES
are used

Here's the story!

OVER two years ago, Chicago installed in addition to "Safety Car Devices Equipment," *automatic* doors on 45 double truck one man cars. Today they are putting them on 100 new cars, designed for single and multiple unit operation in congested districts. This is a tribute not alone to the success of the Automatic Door, but also to another successful adaptation of National Pneumatic Equipment.

And furthermore, National Pneumatic Door Equipment is standard in Chicago, as it is in nearly all the leading American cities.

children to school in Mack Buses!

Ask any of the mothers in your community how much thought they have given to the problem of getting the children off to school. They'll tell a story of worry and anxiety.

For in most cases small children can not be allowed to travel alone in crowded cars. Either mother must go along, or the kiddies must walk,— and nine times out of ten the kiddies walk.

How welcome would be a school bus service,— with trusty, safe, dependable Mack Buses? And a driver who would take good care of the little ones from door to door.

Mothers relieved of all anxiety would bless the railway company,— goodwill well worth having. Thousands of children riding, where previously they had walked would mean a substantial increase in fare-box receipts.

All through a comparatively small investment in equipment, which because of its flexibility, could always be used to utmost advantage.

Progressive electric railways are turning more and more to Mack Buses for auxiliary service of this kind. They find in Mack Bus design and exclusive mechanical features, that solid dependability so vital whether the service be taking the kiddies to school, feeding an outlying district, or helping ease congested car lines in busy sections.

From bumper to tail light, the Mack is all bus; — built for utmost efficiency and economy in bus operation.

For example there is the sturdy long-life Mack engine.

The specially designed low bus chassis.

Wide tread assuring safety and permitting a short turning radius.

The Mack dual reduction drive axle, especially designed to give maximum road and underbody clearance.

The Mack transmission with ground gears.

Dual system of brakes on rear wheels and drive shafts.

The Mack Shock Insulator. (All spring ends are embedded in rubber shock insulator cushions, assuring ease of riding and less wear.)

The kiddies are doubly safe in a Mack Bus.

Cambria Rolled Steel Car Wheels and Forged Axles

CAMBRIA ROLLED STEEL CAR WHEELS for Electric Service are made at the Johnstown Plant of Bethlehem Steel Company by a combination rolling and forging process. This process thoroughly works the steel and gives an exceptional refinement in structure which does not readily develop flat spots. For this reason Cambria Rolled Steel Car Wheels will give you the longest service at lowest cost.

CAMBRIA FORGED AXLES for Street, Interurban, Subway and Elevated cars, and Armature Shafts for Electric Service are made in the Axle Plant to meet any reasonable specification. They can be furnished treated or untreated; solid or hollow bored; smooth forged only; rough turned all over; rough turned on journals and wheel seats; or finished turned on journals and wheel seats.

We will also mount wheels on the axles if so desired

Specify Cambria Rolled Steel Car Wheels and Forged Axles on your next order.

Large stocks of wheels and axles in standard sizes assure prompt shipment.

CONSOLIDATED
CAR-HEATING
COMPANY

Listen in on Station CCH

This is station CCH, the Consolidated Car Heating Company, broadcasting its usual weekly program to the electric railway industry, direct from its factory, at Albany. This station is operating on a wave length of satisfaction.

Underwriters approval—

ON CONSOLIDATED ELECTRIC CAR HEATERS

IT MEANS SOMETHING to you to know that 26 different types of Consolidated Electric Car Heaters have been inspected and approved by the Underwriters Laboratories Maintained by the National Board of Fire Underwriters.

Critical inspection of Consolidated Electric Car Heaters reveals many safety features which inspire confidence. No red-hot wires. Asbestos safety cord through coils binds coils securely to porcelain insulator. Every coil used is accurately measured for electrical resistance. Cases are tamper and fool-proof.

Station CCH now signing off until this time next week when the broadcasting program will be resumed.

Good day!

Skull Crackers

Smash! Crash! Bang!

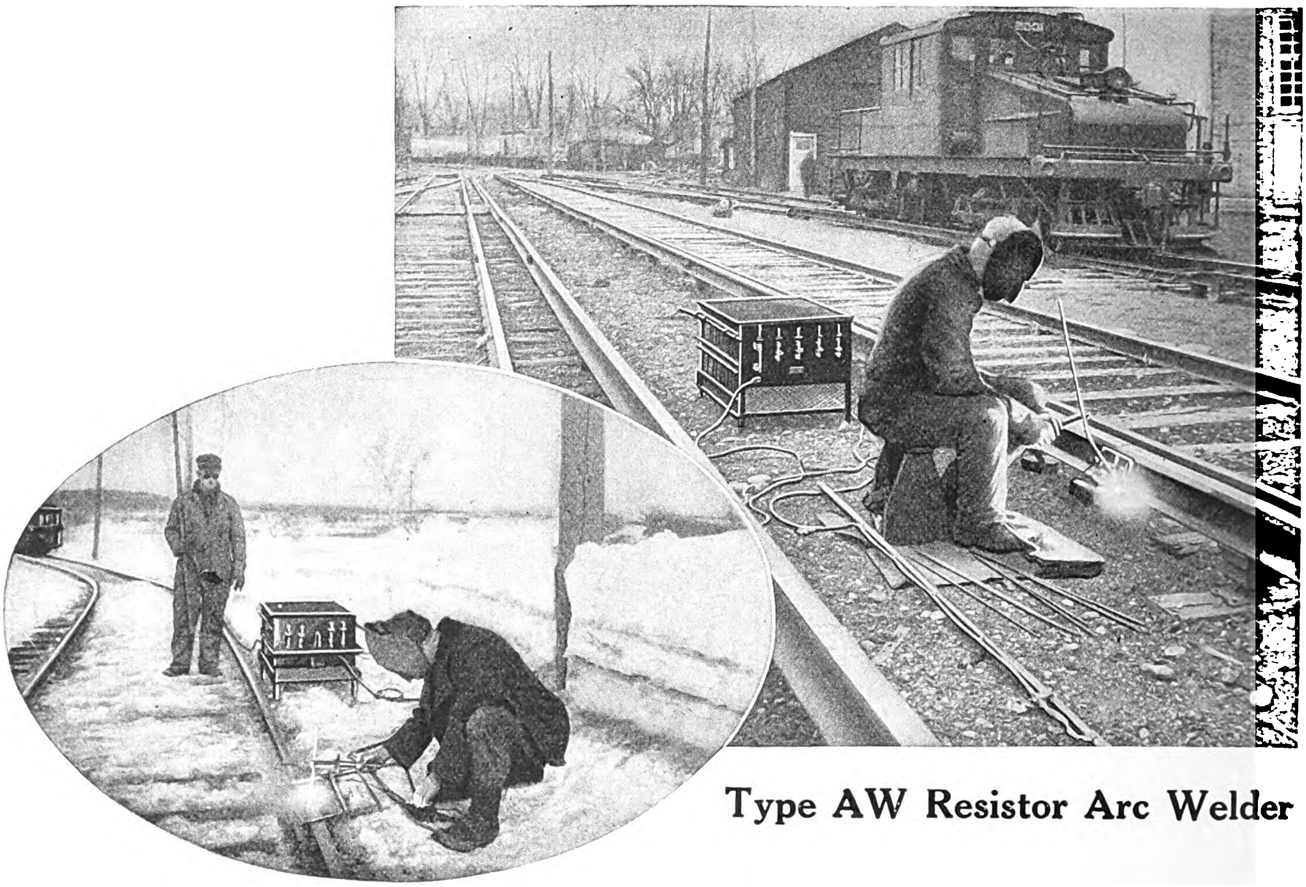
THE hammer blows of the maker's tests are repeated a thousand times a day as car wheels pound over track crossings, over frogs, switches and low joints.

"Skull cracker" is the suggestive name by which this testing equipment is known. Tests on Davis "One-Wear" Steel Wheels made with this instrument of torture show that they are able to withstand the impact and shocks of service, without chipping or cracking, better than any wheel made.

Records of Davis "One-Wear" Steel Wheels in operation on scores of roads back this up in actual service.

American Steel Foundries
NEW YORK CHICAGO ST. LOUIS

DAVIS
"ONE-WEAR"
STEEL WHEELS



Type AW Resistor Arc Welder

Type AW Arc Welder

- —weighs 140 lbs.
- —does good work in quick time at minimum cost
- —withstands wear of weather
- —specially designed for welding rail bonds, fish plates, etc.
- —operates on 400/650 volts, and welding current can be varied by 15 ampere steps to 60 to 200 amperes.

"It recommended itself on account of its lightness"

—writes a user of the AW Arc Welder. "It is the lightest machine for doing this type of work that we know of, and for the use to which we put it this lightness is a distinct advantage on account of the number of set-ups per day over a considerable stretch of track.

"It has been in service about a year and has performed its work very satisfactorily. We use it on maintenance work where the bonds to be applied are more or less scattered—and with two men put on 60 to 70 bonds per day."

Just hook the Type AW Arc Welder to a trolley wire and you get service that satisfies.

Light weight—easily handled

Ask the G-E sales office nearest you for complete information on your electric welding requirements.

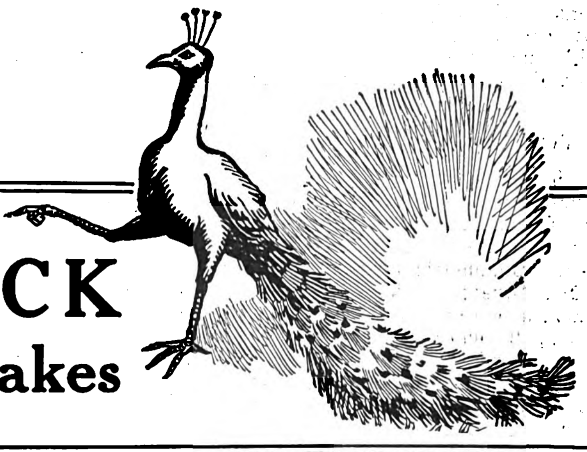
Staffless Brakes



Reasons why Peacock is preferred—

Maximum Braking Power
Ample Chain Winding Capacity
Least Platform Space
Simple Operation
Unfailing Reliability
Low Maintenance Costs

You'll find them all Important

Nearly quarter of a century building and installing hand brakes has established beyond question, the safety and reliability, the long satisfactory life and low maintenance costs of Peacock Brakes.

Due to their correct construction of properly selected materials, Peacock Brakes involve practically no expense for repairs and replacements.

The rapidity with which a Peacock Staffless Brake will bring a speeding car to a dead stop inspires confidence on the part of the motorman because he knows after a few trials that he can depend on the Peacock in emergencies.

Our engineers have specialized on the design of hand brakes and they have considered the problem from all angles. Peacock Brakes are specified by experts in rolling stock who do not depend on some one else's say so.

Peacock Brakes are designed with the "*safety* first" idea.

Write us for details.

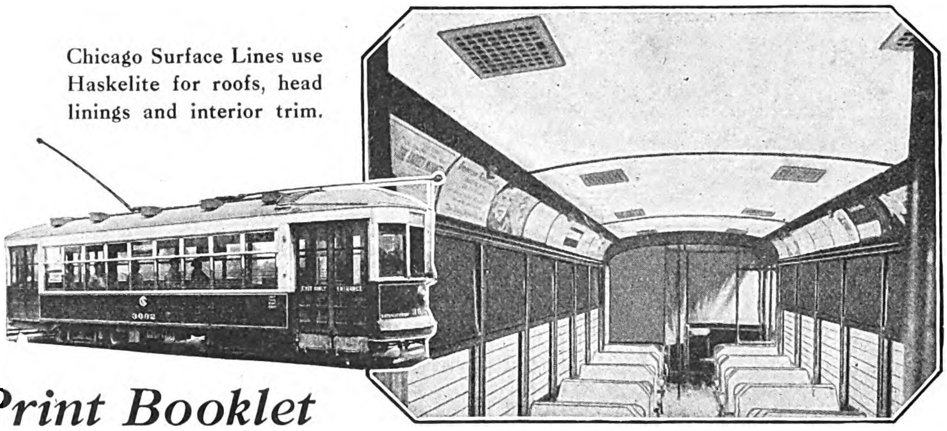
Car Roofs of HASKELITE are 30% lighter

Chicago Surface Lines' last 100 cars, soon to go into service, have Haskelite roofs, truss planking and bulkheads. In every location it saves weight, increases strength and improves appearance. Reduced weight lowers the center of gravity, improves riding qualities and lessens operating costs as much as $50 per year.

PLYMETL

Is Haskelite with steel faces, making superior side panels, vestibule linings and letter boards. Besides being very durable, it posesses great heat insulating value and deadens sound. Resisting indentation, it is easier to keep in good condition than steel.



Chicago Surface Lines use Haskelite for roofs, head linings and interior trim.

TIMKEN

A Year of Progress—

Many interesting developments, many improvements in motor coach designing, have marked the calendar year now drawing to a close.

Timken-Detroit has participated in —and contributed to—this progress. Therefore, although the advanced types of motor bus differ in many respects, they agree in one—that their axles are built by this company.

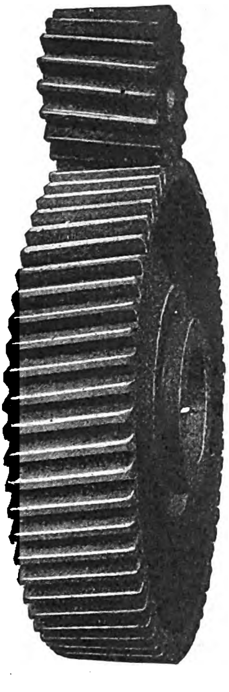
Is a noiseless, vibrationless gear possible?



Nuttall Helical Gear and Pinion

You have had visions of a gear — a quiet, smooth acting gear that would work without constantly jarring loose nuts, bearings, insulation and generally shortening the life of the motor and even the car itself.

This ideal has been realized in the Nuttall Helical Gear. This gear is virtually noiseless. It has been proven to be the smoothest, quietest and most enduring type of gear that can possibly be made.

If you really want noiseless cars and less maintenance work, investigate Nuttall Helical Gears. Our Gear book tells you all about them. Write for it.

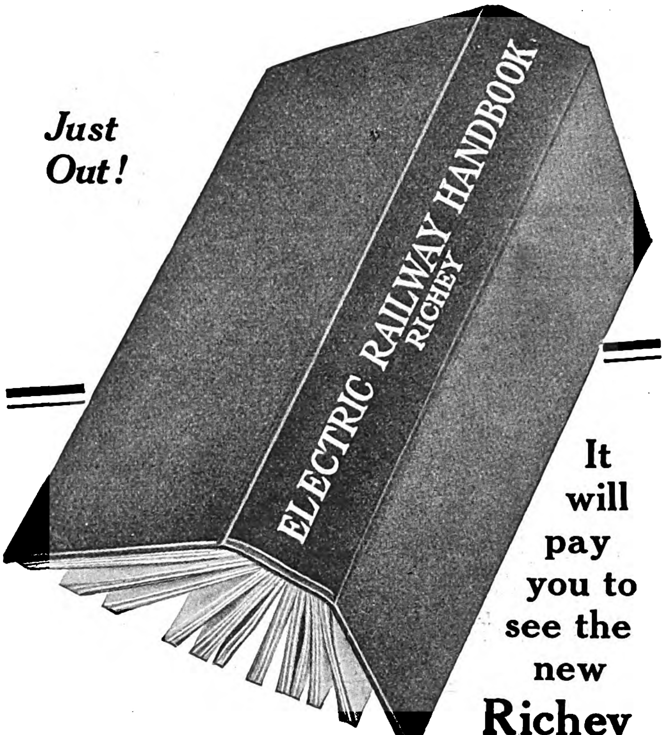
Just Out!



It will pay you to see the new Richey

The new 1924 Richey covers the latest developments—describes new methods—records changes in theory and practice. It covers every phase of electric railway work from Roadbed and Track to Signals and Communication. Therefore you should see

The thoroughly Revised Second Edition of

RICHEY'S
Electric Railway Handbook

798 pages, flexible, pocket size, 600 illustrations $4.00 net, postpaid.

By Albert S. Richey

Consulting Engineer, Professor of Electric Railway Engineering, Worcester Polytechnic Institute

Electric railway executives, engineers and operating men have long respected Richey's ELECTRIC RAILWAY HANDBOOK as the one great pocketbook of practice data, formulas and tables in the electric railway field.

Every Railway Man has a need for Richey

It should be in the reference library of every electric railway in the country. A few new ideas gleaned from one section of this helpful handbook will repay the small price of the book over and over again.

CHAPTER HEADINGS

1—Roadbed and Track
2—Car Houses and Shops.
3—Train Movement
4—Railway Motors
5—Controlling Apparatus
6—Current Collecting Devices
7—Trucks
8—Braking
9—Cars
10—Transmission and Distribution
11—Signal and Communication

Examine the new Richey for 10 days FREE

See this book for yourself. Examine it free. Look up some special topics of immediate interest to you. You can keep it or send it back as you think best. On that fair basis—send the coupon off today.

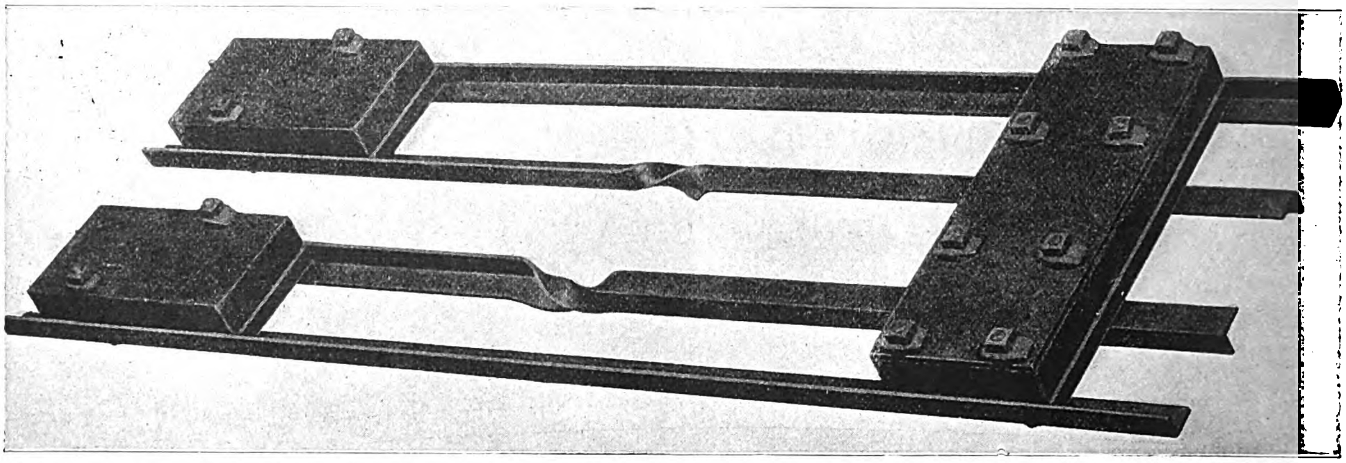
DAYTON



Joint Tie

Strengthen the joint and you get rid of many track troubles. The Dayton Resilient Joint Tie is designed to give additional strength to the most vulnerable part of the track, by supporting both rails on the same level and preventing battered and sunken rail joints.

Welding the rail to the top plate of the tie provides excellent current return. No other bonding necessary.

Thousands of these Joint Ties are in use. Write us.

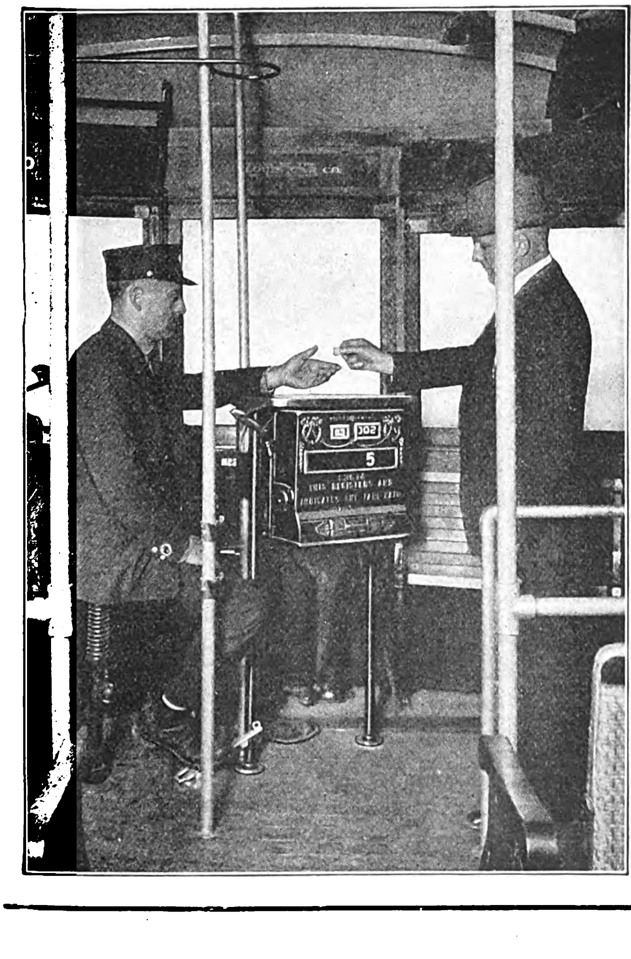
"The Birthplace of the Safety Car"



Quick Accurate Permanent

A Record of Each Sale When the Sale is Made

The sale of electric railway transportation is strictly a retail business proposition and should comply with those methods which have been found most successful in other lines of merchandising.

The only safe method is to mechanically indicate and record the amount of each sale in the presence of the purchaser at the time the sale is made.

Ohmer Fare Registers indicate and record the exact amount and class of fare paid at the time it is paid. They apply to electric railroading the correct methods which have brought success to countless retail merchants.

N-L Type "AA"
Bus Ventilator

45 Out of 54!

On 45 of the 54 buses exhibited at the Atlantic City Convention N-L Ventilators were used. This shows what the foremost bus body builders think of N-L Ventilators.

Many leading street railways have standardized on them also.

It is no longer necessary to argue for the advantages of good ventilation. It is now universally recognized as a necessity for profitable car and bus service.

POSITIONS WANTED

AUDITOR, broad and thorough experience in financing and accounting; all branches railway, electric and gas utilities, open for engagement. Possess initiative and capable of assuming full control of all accounting matters. PW-758, Electric Railway Journal, Old Colony Bldg., Chicago, Ill.

EXECUTIVE, nine years manager of local street railway system in industrial town seeks larger opportunity. Thirteen years' prior experience in engineering, transportation and executive departments of large trunk line railroad. Has given special study to analyzing transportation problems and operating costs. PW-761, Electric Railway Journal, Real Estate Trust Bldg., Philadelphia, Pa.

EXECUTIVE—Twelve years' experience in engineering and operation, city and interurban; first-class record and references. PW-757, Elec. Ry. Journal, 10th Ave. at 36th St., New York.

GENERAL superintendent of one of the largest electric railway systems, interurban and city, desires a change. Has come up through the ranks. Knows both electric railway and bus business. Capable of handling combination property. Highest references furnished confidentially. Open to any stable proposition. Wide experience with men in all departments of the business. If interested please give me an interview. Address PW-764, Elec. Ry. Journal, 10th Ave. at 36th St., New York.

MR. MANAGER, are you in the field for a superintendent of equipment or master mechanic. If so you should realize that practical experience is an important factor in successful handling of this department. 15 years in the railway field, installation, maintenance and operation. PW-763, Elec. Ry. Journal, Real Estate Trust Bldg., Phila., Pa.

POSITION wanted by young man, thorough accountant, ten years' public utility experience middle west, six years as auditor, secretary and treasurer and assistant to manager; familiar with railway, bus, gas and electric departments. Now employed, but desire change. PW-766, Elec. Ry. Journal, 10th Ave. at 36th St., New York.

TRAFFIC and transportation superintendent—Experienced interurban and city railway and bus operation, desire to connect with organization inaugurating bus service. PW-759, Electric Railway Journal, Leader-News Bldg., Cleveland, Ohio.

WANTED: Position with street railway company by master mechanic, 18 years' experience. Best of references. PW-765, Elec. Ry. Journal, Old Colony Bldg., Chicago, Ill.

**In Small Lots
As Well As Large**

THERE is a class of rail buyers, occasionally in need of only small tonnages, who are paying a premium on their purchases elsewhere because they believe that we do not seek their patronage.

We maintain a large organization to give efficient service on small orders. Our tremendous volume gives us unequaled buying power and saves our clients money regardless of the tonnage required.

Immense stocks at strategic distributing points provide complete assortments near you. This adds a saving in freight to our already unbeatable prices.

Next time you need rails, let us know your requirements.

We guarantee the same prompt, efficient service to all.

A four-tool pneumatic tamping gang at work on a track repair job

Pneumatic Tie Tamping

The most efficient and economical way to tamp track

Ingersoll-Rand Pneumatic Tie Tampers speed-up track tamping. Four men with these machines will tamp more track and do a much better job than twelve to sixteen men working with hand picks and bars. And the track stands up two to three times longer than when tamped by hand.

Ingersoll-Rand Portable Air Compressors, for tie tamping service, makes possible other savings through the use of air operated Paving Breakers, Rail Drills, Woodborers, Spike Drivers, Grinders, etc. Ask for complete information on the uses and savings of these portable compressors — the tamping outfits.

Carey Elastite Rail Filler is made to fit any rail section.

Omaha and Council Bluffs Street Railway Bridge, Omaha, Neb.

Gilbert Ave., Viaduct, Cincinnati, Ohio

Make the track as watertight as the bridge-deck!

Engineers take every precaution to waterproof bridges and viaducts, yet there has always been a vulnerable point between the track and the bridge paving through which water and frost might enter, resulting in the weakening of the structure and concrete staining.

But now car-tracks can be made just as water-tight as the bridge-decking. On the Omaha and Council Bluffs street railway bridge over the Missouri at Omaha, Nebraska, and the Gilbert Avenue viaduct at Cincinnati, Ohio, Carey Elastite Rail Filler makes a water-tight and frost-tight seal between the rail and the paving. It protects the bridge, absorbs vibration, dissipates traffic-impact, prevents paving-disintegration, and reduces traffic-noise.

THE PHILIP CAREY COMPANY
53 Wayne Ave., Lockland, Cincinnati, Ohio

Elastite Rail Filler

is easy to install. A tap of a mallet sets it in the web of the rail. Carey Elastite Rail Filler is a composition of specially-tempered asphalt and fibre which is used as a resilient cushion between the rail and the pavement, absorbing traffic-impact, rail-vibration, and traffic-noise. It is preformed to fit any rail-section and is readily shaped on the job to fit any track-curve. It is unaffected by moisture or temperature changes and is enduring under all service conditions.

Carey Elastite

New City and Suburban Cars

Twenty light-weight, one-man two-man cars of this type were recently built in our Philadelphia Plant for Trenton, N. J. Ten cars include quadruple 25 Hp. motor equipment for city service, and ten are equipped with quadruple 35 Hp. motors for suburban service. Otherwise, the cars are practically identical, being mounted on Brill 77-E low-level trucks equipped with Brill Twin Swing Links, measure 44 ft. long over platforms, and seat 48 passengers.

The city cars weigh 34,476 lb. and the suburban cars 36,746 lb.

AURORA, ELGIN AND FOX RIVER ELECTRIC COMPANY
AURORA, ILLINOIS

September 4, 1924.

MR. A.P. JENKS,
Railway Department,
General Electric Co.,
Illinois Merchants Bank Bldg.,
Chicago, Illinois.

Dear Mr. Jenks:-

Noticing your adv. on the back cover of the Electric Railway Journal, August 30th issue, where your company very graciously used photographs of our cars, I thought perhaps it would be interesting for you to know that we have now had our city cars, which are equipped with the GE-264 motors, in operation one year, each car averaging approximately 4200 miles per month. Our interurbans with the GE-265 motors have only been in operation approximately nine months, averaging 5000 miles per month. Now that our summer business is nearly over, we are taking down all motors, making a complete and thorough inspection, cleaning all parts. I am certain it will be interesting to your company to know that we have not as yet had one failure in any of the GE-264 motors and only one failure in the GE-265 motors, this being occasioned by the motorman's mis-use when stuck in a snow drift with one pair of trucks off track last February.

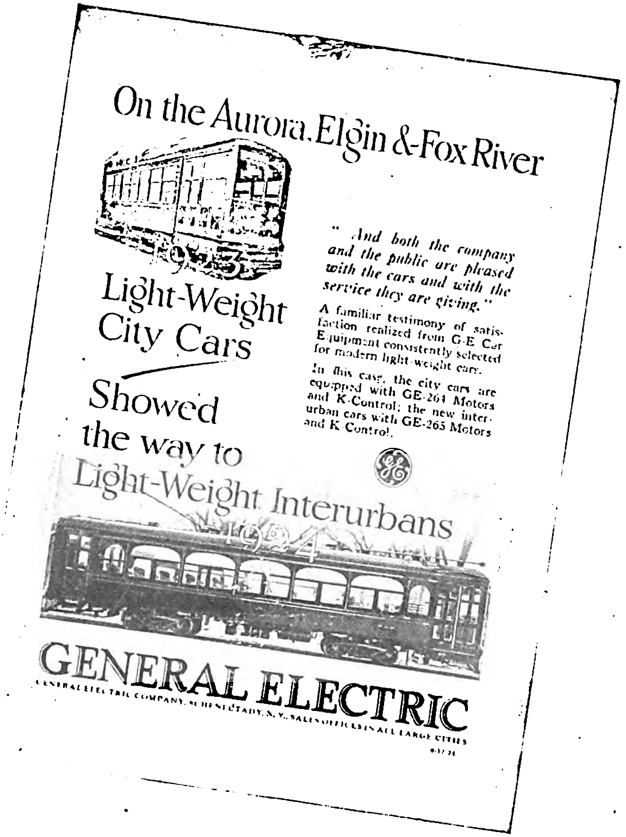
To me this is a wonderful record, where equipment on forty-seven cars has stood up as this equipment has and not suffered one failure of any description. If this information is of any value to you, you may use these figures to whatever extent you may desire.

With kindest personal regards,

I beg to remain,

Yours very truly,

GENERAL MANAGER.



On the Aurora, Elgin & Fox River

Light-Weight City Cars

Showed the way to Light-Weight Interurbans

"And both the company and the public are pleased with the cars and with the service they are giving."

A familiar testimony of satisfaction realized from G-E Car Equipment consistently selected for modern light-weight cars.

In this case, the city cars are equipped with GE-264 Motors and K-Control; the new interurban cars with GE-265 Motors and K-Control.
